NO. 1.

AN AMERICAN IN TIBET.

AN ACCOUNT OF A JOURNEY THROUGH AN UNKNOWN LAND.

AUTHOR'S PREFACE.

TIBET, separated as it is from India and China by the highest range of mountains in the world, and from Mongolia by broad and desert steppes the altitude of which renders them uninhabitable for man, has naturally remained the most inaccessible and least known country of Asia. But besides these natural barriers, the ignorance of the people; the monopolist tendencies of the sacerdotal class, the Lamas; the jealous apprehension of Tibet's real masters, the Chinese, that foreign influence and trade may displace them — these are obstacles no less serious to overcome before foreigners can enter the country.

A learned French missionary who for thirty years has been living on the Tibetan borderland, writing some years ago of Tibet, said:

What is known of the great plateau which stretches out from the valley of the Tsang-po to the Kuen-lun range? The same may be asked of the form of government, the civil and military organization, the rights of ownership, the civil and religious condition of the people, their virtues and vices, their morals and their customs. Who can speak of the geology, the mineralogy, the mines of Tibet? What is the value of its commerce, both domestic and foreign?

Instead of applying themselves to throw some light on these and many other questions, people generally, and even *savants*, have only this to say: Tibet is the poorest country in the world; it has nothing to sell, there is nothing to be gotten out of it. A convenient answer, in truth, but one which only proves that Tibet is a perfect *terra incognita*. A big volume might be written on what we do not know about Tibet; and if such a book was ever written and had the good fortune to be read, it would dispel many of our illusions.

Thus said Abbé Desgodins in 1881, and ten years have added but little to our knowledge.

Of the many attempts made within the last fifty years to penetrate Tibet none have been really successful save that of Huc in 1845, whose charming work has but little scientific or geographical value. Other travelers have gone as far as Bat'ang, on the high road between China and Lh'asa, but have invariably been stopped at that point. Prjevalsky's explorations never extended to Tibet proper, unless we apply that name to the desert and uninhabitable tablelands on the north of that country.

In northeastern Tibet foreign travelers had not been more successful. In 1884-85 Colonel Prjevalsky, with an escort of fourteen Cossacks and sixty-five camels, was unable to enter it, and a few years previously Count Szechenyi and his expedition had not been allowed by the Chinese authorities to advance in this direction.

Of the great value of exploration in this part of the country it may be noted that Prjevalsky in his last work speaks of it as among the *spolia opima* of future travelers, and it is said that Stanley was so alive to it that he expressed at one time a strong desire to attempt a journey there.

Besides the attraction which travelers would naturally feel for an entirely unexplored region, this one was known, from Chinese sources, to present many features of peculiar interest. A primitive political organization; nomadic tribes, among them the Golok, the most lawless and most feared throughout the country; old and quaint customs which had disappeared from the more civilized parts of Tibet — all pointed to it as showing Tibetan culture in its early and primitive form. It was said to be a well-watered land, traversed by a number of important rivers, presenting many varieties of climate and vegetation, rich in mineral wealth, and the habitat of a great variety of wild animals, many of them unknown to naturalists.

For years I had wished to visit Tibet, especially this part of it. From the time I was a boy I was much interested in Tibetan Buddhism, and I early acquired a fairly good knowledge of the literary language. So when, in 1884, I was attached to the United States Legation in Peking, it seemed as though I might be able to carry out my plans of exploration if I could learn the spoken language, a knowledge of which, from the first, I held to be an absolute requisite for success. No foreigner spoke the language, and none of the natives whom I first met would consent to teach me, being suspicious of the use I might make of my learning. I finally gained the friendship of an intelligent Lama from Lh'asa, and with him for the next four years I studied Tibetan, giving also much of my time to the study of Chinese.

In the autumn of 1888, having resigned my position in the diplomatic service, I started on my travels to this strange land.

My whole journey from Peking through Tibet to Shanghai occupied nine months. From where I left the Ts'aidam till I reached Ta-chien-lu had never before been trodden by a white man. All this country I was able to survey, besides correcting some errors of previous travelers in the Koko-nor and Ts'aidam, and adding something to our knowledge of those little-known regions.

W. Woodville Rockhill.

THROUGH NORTHERN CHINA TO THE KOKO-NOR.

Tibet was. "No," he answered; "but it makes no difference. I'll do what I said."

What better illustration could I give of the ignorance in which we are concerning Tibet? The minister of the United States to China did not know that it was an integral part of the empire to the court of which he was accredited!

Seeing that there was no possibility of my retaining my connection with our legation and accomplishing the work of exploration on which I had set my heart years ago, I resigned my post, and in the latter part of 1888 was ready for the journey which would take me through Northern China, the Koko-nor and Ts'aidam countries, and thence whitherward, as Carlyle would say, but certainly into some part of Tibet; and so long as it was an inhabited one, it mattered little: it would be unexplored, and could not fail to prove interesting.

Travel in Northern China is accomplished in a cart, a mule litter, or the saddle. The first method is the most uncomfortable but the most rapid, the second the most comfortable but the slowest, the third the most independent but the most uncertain. The cart used

SILVER SCALES AND CASE.

ONE day in 1886, while I was secretary of the United States Legation at Peking, I took to the minister a despatch for the Secretary of State, requesting him to indorse it favorably. It was to ask for an eight months' leave of absence, without pay, to travel in Western China and Tibet. The minister read it over, and turning to me said: "I cannot give my approval to this. If you absent yourself from the legation I must have some one to take your place and do your work. But I tell you what I will do: since you are so anxious to see Tibet, I will use all my influence at Washington to have you appointed minister resident and consul-general there." I timidly asked him if he knew where

THE COURTYARD OF AN INN.

in Northern China has two heavy wheels, with wooden axle, no springs, and a body about four feet long and three broad, over which is a light framework top covered with blue cotton. Two mules driven tandem by a carter seated on the left shaft take it along at a rate of about three miles an hour, and one can make in it an average of thirty-five miles a day, even over the roughest country. It will carry about three hundred pounds of goods, and one or even two passengers; and the tighter one is squeezed in the more comfortable it will prove, for that, and that alone, will be a protection from the terrible jolting over the rough country roads. It is told in some old book of travel, in the narrative of the mission of Lord Amherst to the court of Peking, if I remember rightly, that one of his attendants died from the effects of the jolting he received during a short journey in one of these carts. But this mode of travel being the most rapid, I adopted it. Several years of experience of cart travel in China had made me bold, so that I did not fear the fate which had overtaken the Amherst mission man. Comfortably wrapped in my wadded Chinese clothes, I squeezed myself into my cart, feeling like a delicate piece of china were packed in cotton, and after a hearty farewell to the friends with whom I was staying at Peking, the carters cracked their whips, and with a shout to the mules we were off.

I had made a contract with a cart firm to supply me with two carts to take me to Lanchou Fu, the capital of Kan-su, a distance of over thirteen hundred miles, in thirty-four days. For every day over the stipulated time I was to receive two ounces of silver (two taels), and for every day gained on the schedule time I was to pay them a bonus of the same amount. This arrangement worked perfectly. I experienced no delays on the route, and reached my destination two days ahead of time.

One of the most troublesome questions to contend with in traveling in China is that of money. As is well known, the Chinese have no other currency than the copper cash, about fifteen hundred of which are worth at Peking a Chinese ounce of pure silver, called by foreigners a "tael of sycee." Silver is naturally used in commercial transactions, but as bullion only, and by weight, so every one has to have a set of small scales. The inconvenience that this weighing entails would be comparatively small were all the scales throughout the empire uniform, but such is not the case. They differ considerably from one town to another, and even in the same locality. Thus at Peking there is a government standard, a maritime customs standard, and a commercial standard. The same diversity is found over all the empire, and the consequent complications and even serious loss in exchange are a continual

vexation. Nor is it possible to escape this loss by carrying copper cash with one; for, putting aside their excessive weight, there is not even a standard cash in China. Those used at T'ien-tsin are not used at Peking; those at Peking are not current, except at a discount, at T'ai-yuan. Here I bought a very debased kind of cash, giving one "large cash" for four of them; a hundred miles farther south these small cash were at par, and even, in a few cases, at a slight premium over the intrinsically more valuable large one.

One would be inclined to think that the Chinese, a clever and profoundly commercial people, would remedy this state of things by having a single standard for cash throughout the empire, and dispose of the silver question by following in the wake of all civilized and even barbarous races in adopting a silver currency. The reason for not doing so is at once found in the profit which officials and brokers find in the existence of these various standards. Take, for example, the case of a governor of a province remitting silver to Peking. He levies the taxes, or the special tax, according to a certain standard of weight obtaining in his jurisdiction, but he has to remit it to Peking according to the standard adopted by the Treasury (*Hu-pu*); the difference — and it is often a very considerable one — will usually be found to be to the credit of the governor, and goes to improve his rather inadequate salary. Such cases could be multiplied *ad infinitum*, but the above suffices to show that those who could bring about the change are not, and probably never will be, disposed to advocate it. While on the question of the Chinese monetary system it is in order to note that the Mongols, Tibetans, and Turkestanese have never consented to use the Chinese copper cash, although it is the standard money of the realm. The first-named people use silver ingots or brick tea, the others have a silver currency of their own, of which I shall speak farther on.

I took with me about sixty pounds of silver shoes¹ and twenty ounces of gold sewed in my clothes, besides a small assortment of articles for trading and presents. The importance of making suitable presents to persons whose assistance or friendship one may have to seek cannot be too carefully considered when traveling in China and Central Asia. They need not be of such a valuable nature that one's conscience feels troubled with the thought that one has resorted to bribery; but their effect on the official mind is very marked, and

on two or three occasions, when great difficulties sprang up in my way, I had proof of their mollifying effect when bestowed, with suitable compliments, in the right quarter.

In the first stage of my journey, which took me across the western border of Northern China to the Koko-nor country, I was accompanied by one Chinese servant, a young rascal who prior to this had made a journey with Lieutenant Younghusband of the British army through Mongolia and Turkestan and thence across the Mustagh pass to India. He was of scanty assistance to me, as I lived on what food I could purchase at the inns, and, speaking Chinese myself, I did not require his services as interpreter, in which capacity he may have rendered some aid to his former master, although the "pigeon English" jargon he spoke would have required more study to understand than the most difficult dialect in China.

The route we followed between Peking and Hsi-an Fu is the great highway and artery of commerce between northeastern, central, and southwestern China, and travel over it presents no hardships: every few miles along the road one passes inns and eating-houses, and large towns are met with daily.

For the first three days I traveled through the fertile plain which stretches over the greater part of the province of Chih-li, stopping only a few hours for meals and to rest in the big straggling villages which line the way, taking advantage of the bright moonlight to push on as fast as possible to Pao-ting, the capital of the province. I found it at first somewhat difficult to accustom myself to the Chinese mode of starting in the middle of the night, — or rather as soon as the moon rises, — but after a few days I recognized the advantage of doing so, for the next stage is reached early and there are good rooms and meals to be had; while if, as most foreigners do, one leaves only at daylight, one arrives at the inn too late to get even a tolerable room and bad food. The invariable rule with Chinese travelers is to leave early without eating; after four hours' going they stop for two hours to breakfast and to feed the teams, then on again till about three in the afternoon, when the stage is reached.

Every one we passed in the night our drivers insisted were brigands, and they asked me to keep my revolver handy. To judge from the number of watch-houses and patrolmen we saw, their fears did not seem ill founded, but we were never molested. Brigandage is a popular winter occupation in Northern China; not of the "stand and deliver" or "hands up" kind, but of the sneak thief in rags and tatters and armed with a pike or old sword description. Even in the immediate vicinity of Peking, and notwithstanding the strenuous efforts of

¹ Thus called by Europeans on account of the shape of the ingots, which resemble a Chinese shoe or boat (in Dutch *schuyl*). The Chinese call those weighing fifty taels *yuan-pao*, which word becomes in Turkestan and Tibet *yambu*.

the high officials and the frequent executions, highway robbery and brigandage break out afresh every year. Poverty pushes the peasants in many cases to adopt this means of livelihood, which must present great difficulties in such a

portion of the room raised about two feet and a half above the floor. It is about six feet broad and is covered with coarse mats; the interior is hollow and receives heat from a fire built in it through a hole on the outside, or in

CAVE-DWELLINGS IN LOESS COUNTRY (FEN HO VALLEY).

thickly inhabited country with no Sherwood forests to retire to.

Pao-ting Fu is a densely populated town and an important commercial center, but it does not give one the impression of a large city, especially as the suburbs are not very extensive. The shops, though small, are well stocked with every kind of goods, both domestic and foreign, the latter being brought from T'ien-tsin by boat.

I staid at Pao-ting only a night and hurried on towards T'ai-yuan, the capital of Shan-hsi, some two hundred miles to the west. Our road at first lay through a level country, densely populated, and with every spot of arable soil under cultivation. At this season of the year (late December) it was, however, painfully bare; every blade of dry grass had been carefully scraped up to supply fuel to the *k'ang*.

The *k'ang* is such an important feature in the domestic economy of Northern China that it merits a few words of description. It is a

the front when coal is used. The heat of the fire rapidly warms the whole structure, and as very little draft is required for the small fire built under it,—generally a bundle of straw,—the *k'ang* remains warm for a considerable length of time. On it the family sit in the day-time and sleep at night, and, thanks to the genial heat which radiates from it, they do not require more than a light coverlet during the coldest nights; when one side gets cold they only have to turn over and warm it. This, however, is precisely what foreigners cannot get used to in the *k'ang*, one side roasting and the other freezing and no possibility of striking the happy medium. In parts of Kan-su the *k'ang* is nothing more than a big wooden box without any hole communicating with the outside air. In it is put a lot of dry powdered manure with a few live coals; this smolders for hours and warms the upper planks thoroughly, without any danger of breaking into a flame and igniting them.

Some sixty-five miles to the west of Pao-ting we left the plain and entered a hilly region chiefly interesting on account of its coal measures and the deposits of loess which cover it. Loess is a yellowish earth, extremely porous,

not require to be manured, and three thousand years of cultivation of the Shan-hsi and Shen-hsi loess has not exhausted it in the least. Loess beds, where they are compact and have a vertical face, are used by the people to make

PILGRIM ON THE ROAD TO LH'ASA.

and when dry easily reduced to an impalpable powder. One of its peculiar features is the perpendicular splitting of its mass under the action of the rains, forming chasms or *arroyos*, many of which are hundreds of feet deep. Its porosity has also the effect of rendering it highly suitable for cultivation as long as the subsoil is sufficiently wet to supply moisture to the roots of the plants by the tubes of the loess. Furthermore, crops planted in the loess do

cave habitations. These dwellings are frequently lined with brick, have an arched ceiling, and are sometimes two storied. The front is formed of brick, or else a sufficient thickness of loess is left to take the place of a wall. These houses are warm in winter and cool in summer, and naturally require no repairing. I once asked an inn-keeper who lived in one of them if these cave-dwellings had any particular name to distinguish them from ordinary houses. He

answered in the negative, but said they are known as houses which stand a myriad years.

Baron von Richthofen was the first geologist to propound the theory, now universally adopted, that the loess of China owes its origin to the action of wind sweeping over the treeless steppes of Central Asia, removing the sand and dust eastward, the latter finally settling in the grass-covered districts of North-western China, the Koko-nor, and even Eastern Tibet. New vegetation was at once nourished, while its roots were raised by the constantly arriving deposit; the decay of old roots produced the lime-lined canals which impart to this material its peculiar characteristics.¹

Through these loess beds I traveled with but few interruptions until I left China proper to enter the Koko-nor region, a distance of about 1200 miles. Generally speaking the traveling was most uninteresting, for the roads lay at the bottom of deep cuts and all view of the surrounding country was hidden from us.

Between Pao-ting and T'ai-yuan we passed through a number of towns, but they presented absolutely no feature of interest, nor, for that matter, do any towns I have visited in Northern China; in all are found the same tumble-down official buildings, the same small dark shops on crowded narrow streets, the same mangy dogs and lank pigs. The people differ only slightly in their language, and in some peculiarity of dress; never, however, in their longing to make the most out of you they can.

We reached T'ai-yuan Fu on the seventh day after leaving Pao-ting. It is a rather small city, its walls being about two and a half miles long by a mile and three-quarters broad, but the ground within them is closely built over, and the excellence of the houses and the general cleanliness bear witness to the well-known prosperity of its inhabitants. The people of the province of Shan-hsi, and of its capital T'ai-yuan especially, are famous throughout China as bankers, traders, and merchants. The largest banking-houses at Peking, T'ientsin, Hsi-an, and even farther north, are kept by Shan-hsi men, and traders from this province may be found all over Mongolia, at Tachien-lu on the Tibetan border, and in many other localities farther west.

The province produces little for exportation save iron and salt, and the northern portion of it is decidedly poor. There the people live principally on potatoes, which they boil and eat without so much as a little salt. In the central and southern parts cabbages, wheat bread, vermicelli, pork, and mutton constitute their food.

¹ See Richthofen's "China," Vol. I., p. 74, and Wells Williams, "Middle Kingdom," Second Edition, Vol. I., p. 303.

To the foreign traveler perhaps the most interesting spot in Shan-hsi is the great Buddhist sanctuary of Wu-t'ai shan, "The Five Table-mountains," a few days' journey north of the capital. In 1887 I visited this place and found it quite as attractive as it had been pictured to me by natives who had lived there. On a low hill in a narrow valley surrounded by high peaks, on one at least of which lies perpetual snow, and down which flows a clear mountain brook, stands a Buddhist sanctuary sacred to Wen-shu P'usa, the Indian Manjusri. From afar its bright green-tiled roof, on which rise golden spires, its red walls, and the dark evergreens growing around it, attract the eye. Near this most sacred shrine, but lower down the hill, are other temples, in one of which rises a great white pagoda with golden spire. Under this monument are said to be body relics of the Buddha Sakyamuni, brought there in the first century of our era by the Indian missionary who introduced Buddhism into China. In another of the temples there stands a chapel some thirty feet square and over fifty feet high, entirely made of the finest bronze exquisitely chased and once gilded. Near by are large incense-burners in form like the familiar Chinese pagodas, but all of bronze covered with the most beautiful designs. These are gifts of some of China's emperors. Most of the temples have been built through their munificence, and the numerous priests who inhabit the houses which surround them are in receipt of salaries in money and food from the government. The interiors of the temples are most gorgeous. Images of the gods, of all sizes and made of different materials,—gold, silver, bronze, and clay,—smile, frown, or make hideous faces at one from every side, while the altars before them are covered with offerings of fruit, confectionery, and bowls of clear water, the darkness made bright by innumerable little brass lamps filled with butter and arranged in rows along the altar edge. In one temple I saw a number of large cloisonné incense-burners dating from the seventeenth century, exquisite in color and design. In another were stored all the divers implements used in church worship,—drums, conch shells, trumpets (some eight feet long and in shape like the alpine horn),—and on shelves arranged along the walls were copies of the sacred books, in Tibetan and Mongol, written in gold and most wonderfully illuminated. A little lower down the hill, in one of the temples, I was shown a footprint of the Buddha, one foot six inches long and six inches broad.

The priests who live here number about five thousand and are mostly Tibetans and Mongols, and the form of worship is the Lama-

ist or that prevailing in Tibet. There are sixty-five temples or shrines in the valley, and it is said that there used to be three hundred and sixty, so that a man could perform his devotions at a different one nearly every day of the year.

The name of this most sacred place, "Five Table-mountains," is due to there being round about it five high peaks with level tops. The highest one, called the Northern Peak, is 10,050 feet high, and in clear weather one can see the China Sea from it—at least, so it is said; but when I was on it, in the middle of October, I could not see two hundred yards away, on account of the heavy snow which was falling.

The Wu-t'ai shan is visited yearly by tens of thousands of Mongols and by many Tibetans. It is no uncommon sight, when traveling over one of the roads leading there, to see devout Mongols journeying thither on foot and making a full-length prostration every two steps, measuring the whole distance with their bodies. Months are frequently taken in performing this highly meritorious deed, for three or four miles a day when gone over in this fashion are enough to exhaust the strongest man. This reminds me that one day when traveling through Ssu-ch'uan, over the mountains between Ta-chien-lu and Ya-chou, I met a *ho-shang*, a Chinese Buddhist priest, from the famous P'u-t'o shan convent in the Chusan Archipelago, not far from Ning-po. He was on his way to Lh'asa, and was making a prostration every two steps. He had traveled about 1600 miles in four years, making these prostrations all the way. He carried in his hands a little altar on which burned some joss-sticks, and this he placed before him, in the supposed direction of Lh'asa, before making his prostration. He was very cheerful, and told me that he hoped to be able to reach Lh'asa in about two years, as he had only some 1100 miles more to cover. He carried with him certificates from abbots of different temples where he had rested his wearied limbs for a while, attesting the truth of his story and recommending him to the charity of all whom he might meet.

From T'ai-yuan our road led south down the valley of the Fen ho, which drains the greater part of the province and finally empties into the Yellow River near its great and final bend eastward. Everywhere the country was thickly populated, and every available inch of soil was under cultivation. To one who passes quickly through Northern China without paying any special attention to the question the country would not seem so thickly settled, for detached farms are nearly unknown, the people congregating in villages, probably as affording better protection from robbers and not

infrequently from rebels. So one sees broad stretches of country without a habitation, but then towns of 10,000 or 20,000 inhabitants are found every ten or fifteen miles along the road, and similar ones are seen no matter which way one goes. In Ssu-ch'uan only does the density of the population strike one; for there, and as far as I know there alone, do the people live in detached cottages and far from villages.

The largest, though not the most important, town we passed through before reaching the Yellow River was P'ing-yang. Richthofen tells a story of it in his letter on the province of Shan-hsi, which is typical of official customs, and hence worth repeating.

Towards 1869 a band of rebels coming from Ho-nan entered the city quite unexpectedly, but left again after a slight pillage. When they were at some distance the mandarins, in order to give some substance to their projected report to the emperor of having saved the city by martial defense, ordered some shots to be fired after them from the wall. The rebels, considering this an ungrateful treatment, turned back and destroyed the whole city, killing a great many people.

So completely did they destroy the town that it is still in a ruinous condition, and only a small portion of it is inhabited.

In the lower part of the province cotton is very extensively cultivated, and, from what was shown me of it, I believe it to be superior to that raised in Chih-li. Jujube and persimmon trees grow all over the fields, and the former are frequently made into hedgerows. The jujube fruit is, when preserved, a most excellent substitute for dates, and the dried persimmon I prefer to the best figs. Brandied jujubes are also much liked, and from the persimmons a kind of whisky, resembling poor Scotch whisky, connoisseurs say, is distilled.¹

We came to the bank of the Yellow River in front of the great customs station of T'ung-kuan early on the morning of January 5. The river is here between five hundred and six hundred yards wide, a muddy and rather sluggish stream, flowing between high banks of loess, behind which rise to the east ranges of dark, jagged mountains, while to the west and northwest spreads out a vast loess plain, the basin of the river Wei, from of old the granary of China. It is its yellow color, due to the loess, called "yellow earth" by the Chinese, which suggested the use of yellow as the color sacred in China to imperial majesty. This point of the river is called by the Chinese "the head of the Yellow River," for it is near here that

¹ See Rev. Chester Holcombe in "Journal North China Branch Royal Asiatic Society," New Series, Vol. X., p. 64.

it receives its three principal affluents. To the east of this, when the mountain range to which we have referred has been passed and the stream enters the great alluvial plain of Eastern China, it becomes terrible as year after year it breaks through the levees which for miles in uninterrupted lines along its course protect the surrounding country, and carries death to millions of people and destruction to thousands of square miles of fertile land, thus justly meriting the name, given it by the Emperor Tao-Kuang, of "China's Sorrow."

But the Yellow River at T'ung-kuan showed no signs of ever rising much above the level at which I found it, and its depth was inconsiderable, perhaps eight feet, in the main channel. We experienced no difficulty in crossing it in a flat-bottomed skiff, with our mules and carts and some forty or fifty passengers, except for the floating ice which covered the stream and through which the boatmen had to clear a channel.

T'ung-kuan has been from of old a position of great importance, strategically and fiscally speaking: there converge the roads from nearly every part of the empire, from far Turkestan and Tibet, from Yun-nan and Kan-su. Through its walls pass all tribute missions to the court of Peking from the remote dependencies of the empire, from Burmah, from Nepal and Tibet. Here *octroi* dues or *likin* are levied on all merchandise save on that carried by tribute missions, whose members avail themselves of this privilege to do a considerable business: not only is their merchandise allowed to pass through China free of duties, but it is transported for them at government charge.

From T'ung-kuan to Hsi-an, the capital of the province of Shen-hsi, the road lay along the foot of the hills which bound the basin of the Wei to the south. When some sixteen miles from the capital we passed through the town of Lin-t'ung. About a mile to the south, in a hill called Li shan, is said to be buried the famous She Huang-ti, the founder of the Empire of China, the reputed builder of the Great Wall, the destroyer of books and book men. China's Herodotus tells us that "an army of more than seventy thousand laborers was employed in excavating the bowels of the earth at this spot down to 'threefold depth'; and in the heart of the cavern thus formed 'palatial edifices' were constructed, with partitions duly allotted to each rank of the official hierarchy, and these buildings were filled with marvelous inventions and rare treasures of every kind. Artificers were set to work to construct arbalists ready strung, with arrows so set that they would be shot off and would transfix any one who should penetrate within their reach. Riv-

ers, lakes, and seas were imitated by means of quicksilver, caused to flow by mechanism in constant circulation. Above the configuration of the heavens, and below the outline of the countries of the earth, were depicted. Lights were made with the fat of the man-fish with the design of keeping them continually burning. The emperor's son and successor said, 'It behooves not that those of my father's female consorts who have borne no children should go forth into the world'; and he required of them, thereupon, that they should follow the dead emperor to the tomb. The number of those who consequently went to death was very great. When the remains had been placed beneath ground it chanced that some one said, 'The artificers who have made the enginery know all that has been done, and the secret of the treasure will be noised abroad.' When the great ceremony was over, the central gate of the avenue of approach having already been closed, the lower gate was shut, and the artificers came out no more. Trees and hedges were planted over the spot to give it the appearance of an ordinary mountain,"¹ and so it remains to the present day, for not a vestige of all these wonders is to be seen or heard of at Lin-t'ung, whose only present attraction is its hot springs.

The city of Hsi-an was the capital of the empire for centuries. Here it was that She Huang-ti reigned, and from here the emperors of the Han dynasty sent forth their envoys to the Roman Empire. Its imposing walls, second only to those of Peking, its monumental gateways and imperial palace, are even now among the first in China, while the density of its population and the commercial activity which reigns in it show that it is still one of the greatest emporiums of trade in the country.

Among the ancient monuments of Hsi-an of which the people speak with pride is the Forest of Tablets, consisting of stone tablets on which the Confucian classics are engraved, and dating, it is said, from the ninth century of our era. But there stands, a mile or two outside of the western gate of the city, another monument in which foreigners take perhaps more interest, and concerning which much paper has been blackened and the learned world have

heard great argument
About it and about —

It is the Nestorian tablet raised in A. D. 781, containing some rather enigmatical phrases concerning the tenets of a sect of which we know hardly anything, a short history of its

¹ See W. F. Mayers in "Journal North China Branch Royal Asiatic Society," New Series, Vol. XII., p. 14.

MENDICANT TAOIST MONK.

life in China down to the date of the erection of the tablet, and winding up with a number of poor verses mostly containing fulsome compliments to the various emperors who had befriended the teachers of the creed.

I was struck while in Hsi-an with the number of Taoist priests I saw on the streets, while Buddhists were met but rarely. Although both belong to mendicant orders, the former resort to stranger artifices to obtain alms than do the latter. Thus it is no uncommon sight to meet one going about begging with four or

five long iron skewers run through his forearm and little ribbons hanging therefrom. Two I have met had long iron rods running through their cheeks, and they had made oath to remove them only when they had collected a certain sum of money sufficient to repair their temples. The one whose picture is here given had had the iron rod through his face for over four months, living the while on soup and tea only. Another way of raising money is for a priest to take his seat in a little brick sentry-box and let himself be walled in, leaving only

CARD AND CARD-BLOCK OF THE AUTHOR.

a small window through which he can see and can pull a rope by which a big bell is sounded and the attention of passers-by attracted. Here he will sit for months. I have known one to remain in his box for nearly a year without being able to lie down or stand up, but apparently perfectly happy and always ready to have a bit of gossip.

I stopped at Hsi-an only a day and a half, as I was most anxious to reach Lan-chou, and, if possible, Hsi-ning, before the Chinese New Year (January 31). The distance between Hsi-an and the capital of Kan-su is about five hundred miles. The country gradually but steadily rises, the road lying over loess-covered hills and through loess-lined valleys. The population grew thinner as we advanced westward, and the ruins of towns and villages, sad mementos of the late Mohammedan rebellion, became more numerous and more complete. From the moment we entered the province of Kan-su the aspect of the road changed, for from there all the way to the capital rows of willow trees have been planted on both sides of it. It was told me that Tso Tsung-t'ang, late governor-general of Kan-su and the conqueror of Kashgaria, having heard that it was customary in western lands to plant trees along the highways, had the road leading from Hsi-an through Lan-chou and as far as Liang-chou planted with those I saw, and, strangely enough, they have now been growing for years in a country where no other trees are to be seen, all having been cut down long since; but these have not been too badly treated by the people, who have contented themselves with lopping off the lower boughs.

Not very far from the border of Shen-hsi, and

a little to the west of the city of P'ing-chou, we passed the Ta Fo ssu, "the temple of the big Buddha." The valley in which we were traveling is bounded for over six hundred feet on the south side by a bed of sandstone rising vertically for over a hundred feet. In this soft stone a number of cave-temples have been cut, only one of which is now in repair. The temple is entered by a narrow passageway, passing under a high brick structure built against the face of the rock, and in the top of which is a large aperture corresponding to a hole made in the rock by which light enters the temple. The temple is dome shaped; the interior rock has not all been removed, but shaped into a huge statue of the Buddha seated cross-legged. On each side of him is a smaller image of a standing demiurge. The principal figure is about forty-five feet high and richly gilt, as are also the two smaller ones. The work is not of a high order, and cannot compare with what I saw in the cave-temple of Yung-Kan, near Ta-t'ung in Shan-hsi, on a former journey. This latter temple, I feel very sure, was made in the fifth or the sixth century of our era, and it is probable that the Ta Fo ssu was excavated at about the same time.

Kan-su is a sparsely peopled province which has had much to suffer during the late Mohammedan rebellion. Its towns and villages have been pillaged and burned, first by rebels then by the imperial troops, and its people have been killed by myriads; but the spirit of the Mohammedan has not been crushed, and though nearly twenty years have elapsed since the rebellion was quelled, the officials in the western and southwestern parts of the province are in constant dread of a fresh uprising. The people are poor, and they lack that energy and push which is so striking a characteristic of most of their countrymen. The villages through which I passed were mostly composed of miserable mud hovels, not over twelve feet square, a *k'ang*, lighted from the outside, and in which grass or dried manure served as fuel, occupying more than half of the hut. A mud stand with a hole for a fire, kept burning by a box-bellows, and over which is placed a shallow iron pan, the only cooking utensil in the house, is the next most important article of furniture. A small hand-mill or quern, a few earthenware pots, and some bits of dirty felt and cotton complete the *ameublement* of these dens, in which frequently three generations live huddled together. Around the mouth of the *k'ang* lie a few lank pigs trying to get a little warmth from the fire within, while a half-dozen skinny children, clothed only in too-short and much-tattered jackets, gambol about and romp in the mud with some asthmatic chickens and mangy

dogs. The food of this people is *mien* or vermicelli, and cakes of wheat flour called *mo-kui* or *mo-mo*, varying only in size and thickness, but never in their sodden indigestibility. Once in twelve months, at New Year's, the natives, if they are Mohammedans, indulge in meat, pork or mutton, not wisely but too well, for frequently they die from gorging themselves with it. Their only pleasure in life is opium-smoking, and I never had the heart to begrudge it them, for I do not believe that it affects the mass of those who use it as perniciously as has generally been said. Take, for example, the Ssu-ch'uanese: they do work of the heaviest kind, as porters over the rough mountain roads or as boat-trackers up the swift eddying rivers of their province,—work which only strong and healthy men could do,—and nearly every one of them is a confirmed opium-smoker. Nor does opium-smoking dull the mind and produce somnolence; its effects are just the reverse. The brain under its influence becomes more active, there is but little inclination to sleep, and labor of any kind seems to become easier. Its use, however, destroys all taste for food and for any sensual indulgence, hence the emaciated condition of those who have been inveterate smokers for a long time. When, however, the smoker uses the foreign drug, Indian or Persian, the effects are more deleterious and rapid; but as it is not within the reach of the mass of the people on account of its very high price, they smoke only the native *T'u-yen*, with consequences, as I believe, less injurious than what is seen elsewhere resulting from drinking gin or whisky.

When about six miles before reaching Lan-chou we again came on the Yellow River where, issuing out of a deep gorge of granite

rock in which it has worn a narrow channel, it bends northward and flows through a broad level country till it has passed Ning-hsia. Here the stream is clear and swift, some 175 yards wide, and resembled nowise the sluggish, muddy river we had crossed at T'ung-kuan. It only becomes muddy after passing Ning-hsia, where it flows through a sandy waste. The winds which are always blowing there carry great masses of dust into the river; to this silt the three great affluents which empty into it near T'ung-kuan add the loess carried down in their waters. The Yellow River down to Ning-hsia is navigated on rafts made of inflated ox-hides, and in this way large quantities of goods are brought down country at a nominal cost, the skins composing the rafts being readily disposed of.

Lan-chou is situated on the right bank of the Yellow River and has a population of from 70,000 to 80,000, a large percentage of whom are Mohammedans. There is a bridge of boats across the river; but in winter this is removed, and the ice is usually sufficiently strong for carts to cross over. The city offers little of interest for the sightseer, and the only important industry is the manufacture of water-pipe tobacco, the annual sale of which amounts to about six hundred thousand dollars. Some years ago the governor-general established a factory outside the city for the manufacture of woolen goods, and several foreigners were employed in it; but, like most foreign-

ROSARY BEADS CUT TO REPRESENT THE EIGHTEEN LO-HAN (ARHATS).

equipped industries in Chinese hands, it proved abortive, and to-day the factory is used as a small-arms repair shop and governmental godown, its high brick chimney a landmark seen for miles away.

At Lan-chou my cart journey was at an end.

mountains to the east of it gold washing is extensively carried on, although the profit derived therefrom seems to be very small. It is a common saying among the people that when a man has tried in vain to make a livelihood by all conceivable methods he finally takes to washing gold.

THE TALE'LAMA OF LH'ASA. TSONGK'APA, BORN AT KUMBUM. PAN-CH'EN RINPOCH'E' OF TRASHIL'UNPO.
THE INCARNATE GODS OF TIBET. (FROM A TIBETAN PAINTING.)

I hired three mules to carry my luggage, and having bought a pony for myself to ride, I left the city after a sojourn of ten days, during which I enjoyed the hospitality of Father de Meester of the Belgian Catholic Mission. I would like to speak here of the work of this mission in Mongolia, Kan-su, and Turkestan, and of the lives and privations of these devoted men, but I must hurry on.

We followed up the course of the Yellow River for a day and a half, and then, crossing the stream on a small ferryboat, entered the valley of the Hsi-ning River, up which we journeyed for four days more, passing only one town on the way, the prefectural city of Nien-pei. In the

When some ten miles from Hsi-ning we crossed a wooden bridge to the right bank of the river, after which our road led through a narrow gorge in a range of granitic and schistose rocks which cuts the valley at right angles. The road here presented no more difficulty than is usually met with in such gorges, in fact not nearly so much as in those near Lao-ya-p'u. But listen to what Abbé Huc says of it in his charming "Souvenirs of a Journey in Tartary and Tibet."

A day before reaching Si Ning we traveled over a most difficult and dangerous piece of road, where we often had to recommend ourselves to the protection of Divine Providence. We went amidst great

boulders and beside a deep torrent where seething waters leaped at our feet. The abyss yawned beneath us and a slip would have sufficed to precipitate us into it. But chiefly did we tremble for our camels, so awkward and so heavy when walking in dangerous places. But in the end, thanks to God's bounty, we reached Si Ning without accident.

A clear case of distance lending enchantment to the view; for not only is the gorge a short one, but there is absolutely no danger in it, and the most awkward camel in the world could go through it on a run.

We reached Hsi-ning Fu on the afternoon of February 6, and took up our quarters in a large inn in the suburbs; but we had hardly alighted when I was requested by the police to report to the authorities, show my passport, and tell them my plans, none of which did I in the least care to do. So at daylight next morning, having shaved my head and

face and changed my Chinese gown for a big red cloth one like that worn by Mongols and Tibetans, and having made a few minor alterations in my dress, I left Hsi-ning with a party of K'alk'a Mongols with whom I had traveled for the last few days, and went to the famous lamasery of Kumbum, called by the Chinese T'ar-ssu, about twenty miles away, where there were no bothersome officials asking embarrassing questions and prying into one's affairs.

The road thither was crowded with pilgrims, Mongols, Tibetans, and Sifans, all hurrying to witness the feast of the 15th of the first moon and the display of wonderful butter bas-reliefs, when the temple and the adjacent villages are filled with people from all the country round and from far-off Tibet, from Lh'asa, Trashil'unpo, and K'amdo, from Eastern Mongolia and from Turkestan.

W. Woodville Rockhill.

TWO FRENCH SCULPTORS.¹

RODIN — DALOU.

SIDE by side with the academic current in French art has moved of recent years a naturalist and romantic impulse whose manifestations have been always vigorous though occasionally exaggerated. In any of the great departments of activity nationally pursued—as art has been pursued in France since Francis I.—there are always these rival currents of which now one and now the other constantly affects the ebb and flow of the tide of thought and feeling. The classic and romantic duel of 1830, the rise of the naturalist opposition to Hugo and romanticism in our own day, are familiar instances of this phenomenon in literature. The revolt of Géricault and Delacroix against David and Ingres are equally well known in the field of painting. Of recent years the foundation of the periodical “*L'Art*” and its rivalry with the conservative “*Gazette des Beaux Arts*” mark with the same definiteness, and an articulate precision, the same conflict between truth, as new eyes see it, and tradition. Never, perhaps, since the early Renaissance, however, has nature asserted her supremacy over convention in such un-

mistakable, such insistent, and, one may say, I think, such intolerant fashion as she is doing at the present moment. Sculpture, in virtue of the defiant palpability of its material, is the most impalpable of the plastic arts, and therefore it feels less quickly than the rest, perhaps, the impress of the influences of the epoch and their classifying canons. Natural imitation shows first in sculpture and subsists in it longest. But convention once its conqueror the return to nature is here most tardy, because, owing to the impalpable, the elusive quality of sculpture, though natural standards may everywhere else be in vogue, no one thinks of applying them to so specialized an expression. Its variation depends therefore more completely on the individual artist himself. Niccolò Pisano, for example, died when Giotto was two years old, but, at the other end of the historic line of modern art, it has taken years since Delacroix to furnish recognition for Auguste Rodin. The stronghold of the Institute had been mined many times by revolutionary painters before Dalou took the grand medal of the Salon.

Owing to the relative and in fact polemic position which these two artists occupy the movement which they represent, and of which as yet they themselves form a chief part, a little obscures their respective personalities, which are nevertheless, in sculpture, by far the most positive and puissant of the present epoch. M.

¹ To explain the absence of reference to some of Rodin's latest work it should be said that this article was written some years ago, and has been delayed on account of the preparation of suitable illustrations.—EDITOR.

MME. MORLA—PORTRAIT BUST IN MARBLE BY RODIN. (LUXEMBOURG GALLERY.)

Rodin's work especially is so novel that one's first impression in its presence is of the implied criticism of the Institute. One thinks first of its attitude; its point of view, its end, aim, and means, and of the utter contrast of these with those of the accepted contemporary masters in his art—of Dubois and Chapu, Mercié and Saint-Marceaux. One judges generally, and instinctively avoids personal and direct

impressions. The first thought is not, Is the "Saint Jean" a successful work of art? But, *Can* it be successful if the accepted masterpieces of modern sculpture are not to be set down as insipid? One is a little bewildered. It is easy to see and to estimate the admirable traits and the shortcomings of M. Dubois's delightful and impressive reminiscences of the Renaissance, of M. Mercié's refined and grace-

PAINTED BY A. LEGROS.

AUGUSTE RODIN.

ful compositions. They are of their time and place. They embody, in distinguished manner and in an accentuated degree, the general inspiration. Their spiritual characteristics are traditional and universal, and technically, without perhaps often passing beyond it, they exhaust cleverness. You may enjoy or resent their classic and exemplary excellences, as you feel your taste to have suffered from the lack or the superabundance of academic influences; I cannot fancy an American insensitive to their charm. But it is plain that their perfection is a very different thing from the characteristics of a strenuous artistic personality seeking expression. If these latter when encountered are evidently seen to be of an extremely high order, contemporary criticism, at all events, should feel at once the wisdom of beginning with the endeavor to appreciate,

instead of, as is generally the case, "lightly running amuck at an august thing." French esthetic authority which did this in the instances of Barye, of Delacroix, of Millet, of Manet, of Puvis de Chavannes, did it also for many years in the instance of M. Rodin. It owes its defeat in the contest with him—for like the recalcitrants in the other contests, M. Rodin has definitively triumphed—to the unwise attempt to define him in terms heretofore applicable enough to sculptors but wholly inapplicable to him. It failed to see that the thing to define in his work was the man himself, his temperament, his genius. Taken by themselves and considered as characteristics of the Institute sculptors the obvious traits of this work might, that is to say, be adjudged eccentric and empty. Fancy Professor Guillaume suddenly subordinating academic

H. ART. ENTON. AFTER PHOTOGRAPH.

JEAN PAUL LAURENS—PORTRAIT BUST IN MARBLE BY RODIN.

disposition of line and mass to true structural expression! One would simply feel the loss of his accustomed style and harmony. With M. Rodin, who deals with nature directly, through the immediate force of his own powerful temperament, to feel the absence of the Institute training and traditions is absurd. The question in his case is simply whether or no he is a great artistic personality, an extraordinary and powerful temperament, or whether he is merely a tur-

bulent and capricious protestant against the measure and taste of the Institute. But this is really no longer a question, however it may have been a few years ago; and when his Dante portal for the new Palais des Arts Décoratifs shall have been finished and the public had an opportunity to see what the sculptor's friend and only serious rival, M. Dalou, calls one of if not the most original and astonishing pieces of sculpture of the nineteenth century, it will be

recognized that M. Rodin, so far from being amenable to the current canon, has brought the canon itself to judgment.

How and why, people will perceive in proportion to their receptivity. Candor and intelligence will suffice to appreciate that the secret of M. Rodin's art is structural expression, and that it is this and not any superficial eccentricity of execution that definitely distinguishes him from the Institute. Just as his imagination, his temperament, his spiritual energy and ardor individualize the positive originality of his motive, so the expressiveness of his treatment sets him aside from all as well as from each of the Institute sculptors in what may be broadly called technical attitude. No sculptor has ever carried expression further. The sculpture of the present day has certainly not occupied itself much with it. The Institute is perhaps a little afraid of it. It abhors the *baroque* rightly enough, but very likely it fails to see that the expression of such sculpture as M. Rodin's no more resembles the contortions of the Dresden Museum giants than it does the composure of M. Delaplanche. The *baroque* is only violent instead of placid commonplace, and is as conventional as any professor of sculpture could desire. Expression means individual character completely exhibited rather than conventionally suggested. It is certainly not too much to say that in the sculpture of the present day the sense of individual character is conveyed mainly by convention. The physiognomy has usurped the place of the physique, the gesture of the form, the pose of the substance. And face, gesture, form are, when they are not brutally naturalistic and so not art at all, not individual and native, but typical and classic. Very much of the best modern sculpture might really have been treated like the figures of Tanagra, of which the

WHITT EATON 1890. AFTER PHOTOGRAPH FROM RODIN

STATUE BY RODIN — "THE AGE OF BRONZE."

bodies were made by wholesale, being supplied with individual heads when the time came for using them.

This has been measurably true since the disappearance of the classic dress and the concealment of the body by modern costume. The nudes of the early Renaissance in painting, still more than in sculpture, are differentiated by the faces. The rest of the figure is generally conventionalized as thoroughly as the face itself is in Byzantine and the hands in Giottoesque painting. Giotto could draw admirably, it need not be said. He did draw as well as the contemporary feeling for the human figure demanded. When the Renaissance reached its climax and the study of the antique led artists to look beneath drapery and interest themselves in the form, expression made an immense step forward. Color was indeed almost lost sight of in the new interest, not to reappear till the Venetians. But owing to the lack of visible nudity, to the lack of the classic gymnasias, to the concealments of modern attire, the knowledge of and interest in the form remained, within certain limits, an esoteric affair. The general feeling, even where, as in the Italy of the *quattro* and *cinque* *centi*, every one was a connoisseur, did not hold the artist to expression in his anatomy as the general Greek feeling did. Every one was a connoisseur of art alone, not of nature as well. Consequently, in spite of such an enthusiastic genius as Donatello, who probably more than any other modern has most nearly approached the Greeks,—not in spiritual attitude, for he was eminently of his time, but in his attitude towards nature,—the human form in art has for the most part remained, not conventionalized as in the Byzantine and Gothic times, but thoroughly conventional. Michael Angelo himself certainly may be charged with lending the immense weight of his majestic genius to perpetuate the conventional. It is not his distortion of nature, as pre-Raphaelite limitedness glibly asserts, but his carelessness of her prodigious potentialities that marks one side of his colossal accomplishment. Just as Mr. Eidlitz will protest that Michael Angelo's architecture was meretricious, however inspiring, so M. Rodin declares his sculpture unsatisfactory, however poetically impressive. "He used to do a little anatomy evenings," he said to me, "and used his chisel next day without a model. He repeats endlessly his one type—the youth of the Sistine ceiling. Any particular felicity of expression you are apt to find him borrowing from Donatello—such as, for instance, the movement of the arm of the 'David,' which is borrowed from Donatello's 'St. John Baptist.'" Most people to whom Michael Angelo's creations appear

celestial in their majesty at once and in their winningness would scout this. But it is worth citing both because M. Rodin strikes so many crude apprehensions as a French Michael Angelo, whereas he is so radically removed from him in point of view and in practice that the unquestionable spiritual analogy between them is rather like that between kindred spirits working in different arts, and because, also, it shows not only what M. Rodin is not, but what he is. The grandiose does not run away with him. His imagination is occupied largely in following out nature's suggestions. His sentiment does not so drench and saturate his work as to float it bodily out of the realm of natural into that of supernal beauty, there to crystallize in decorative and puissant visions appearing out of the void and only superficially related to their corresponding natural forms. Standing before the Medicean tombs the modern susceptibility receives perhaps the most poignant, one may almost say the most intolerable, impression to be obtained from any plastic work by the hand of man; but it is a totally different impression from that left by the sculptures of the Parthenon pediments, not only because the sentiment is wholly different, but because in the great Florentine's work it is so overwhelming as wholly to dominate purely natural expression, natural character, natural beauty. In the Medici Chapel the soul is exalted; in the British Museum the mind is enraptured. The object itself seems to disappear in the one case, and to reveal itself in the other.

I do not mean to compare M. Rodin with the Greeks—from whom in sentiment and imagination he is, of course, as totally removed as what is intensely modern must be from the antique—any more than I mean to contrast him with Michael Angelo, except for the purposes of clearer understanding of his general esthetic attitude. Association of anything contemporary with what is classic, and especially with what is greatest in the classic, is always a perilous proceeding. Very little time is apt to play havoc with such classification. I mean only to indicate that the resemblance to Michael Angelo found by so many persons in such works as the Dante door is only of the loosest kind,—as one might, through their common lusciousness, compare peaches with pomegranates,—and that to the discerning eye, or the eye at all experienced in observing sculpture, M. Rodin's sculpture is far more closely related to that of Donatello and the Greeks. It, too, reveals rather than constructs beauty, and by the expression of character rather than by the suggestion of sentiment.

An illustration of M. Rodin's affinity with the antique is an incident which he related to

A GROUP FROM THE "BOURGEOIS DE CALAIS," BY RODIN.

ENGRAVED BY A. LEVILLÉ.

me of his work upon his superb "Age d'Airain." He was in Naples; he saw nature in freer inadvertence than she allows elsewhere; he had the best of models. Under these favoring circumstances he spent three months on a leg of his statue; "which is equivalent to saying that I had at last absolutely mastered it," said he. One day in the Museo Nazionale he noticed in an antique the result of all his study and research. Nature, in other words, is M. Rodin's *material* in the same special sense in which it was the antique material, and in which, since Michael Angelo and the high Renaissance, it has been for the most part only the sculptor's *means*. It need not be said that the personality of the artist may be as strenuous in the one case as in the other; unless, indeed, we maintain, as perhaps we may, that individuality is more apt to atrophy in the latter instance, for as one gets farther and farther away from nature he is in more danger from conventionality than from caprice. And this is in fact what has happened since the high Renaissance, the long line of conventionalities being continued, sometimes punctuated here and there as by Clodion or Caffieri, Houdon, David, Rude, or Barye, sometimes rising into great dignity and refinement of style and intelligence as in the contemporary sculpture of the Institute, but in general almost purely decorative or sentimental, and, so far as natural expression is concerned, confining itself to psychological rather than physical character.

What is it, for instance, that distinguishes a group like M. Dubois's "Charity" from the *genre* sentiment or incident of some German or Italian "professor"? Qualities of style, of refined taste, of elegance, of true intelligence. Its artistic interest is purely decorative and sentimental. Really what its average admirer sees in it is the same moral appeal which delights the simple admirers of German or Italian treatment of a similar theme. It is simply infinitely higher bred. Its character is developed no further. Its significance as form is not insisted on. The parts are not impressively differentiated, and their mysterious mutual relations and correspondences are not dwelt on. The physical character, with its beauties, its salient traits of every kind, appealing so strongly to the sculptor to whom nature appears plastic as well as suggestive, is wholly neglected in favor of the psychological suggestion. And the individual character, the *cachet* of the whole, the artistic essence and *ensemble*, that is to say, M. Dubois has, after the manner of most modern sculpture, conveyed in a language of convention, which since the time of the Siense fountain, at all events, has been classical. The literary

artist does not proceed in this way. He does not content himself with telling us, for example, that one of his characters is a good man or a bad man, an able, a selfish, a tall, a blonde, or a stupid man, as the case may be. He takes every means to express his character, and to do it, according to M. Taine's definition of a work of art, more completely than it appears in nature. He recognizes its complexity and enforces the sense of reality by a thousand expedients of what one may almost call contrasting masses, derivative movements, and balancing planes. He distinguishes every possible detail that plays any structural part, and in short, instead of giving us the mere symbol of the Sunday-school books, shows us a concrete organism at once characteristic and complex. Judged with this strictness, which in literary art is elementary, how much of the best modern sculpture is abstract, symbolic, purely typical. What insipid fragments most of the really eminent Institute statues would make were their heads knocked off by some band of modern barbarian invaders. In the event of such an irruption would there be any torsos left from which future Poussins could learn all they should know of the human form? Would there be any *dissecta membra* from which skilled anatomists could reconstruct the lost *ensemble*, or at any rate make a shrewd guess at it? Would anything survive mutilation with the serene confidence in its fragmentary but everywhere penetrating interest which seems to pervade the most fractured fraction of a Greek relief on the Athenian acropolis? Yes, there would be the debris of Auguste Rodin's sculpture.

In our day the human figure has never been so well understood. Back of such expressive modeling as we note in the "Saint Jean," in the "Adam" and "Eve," in a dozen figures of the Dante door, is a knowledge of anatomy such as even in the purely scientific profession of surgery can proceed only from an immense fondness for nature, an insatiable curiosity as to her secrets, an inexhaustible delight in her manifestations. From the point of view of such knowledge and such handling of it, it is no wonder that the representations of nature which issue from the Institute seem superficial. One can understand that from this point of view very delightful sculpture, very refined, very graceful, very perfectly understood within its limits, may appear like *baudruche* — inflated gold-beater's skin, that is to say, of which toy animals are made in France, and which has thus passed into studio *argot* as the figure for whatever lacks structure and substance. Ask M. Rodin the explanation of a movement, an attitude, in one of his works which strikes your

A. LEGROS—BRONZE BUST BY RODIN.

convention-steeped sense as strange, and he will account for it just as an anatomical demonstrator would — pointing out its necessary derivation from some disposition of another part of the figure, and not at all dwelling on its grace or its other purely decorative felicity. Its artistic function in his eyes is to aid in expressing fully and completely the whole of

which it forms a part, not to constitute an harmonious detail merely agreeable to the easily satisfied eye. But then the whole will look anatomical rather than artistic. There is the point exactly. Will it? I remember speculating about this in conversation with M. Rodin himself. "Is n't there danger," I said, "of getting too fond of nature, of dissecting with so much

enthusiasm that the pleasure of discovery may obscure one's feeling for pure beauty, of losing the artistic in the purely scientific interest, of becoming pedantic, of imitating rather than constructing, of missing art in avoiding the artificial?" I had some difficulty in making myself understood; this perpetual see-saw of nature and art which enshrouds esthetic dialectics as in a Scotch mist seems curiously factitious to the truly imaginative mind. But I shall always remember his reply, when he finally made me out, as one of the finest severings conceivable of a Gordian knot of this kind. "Oh, yes," said he; "there is, no doubt, such a danger—for a mediocre artist."

M. Rodin is, whatever one may think of him, certainly not a mediocre artist. The instinct of self-preservation may incline the Institute to assert that he obtrudes his anatomy. But prejudice itself can blind no one of intelligence to his immense imaginative power, to his poetic "possession." His work precisely illustrates what I take to have been at the best epochs the relations of nature to such art as is loosely to be called imitative art—what assuredly were those relations in the mind of the Greek artist. Nature supplies the parts and suggests their cardinal relations. Insuffi-

expressing character as well as of suggesting sentiment. Very beautiful works are produced without her aid to this extent. We may be sure of this without asking M. Rodin to admit it. He would not do his own work so well were he prepared to; as Millet pointed out when asked to write a criticism of some other painter's canvas, in estimating the production of his fellows an artist is inevitably handicapped by the feeling that he would have done it very differently himself. It is easy not to share M. Rodin's gloomy vaticinations as to French sculpture based on the continued triumph of the Institute style and suavity. The Institute sculpture is too good for any one not himself engaged in the struggle to avoid being impressed chiefly by its qualities to the neglect of its defects. At the same time it is clear that no art can long survive in undiminished vigor that does not from time to time renew its vitality by resteeping itself in the influences of nature. And so M. Rodin's service to French sculpture becomes at the present moment especially signal and salutary because French sculpture, however refined and delightful, shows just now very plainly the tendency towards the conventional which has always proved so dangerous, and because M. Rodin's

work is a conspicuous, a shining example of the return to nature on the part not of a mere realist, naturalist, or other variety of "mediocre artist," but of a profoundly poetic and imaginative temperament.

This is why, one immediately perceives in studying his works, Rodin's

SKETCH OF THE MIRABEAU RELIEF IN BRONZE BY DALOU.

cient study of her leaves these superficial and insipid. Inartistic absorption in her leaves them lifeless. The imagination which has itself conceived the whole, the idea, fuses them in its own heat into a new creation which is "imitative" only in the sense that its elements are not inventions. The art of sculpture has retraced its steps far enough to make pure invention, as of Gothic griffins and Romanesque symbology, unsatisfactory to every one. But save in M. Rodin's sculpture it has not fully renewed the old alliance with nature on the old terms—Donatello's terms; the terms which exact the most tribute from nature, which insist on her according her completest significance, her closest secrets, her faculty of

treatment, while exhausting every contributory detail to the end of complete expression, is never permitted to fritter away its energy either in the mystifications of optical illusion or in the infantine idealization of what is essentially subordinate and ancillary. This is why he devotes three months to the study of a leg, for example—not to copy, but to "possess" it. Indeed no sculptor of our time has made such a sincere, and in general successful, effort to sink the sense of the material in the conception, the actual object in the artistic idea. One loses all sense of bronze or marble, as the case may be, not only because the artistic significance is so overmastering that one is exclusively occupied in apprehending it, but because there are none of those super-

THE MARQUIS DE BRÉZÉ AND MIRABEAU. (FROM THE RELIEF.)

ficial graces, those felicities of surface modeling, which, however they may delight, infallibly distract as well. Such excellences have assuredly their place. When the motive is conventional or otherwise insipid, or even when its character is distinctly light without being trivial, they are legitimately enough agreeable. And because in our day sculptural motives have generally been of this order we have become accustomed to look for such excellences, and, very justly, to miss them when they are

absent. Grace of pose, suavity of outline, pleasing disposition of mass, smooth, round deltoids and osseous articulations, the perpetually changing planes of flesh and free play of muscular movement, are excellences which in the best of academic French sculpture are sensuously delightful in a high degree. But they invariably rivet our attention on the successful way in which the sculptor has used his bronze or marble to decorative ends, and when they are accentuated so as to dominate the

idea they invariably enfeeble its expression. With M. Rodin one does not think of his material at all; one does not reflect whether he used it well or ill, caused it to lose weight and immobility to the eye or not, because all his superficial modeling appears as an inevitable deduction from the way in which he has

of the idea, really emphasizes itself unduly because of its imperfect and undeveloped character. Detail which is neglected really acquires a greater prominence than detail which is carried too far, because it is sensuously disagreeable. But when an artist like M. Rodin conceives his spiritual subject so largely and

PORTION OF THE BAS-RELIEF "THE REPUBLIC," BY DALOU.

conceived his larger subject, and not as "handling" at all. In reality of course it is the acme of sensitive handling. The point is a nice one. His practice is a dangerous one. It would be fatal to a less strenuous temperament. To leave, in a manner and so far as obvious insistence on it goes, "handling" to take care of itself is to incur the peril of careless, clumsy, and even brutal modeling, which, so far from dissembling its existence behind the prominence

with so much intensity that mere sensuous agreeableness seems too insignificant to him even to be treated with contempt, he treats his detail solely with reference to its centripetal and organic value, which immediately becomes immensely enhanced, and the detail itself, dropping thus into its proper place, takes on a beauty wholly transcending the ordinary agreeable aspect of sculptural detail. And the *ensemble* of course is in this way en-

forced as it can be in no other, and we get an idea of Victor Hugo or St. John Baptist so powerfully and yet so subtly suggested that the abstraction seems actually all that we see in looking at the concrete bust or statue. Objections to M. Rodin's "handling" as eccentric or capricious appear to the sympathetic beholder of one of his majestic works the very acme of misappreciation, and their real excuse — which is, as I have said, the fact that such "handling" is as unfamiliar as the motives it accompanies — singularly poor and feeble.

As for the common nature of these motives, the character of the personality which appears in their varied presentments, it is almost idle to speak in the absence of the work itself, so eloquent is this at once and so untranslatable. But it may be said approximately that M. Rodin's temperament is in the first place deeply romantic. Everything the Institute likes repels him. He has the poetic conception of art and its mission, and in poetry any authoritative and codifying consensus seems to him paradoxical. Style, in his view, unless it is something wholly uncharacterizable, is a vague and impalpable spirit breathing through the work of some strongly marked individuality, or else it is formalism. He delights in the fantasticality of the Gothic. The west façade of Rouen inspires him more than all the formulæ of Palladian proportions. He detests systematization. He reads Shakspeare, Schiller, Dante almost exclusively. He sees visions and dreams dreams. The awful in the natural forces, moral and material, seems his element. He believes in freedom, in the absolute emancipation of every faculty. As for study, study nature. If then you fail in restraint and measure you are a "mediocre artist," whom no artificial system devised to secure measure and restraint could have rescued from essential insignificance. No poet or landscape painter ever delighted more in the infinitely varied suggestiveness and exuberance of nature, or ever felt the formality of much that passes for art as more chill and drear. Hence in all his works we have the sense first of all of an overmastering sincerity; then of a prodigious wealth of fancy; then of a marvelous acquaintance with his material. His imagination has all the vivacity and tumultuousness of Rubens's, but its images, if not better understood, which would perhaps be impossible, are more compact and their evolution more orderly. And they are furthermore one and all vivified by a wholly remarkable feeling for beauty. In spite of all his knowledge of the external world no artist of our time is more completely mastered by sentiment. In the very circumstance of being free from such conventions as the cameo relief, the picturesque costume details, the goldsmith's work

characteristics of the Renaissance, now so much in vogue, M. Rodin's things acquire a certain largeness and loftiness as well as simplicity and sincerity of sentiment. The same model posed for the "Saint Jean" that posed for a dozen things turned out of the academic studios, but compared with the result in the latter cases that in the former is even more remarkable for sentiment than for its structural sapience and general physical interest. How perfectly insignificant beside its moral impressiveness are the graceful works whose sentiment does not result from the expression of the form but is conveyed in some convention of pose, of gesture, of physiognomy! It is like the contrast between a great and a graceful actor. The one interests you by his intelligent mastery of convention, by the tact and taste

KEY TO THE BAS-RELIEF "THE REPUBLIC," BY DALOU.

with which he employs in voice, carriage, facial expression, gesture, diction, the several conventions according to which ideas and emotions are habitually conveyed to your comprehension. Salvini, Coquelin, Got, pass immediately outside the realm of conventions. Their language, their medium of communication, is as new as what it expresses. They are inventive as well as intelligent. Their effect is prodigiously heightened because in this way, the warp as well as the woof of their art being expressive and original, the artistic result is greatly fortified. Given the same model, M. Rodin's result is in like manner expressively and originally enforced far beyond the result towards which the present French school employs the labels of the Renaissance, as conventionally as its predecessor at the beginning of the century employed those of the antique.

"Formerly we used to do Greek," says M. Rodin with no small justice, "now we do Italian. That is all the difference there is." And I cannot better conclude this imperfect notice of the work of a great master, in characterizing which such epithets as majestic, Miltonic, grandiose suggest themselves first of all, than by calling attention to the range which it covers, and to the fact that even into the domain which one would have called consecrate to the imitators of the antique and the Renaissance, M. Rodin's informing sentiment and sense of beauty penetrate with their habitual distinction; and that the little child's head entitled "Alsace" and a small ideal female figure, which the manufacturer might covet for reproduction, but which, as M. Bastien-Lepage said to me, is "a definition of the essence of art," are really as noble as his more majestic works are beautiful.

M. DALOU is the only other sculptor of acknowledged eminence who ranges himself with M. Rodin in his opposition to the Institute. Perhaps his protestantism has been less pronounced than M. Rodin's. It was certainly long more successful in winning both the connoisseur and the public. The state itself, which is now and then even more conservative than the Institute, has charged him with important works, and the Salon has given him its highest medal. And he was thus recognized long before M. Rodin's works had risen out of the turmoil of critical contention to their present envied if not cordially approved eminence. But for being less energetic, less absorbed, less intense than M. Rodin's, M. Dalou's enthusiasm for nature involves a scarcely less uncompromising dislike of convention. He had no success at the *École des Beaux Arts*. Unlike Rodin, he entered those precincts and worked long within them, but never sympathetically or felicitously. The rigor of academic precept was from the first excessively distasteful to his essentially and eminently romantic nature. He chafed incessantly. The training doubtless stood him in good stead when he found himself driven by hard necessity into commercial sculpture, into that class of work which is on a very high plane for its kind in Paris, but for which the manufacturer rather than the designer receives the credit. But he probably felt no gratitude to it for this, persuaded that but for its despotic prevalence there would have been a clearer field for his spontaneous and agreeable effort to win distinction in. He greatly preferred at this time the artistic anarchy of England, whither he betook himself after the Commune — not altogether upon compulsion, but by prudence perhaps, for like Rodin his birth, his training, his disposition, his ideas, have always been

as liberal and popular in politics as in art, and in France a man of any sincerity and dignity of character has profound political convictions even though his profession be purely esthetic. In England he was very successful both at the Academy and with the amateurs of the aristocracy, of many of whom he made portraits, besides finding ready purchasers among them for his imaginative works. The list of these latter begins, if we except some delightful decoration for one of the Champs Elysées palaces, with a statue called "*La Brodeuse*," which won for him a medal at the Salon of 1870. Since then his production has been prodigious in view of its originality, of its lack of the powerful momentum extraneously supplied to the productive force which follows convention and keeps in the beaten track.

His numerous peasant subjects at one time led to comparison of him with Millet, but the likeness is of the most superficial kind. There is no spiritual kinship between the two whatever. Dalou models the Marquis de Brézé with as much zest as he does his "*Boulonnaise allaitant son Enfant*"; his touch is as sympathetic in his Rubens-like "*Silenus*" as in his naturalistic "*Berceuse*." Furthermore there is absolutely no note of melancholy in his realism. His vivacity excludes the pathetic. Traces of Carpeaux's influence are plain in his way of conceiving such subjects as Carpeaux would have handled. No one could have come so closely in contact with that vigorous individuality without in some degree undergoing its impress, without learning to look for the alert and elegant aspects of his model, whatever it might be. But with Carpeaux's distinction Dalou has more poise. He is considerably farther away from the rococo. His ideal is equally to be summarized in the word *Life*, but he cares more for its essence, so to speak, than for its phenomena, or at all events manages to make it felt rather than seen. One perceives that humanity interests him on the moral side, that he is interested in its significance as well as its form. Accordingly with him the movement illustrates the form, which is in its turn truly expressive, whereas occasionally, so bitter was his disgust with the pedantry of the schools, with Carpeaux the form is used to exhibit movement. Then too M. Dalou has a certain nobility which Carpeaux's virile and vigorous vivacity is a shade too animated to reach. Motive and treatment blend in a larger sweep. The graver substance follows the planes and lines of a statelier if less brilliant style. It *has*, in a word, more style. I can find no exacter epithet, on the whole, for Dalou's large distinction, and conscious yet sober freedom, than the word Venetian. There is some subtle phrenotype that associates him with the great

colorists. His work is, in fact, full of color, if one may trench on the jargon of the studios. It has the sumptuousness of Titian and Paul Veronese. Its motives are cast in the same ample mold. Many of his figures breathe the same air of high-born ease and well-being, of serene and not too intellectual composure. There is an aristocratic tincture even in his peasants — a kind of native distinction inseparable from his touch. And in his women there is a certain gracious sweetness, a certain exquisite and elusive refinement elsewhere caught only by Tintoretto, but illustrated by Tintoretto with such penetrating intensity as to leave perhaps the most nearly indelible impression that the sensitive amateur carries away with him from Venice. The female figures in the colossal group which should have been placed in the Place de la République, but was relegated by official stupidity to the Place des Nations, are examples of this patrician charm in carriage, in form, in feature, in expression. They have not the witchery, the touch of Bohemian sprightliness that make such figures as Carpeaux's "Flora" so enchanting, but they are at once sweeter and more distinguished. The sense for the exquisite which this betrays excludes all dross from M. Dalou's rich magnificence. Even the "Silenus" group illustrates exuberance without excess: I spoke of it just now as Rubens-like, but it is so only because it recalls Rubens's superb strength and riotous fancy; it is in reality a Rubens-like motive purged in the execution of all Flemish grossness. There is even in Dalou's fantasticality of this sort a measure and distinction which temper animation into resemblance to such delicate blitheness as is illustrated by the Bargello "Bacchus" of Jacopo Sansovino. Sansovino afterwards, by the way, amid the artificiality of Venice, whither he went, wholly lost his individual force, as M. Dalou, owing to his love of nature, is less likely to do. But his sketch for a monument to Victor Hugo points warningly in this direction, and it would perhaps be easier than he supposes to permit his extraordinary decorative facility to lead him on to execute works unpenetrated by personal feeling, and recalling less the acme of the Renaissance than the period just afterwards when original effort had exhausted itself and the movement of art was due mainly to momentum — when, as in France at the present moment, the enormous mass of artistic production really forced pedantry upon culture, and prevented any but the most strenuous personalities from being genuine because of the immensely increased authoritative of what had become classic.

Certainly M. Dalou is far more nearly in the current of contemporary art than his friend Rodin, who stands with his master

Barye rather defiantly apart from the regular evolution of French sculpture, whereas one can easily trace the derivation of M. Dalou and his relations to the present and the immediate past of his art in his country. His work certainly has its Fragonard, its Clodion, its Carpeaux side. Like every temperament which is strongly attracted by the decorative as well as the significant and the expressive, pure style in and for itself has its fascinations, its temptations for him. Of course it does not succeed in getting the complete possession of him that it has of the Institute. And there is, as I have suggested, an important difference, disclosed in the fact that M. Dalou uses his faculty for style in a personal rather than in the conventional way. His decoration is distinctly Dalou, and not arrangements after classic formulæ. It is full of zest, of ardor, of audacity. So that if his work has what one may call its national side it is because the author's temperament is thoroughly national at bottom, and not because this temperament is feeble or has been academically repressed. But the manifest fitness with which it takes its place in the category of French sculpture shows the moral difference between it and the work of M. Rodin. Morally speaking, it is mainly — not altogether, but mainly — rhetorical, whereas M. Rodin's is distinctly poetic. It is delightful rhetoric and it has many poetic strains — such as the charm of penetrating distinction I have mentioned. But with the passions in their simplest and last analysis he hardly occupies himself at all. Such a work as "La République," the magnificent bas-relief of the Hôtel de Ville in Paris, is a triumph of allegorical rhetoric, very noble, not a little moving, prodigious in its wealth of imaginative material, composed from the center and not arranged with artificial felicity, full of suggestiveness, full of power, abounding in definite sculptural qualities, both moral and technical; it again is Rubens-like in its exuberance but of firmer texture, more closely condensed. But anything approaching the *kind* of impressiveness of the Dante door it certainly does not essay. It is in quite a different sphere. Its exaltation is, if not deliberate, admirably self-possessed. To find it theatrical would be simply a mark of our absurd Anglo-Saxon preference for reserve and repression in circumstances naturally suggesting expansion and elation — a preference surely born of timorousness and essentially very subtly theatrical itself. It is simply, not deeply, intensely poetic, but rather a splendid piece of rhetoric, as I say.

So, too, is the famous Mirabeau relief, which is perhaps M. Dalou's masterpiece, and which represents his national side as completely as the group for the Place des Nations does those

of his qualities I have endeavored to indicate by calling them Venetian. Observe the rare fidelity which has contributed its weight of sincerity to this admirable relief. Every prominent head of the many members of the Assembly, who nevertheless rally behind Mirabeau with a fine pell-mell freedom of artistic effect, is a portrait. The effect is like that of similar works designed and executed with the large leisure of an age very different from the competition and struggling hurry of our own. In every respect this work is as French as it is individual. It is penetrated with a sense of the dignity of French history. It is as far as possible removed from the cheap *genre* effect such a scheme in less skillful hands might easily have had. Mirabeau's gesture, in fact his entire presence, is superb, but the Marquis is as fine in his way as the tribune in his. The beholder assists at the climax of a great crisis, unfolded to him in the impartial spirit of true art, quite without partisanship, and though manifestly stimulated by sympathy with the nobler cause, even more acutely conscious of the grandeur of the struggle and the distinction of those on all sides engaged in it, and acquiring from these a kind of elation of exaltation such as the Frenchman experiences only when he may give expression to his artistic and his patriotic instincts at the same moment.

The distinctly national qualities of this masterpiece and their harmonious association with the individual characteristics of M. Dalou, his love of nature, his native distinction, his charm, and his power, in themselves bear eminent witness to the vitality of modern French sculpture, in spite of all the influences which tend to petrify it with system and convention. M. Rodin stands so wholly apart that it would be unsafe perhaps to argue confidently from his impressive works the potentiality of periodical renewal in an art over which the Institute presides with still so little challenge of its title. But it is different with M. Dalou. Extraordinary as his talent is, its unquestioned and universal recognition is probably in great measure due to the preparedness of the environment to appreciate extraordinary work of the kind to the high degree which French popular esthetic education, in a word, has reached. And one's last word about contemporary French sculpture — even in closing a consideration of the works of such protestants as Rodin and Dalou — must be a recognition of the immense service of the Institute in education of this kind. Let some country without an institute, around which what esthetic feeling the age permits may crystallize, however sharply, give us a Rodin and a Dalou!

W. C. Brownell.

THE PAWNBROKER.

IN some grim purlieu doth he dwell, that seems
 Always, through tricks of sorcery, midnight's lair;
 Above his door, in lamplight's flickering gleams,
 Darts out the shadowy word that reads "Despair."

With marble face, with quick insidious hand
 Whose fingers glide like pale snakes to and fro,
 Behind his dark-barred grating doth he stand,
 To meet the timorous forms that come and go.

Each with some treasured offering that allures
 His look and wins from it sardonic glee,
 These vague and variant forms are mine, are yours,
 Yes, even are thousands wild and weak as we.

Love, pride, hope, honor, fame, year after year
 We pawn him, by infatuate ardors urged,
 Then grasp the coin he doles, and disappear
 Back in the swallowing gloom whence we emerged.

But oft, with pay close-clutched, while hurrying o'er
 His threshold, bent on our fleet homeward course,
 We cast one farewell glance at his dim door,
 And in the dubious lamplight read "Remorse!"

Edgar Fawcett.

LIFE IN THE WHITE HOUSE IN THE TIME OF LINCOLN.

HE daily life of the White House during the momentous years of Lincoln's presidency had a character of its own, different from that of any previous or subsequent time. In the first days after the

inauguration there was the unprecedented rush of office-seekers, inspired by a strange mixture of enthusiasm and greed, pushed by motives which were perhaps at bottom selfish, but which had nevertheless a curious touch of that deep emotion which had stirred the heart of the nation in the late election. They were not all ignoble; among that dense crowd that swarmed in the staircases and the corridors there were many well-to-do men who were seeking office to their own evident damage, simply because they wished to be a part, however humble, of a government which they had aided to put in power and to which they were sincerely devoted. Many of the visitors who presented so piteous a figure in those early days of 1861 afterwards marched, with the independent dignity of a private soldier, in the ranks of the Union Army, or rode at the head of their regiments like men born to command. There were few who had not a story worth listening to, if there were time and opportunity. But the numbers were so great, the competition was so keen, that they ceased for the moment to be regarded as individuals, drowned as they were in the general sea of solicitation.

Few of them received office; when, after weeks of waiting, one of them got access to the President, he was received with kindness by a tall, melancholy-looking man sitting at a desk with his back to a window which opened upon a fair view of the Potomac, who heard his story with a gentle patience, took his papers and referred them to one of the Departments, and that was all; the fatal pigeon-holes devoured them. As time wore on and the offices were filled the throng of eager aspirants diminished and faded away. When the war burst out an immediate transformation took place. The house was again invaded and overrun by a different class of visitors—youths who wanted commissions in the regulars; men who wished

to raise irregular regiments or battalions without regard to their State authorities; men who wanted to furnish stores to the army; inventors full of great ideas and in despair at the apathy of the world; later, an endless stream of officers in search of promotion or desirable assignments. And from first to last there were the politicians and statesmen in Congress and out, each of whom felt that he had the right by virtue of his representative capacity to as much of the President's time as he chose, and who never considered that he and his kind were many and that the President was but one.

It would be hard to imagine a state of things less conducive to serious and effective work, yet in one way or another the work was done. In the midst of a crowd of visitors who began to arrive early in the morning and who were put out, grumbling, by the servants who closed the doors at midnight, the President pursued those labors which will carry his name to distant ages. There was little order or system about it; those around him strove from beginning to end to erect barriers to defend him against constant interruption, but the President himself was always the first to break them down. He disliked anything that kept people from him who wanted to see him, and although the continual contact with importunity which he could not satisfy, and with distress which he could not always relieve, wore terribly upon him and made him an old man before his time, he would never take the necessary measures to defend himself. He continued to the end receiving these swarms of visitors, every one of whom, even the most welcome, took something from him in the way of wasted nervous force. Henry Wilson once remonstrated with him about it: "You will wear yourself out." He replied, with one of those smiles in which there was so much of sadness, "They don't want much; they get but little, and I must see them." In most cases he could do them no good, and it afflicted him to see he could not make them understand the impossibility of granting their requests. One hot afternoon a private soldier who had somehow got access to him persisted, after repeated explanations that his case was one to be settled by his immediate superiors, in begging that the President would give it his personal attention. Lincoln at last burst out: "Now, my man, go away! I cannot attend

to all these details. I could as easily bail out the Potomac with a spoon."

Of course it was not all pure waste; Mr. Lincoln gained much of information, something of cheer and encouragement, from these visits. He particularly enjoyed conversing with officers of the army and navy, newly arrived from the field or from sea. He listened with the eagerness of a child over a fairy tale to Garfield's graphic account of the battle of Chickamauga; he was always delighted with the wise and witty sailor talk of John A. Dahlgren, Gustavus V. Fox, and Commander Henry A. Wise. Sometimes a word fitly spoken had its results. When R. B. Ayres called on him in company with Senator Harris, and was introduced as a captain of artillery who had taken part in a recent unsuccessful engagement, he asked, "How many guns did you take in?" "Six," Ayres answered. "How many did you bring out?" the President asked, maliciously. "Eight." This unexpected reply did much to gain Ayres his merited promotion.

The President rose early, as his sleep was light and capricious. In the summer, when he lived at the Soldiers' Home, he would take his frugal breakfast and ride into town in time to be at his desk at eight o'clock. He began to receive visits nominally at ten o'clock, but long before that hour struck the doors were besieged by anxious crowds, through whom the people of importance, senators and members of congress, elbowed their way after the fashion which still survives. On days when the Cabinet met, Tuesdays and Fridays, the hour of noon closed the interviews of the morning. On other days it was the President's custom, at about that hour, to order the doors to be opened and all who were waiting to be admitted. The crowd would rush in, thronging the narrow room, and one by one would make their wants known. Some came merely to shake hands, to wish him God-speed; their errand was soon done. Others came asking help or mercy; they usually pressed forward, careless, in their pain, as to what ears should overhear their prayer. But there were many who lingered in the rear and leaned against the wall, hoping each to be the last, that they might in tête-à-tête unfold their schemes for their own advantage or their neighbors' hurt. These were often disconcerted by the President's loud and hearty, "Well, friend, what can I do for you?" which compelled them to speak, or retire and wait for a more convenient season.

The inventors were more a source of amusement than annoyance. They were usually men of some originality of character, not infrequently carried to eccentricity. Lincoln had

a quick comprehension of mechanical principles, and often detected a flaw in an invention which the contriver had overlooked. He would sometimes go out into the waste fields that then lay south of the Executive Mansion to test an experimental gun or torpedo. He used to quote with much merriment the solemn dictum of one rural inventor that "a gun ought not to rekyle; if it rekyled at all, it ought to rekyle a little forrid." He was particularly interested in the first rude attempts at the afterwards famous mitrailleuses; on one occasion he worked one with his own hands at the Arsenal, and sent forth peals of Homeric laughter as the balls, which had not power to penetrate the target set up at a little distance, came bounding back among the shins of the bystanders. He accompanied Colonel Hiram Berdan one day to the camp of his sharpshooters and there practised in the trenches his long-disused skill with the rifle. A few fortunate shots from his own gun and his pleasure at the still better marksmanship of Berdan led to the arming of that admirable regiment with breech-loaders.

At luncheon time he had literally to run the gantlet through the crowds who filled the corridors between his office and the rooms at the west end of the house occupied by the family. The afternoon wore away in much the same manner as the morning; late in the day he usually drove out for an hour's airing; at six o'clock he dined. He was one of the most abstemious of men; the pleasures of the table had few attractions for him. His breakfast was an egg and a cup of coffee; at luncheon he rarely took more than a biscuit and a glass of milk, a plate of fruit in its season; at dinner he ate sparingly of one or two courses. He drank little or no wine; not that he remained always on principle a total abstainer, as he was during a part of his early life in the fervor of the "Washingtonian" reform; but he never cared for wine or liquors of any sort, and never used tobacco.

There was little gaiety in the Executive house during his time. It was an epoch, if not of gloom, at least of a seriousness too intense to leave room for much mirth. There were the usual formal entertainments, the traditional state dinners and receptions, conducted very much as they have been ever since. The great public receptions, with their vast rushing multitudes pouring past him to shake hands, he rather enjoyed; they were not a disagreeable task to him, and he seemed surprised when people commiserated him upon them. He would shake hands with thousands of people, seemingly unconscious of what he was doing, murmuring some monotonous salutation as they went by, his eye dim, his thoughts far

withdrawn; then suddenly he would see some familiar face,—his memory for faces was very good,—and his eye would brighten and his whole form grow attentive; he would greet the visitor with a hearty grasp and a ringing word and dismiss him with a cheery laugh that filled the Blue Room with infectious good nature. Many people armed themselves with an appropriate speech to be delivered on these occasions, but unless it was compressed into the smallest possible space it never got utterance; the crowd would jostle the peroration out of shape. If it were brief enough and hit the President's fancy, it generally received a swift answer. One night an elderly gentleman from Buffalo said, "Up our way, we believe in God and Abraham Lincoln," to which the President replied, shoving him along the line, "My friend, you are more than half right."

During the first year of the administration the house was made lively by the games and pranks of Mr. Lincoln's two younger children, William and Thomas: Robert, the eldest, was away at Harvard, only coming home for short vacations. The two little boys, aged eight and ten, with their Western independence and enterprise, kept the house in an uproar. They drove their tutor wild with their good-natured disobedience; they organized a minstrel show in the attic; they made acquaintance with the office-seekers and became the hot champions of the distressed. William was, with all his boyish frolic, a child of great promise, capable of close application and study. He had a fancy for drawing up railway time-tables, and would conduct an imaginary train from Chicago to New York with perfect precision. He wrote childish verses, which sometimes attained the unmerited honors of print. But this bright, gentle, studious child sickened and died in February, 1862. His father was profoundly moved by his death, though he gave no outward sign of his trouble, but kept about his work the same as ever. His bereaved heart seemed afterwards to pour out its fullness on his youngest child. "Tad" was a merry, warm-blooded, kindly little boy, perfectly lawless, and full of odd fancies and inventions, the "chartered libertine" of the Executive Mansion. He ran continually in and out of his father's cabinet, interrupting his gravest labors and conversations with his bright, rapid, and very imperfect speech—for he had an impediment which made his articulation almost unintelligible until he was nearly grown. He would perch upon his father's knee, and sometimes even on his shoulder, while the most weighty conferences were going on. Sometimes escaping from the domestic authorities, he would take refuge in that sanctuary for the whole evening, dropping to sleep at last on the floor,

when the President would pick him up and carry him tenderly to bed.

Mr. Lincoln's life was almost devoid of recreation. He sometimes went to the theater, and was particularly fond of a play of Shakspeare well acted. He was so delighted with Hackett in *Falstaff* that he wrote him a letter of warm congratulation which pleased the veteran actor so much that he gave it to the "New York Herald," which printed it with abusive comments. Hackett was greatly mortified and made suitable apologies; upon which the President wrote to him again in the kindest manner, saying:

Give yourself no uneasiness on the subject. . . . I certainly did not expect to see my note in print; yet I have not been much shocked by the comments upon it. They are a fair specimen of what has occurred to me through life. I have endured a great deal of ridicule, without much malice; and have received a great deal of kindness, not quite free from ridicule. I am used to it.

This incident had the usual sequel: the veteran comedian asked for an office, which the President was not able to give him, and the pleasant acquaintance ceased. A hundred times this experience was repeated: a man whose disposition and talk were agreeable would be introduced to the President; he took pleasure in his conversation for two or three interviews, and then this congenial person would ask some favor impossible to grant, and go away in bitterness of spirit. It is a cross that every President must bear.

Mr. Lincoln spent most of his evenings in his office, though occasionally he remained in the drawing-room after dinner, conversing with visitors or listening to music, for which he had an especial liking, though he was not versed in the science, and preferred simple ballads to more elaborate compositions. In his office he was not often suffered to be alone; he frequently passed the evening there with a few friends in frank and free conversation. If the company was all of one sort he was at his best; his wit and rich humor had free play; he was once more the Lincoln of the Eighth Circuit, the cheeriest of talkers, the riskiest of story tellers; but if a stranger came in he put on in an instant his whole armor of dignity and reserve. He had a singular discernment of men; he would talk of the most important political and military concerns with a freedom which often amazed his intimates, but we do not recall an instance in which this confidence was misplaced.

Where only one or two were present he was fond of reading aloud. He passed many of the summer evenings in this way when occupying his cottage at the Soldiers' Home. He

would there read Shakspeare for hours with a single secretary for audience. The plays he most affected were "Hamlet," "Macbeth," and the series of Histories; among these he never tired of "Richard the Second." The terrible outburst of grief and despair into which *Richard* falls in the third act had a peculiar fascination for him. I have heard him read it at Springfield, at the White House, and at the Soldiers' Home.

For heaven's sake, let us sit upon the ground,
And tell sad stories of the death of kings :—
How some have been deposed, some slain in war,
Some haunted by the ghosts they have deposed ;
Some poisoned by their wives, some sleeping killed ;
All murdered :—For within the hollow crown
That rounds the mortal temples of a king
Keeps Death his court ; and there the antic sits,
Scoffing his state, and grinning at his pomp,—
Allowing him a breath, a little scene
To monarchize, be feared, and kill with looks ;
Infusing him with self and vain conceit,—
As if this flesh, which walls about our life,
Were brass impregnable,—and humored thus,
Comes at the last, and with a little pin
Bores through his castle walls and—farewell, King !

He read Shakspeare more than all other writers together. He made no attempt to keep pace with the ordinary literature of the day. Sometimes he read a scientific work with keen appreciation, but he pursued no systematic course. He owed less to reading than most men. He delighted in Burns; he said one day after reading those exquisite lines to Glencairn, beginning, "The bridegroom may forget the bride," that "Burns never touched a sentiment without carrying it to its ultimate expression and leaving nothing further to be said." Of Thomas Hood he was also excessively fond. He often read aloud "The Haunted House." He would go to bed with a volume of Hood in his hands, and would sometimes rise at midnight and traversing the long halls of the Executive Mansion in his night clothes would come to his secretary's room and read aloud something that especially pleased him. He wanted to share his enjoyment of the writer; it was dull pleasure to him to laugh alone. He read Bryant and Whittier with appreciation; there were many poems of Holmes's that he read with intense relish. "The Last Leaf" was one of his favorites; he knew it by heart, and used often to repeat with deep feeling:

The mossy marbles rest
On the lips that he has pressed
In their bloom,
And the names he loved to hear
Have been carved for many a year
On the tomb;

giving the marked Southwestern pronunciation of the words "hear" and "year." A poem by William Knox, "Oh, why should the Spirit of Mortal be Proud?" he learned by heart in his youth, and used to repeat all his life.

Upon all but two classes the President made the impression of unusual power as well as of unusual goodness. He failed only in the case of those who judged men by a purely conventional standard of breeding, and upon those so poisoned by political hostility that the testimony of their own eyes and ears became untrustworthy. He excited no emotion but one of contempt in the finely tempered mind of Hawthorne; several English tourists have given the most distorted pictures of his speech and his manners. Some Southern writers who met him in the first days of 1861 spoke of him as a drunken, brawling boor, whose mouth dripped with oaths and tobacco, when in truth whisky and tobacco were as alien to his lips as profanity. There is a story current in England, as on the authority of the late Lord Lyons, of the coarse jocularity with which he once received a formal diplomatic communication; but as Lord Lyons told the story there was nothing objectionable about it. The British Minister called at the White House to announce the marriage of the Prince of Wales. He made the formal speech appropriate to the occasion; the President replied in the usual conventional manner. The requisite formalities having thus been executed, the President took the bachelor diplomatist by the hand, saying, "And now, Lord Lyons, go thou and do likewise."

The evidence of all the men admitted to his intimacy is that he maintained, without the least effort or assumption, a singular dignity and reserve in the midst of his easiest conversation. Charles A. Dana says, "Even in his freest moments one always felt the presence of a will and an intellectual power which maintained the ascendancy of the President." In his relations to his Cabinet "it was always plain that he was the master and they were the subordinates. They constantly had to yield to his will, and if he ever yielded to them it was because they convinced him that the course they advised was judicious and appropriate." While men of the highest culture and position thus recognized his intellectual primacy there was no man so humble as to feel abashed before him. Frederick Douglass beautifully expressed the sentiment of the plain people in his company: "I felt as though I was in the presence of a big brother and that there was safety in his atmosphere."

As time wore on and the war held its terrible course, upon no one of all those who lived through it was its effect more apparent than

upon the President. He bore the sorrows of the nation in his own heart; he suffered deeply not only from disappointments, from treachery, from hope deferred, from the open assaults of enemies, and from the sincere anger of discontented friends, but also from the world-wide distress and affliction which flowed from the great conflict in which he was engaged and which he could not evade. One of the most tender and compassionate of men, he was forced to give orders which cost thousands of lives; by nature a man of order and thrift, he saw the daily spectacle of unutterable waste and destruction which he could not prevent. The cry of the widow and the orphan was always in his ears; the awful responsibility resting upon him as the protector of an imperiled republic kept him true to his duty, but could not make him unmindful of the intimate details of that vast sum of human misery involved in a civil war.

Under this frightful ordeal his demeanor and disposition changed—so gradually that it would be impossible to say when the change began; but he was in mind, body, and nerves a very different man at the second inauguration from the one who had taken the oath in 1861. He continued always the same kindly, genial, and cordial spirit he had been at first; but the boisterous laughter became less fre-

quent year by year; the eye grew veiled by constant meditation on momentous subjects; the air of reserve and detachment from his surroundings increased. He aged with great rapidity.

This change is shown with startling distinctness by two life-masks—the one made by Leonard W. Volk in Chicago, April, 1860, the other by Clark Mills in Washington, in the spring of 1865. The first is of a man of fifty-one, and young for his years. The face has a clean, firm outline; it is free from fat, but the muscles are hard and full; the large mobile mouth is ready to speak, to shout, or laugh; the bold, curved nose is broad and substantial, with spreading nostrils; it is a face full of life, of energy, of vivid aspiration. The other is so sad and peaceful in its infinite repose that the famous sculptor Augustus Saint-Gaudens insisted, when he first saw it, that it was a death-mask. The lines are set, as if the living face, like the copy, had been in bronze; the nose is thin, and lengthened by the emaciation of the cheeks; the mouth is fixed like that of an archaic statue; a look as of one on whom sorrow and care had done their worst without victory is on all the features; the whole expression is of unspeakable sadness and all-sufficing strength. Yet the peace is not the dreadful peace of death; it is the peace that passeth understanding.

John Hay.

THE COURAGEOUS ACTION OF LUCIA RICHMOND.

(Manuscript found in a chest in the garret over the left wing of the old Richmond House.)

WHEN my dear Miss Silence died I was twenty, and it was then that I went back to the old house whence she took me, when I was two years old, from my dying mother's arms.

Miss Silence was my mother's old teacher and her dearest friend. For sixty years she taught school, and had made pens enough in that time, she herself said, to have written all the books in the English language. She had such a knack at a nib, soft but not too soft, fine but not too fine, that even Priest Ransom and 'Squire Amasa used to send in their quills for her to make. And this they would not have condescended to do to another woman in the parish, and not to Miss Silence if she had not been a maid; for the priest taught and the 'squire believed that a married woman should be in subjection to her husband, and it would be

unbecoming in her to set up to make so much as a quill pen on her own responsibility.

Miss Silence kept a school for girls, for girls were not taught at the public expense. To do that would have been considered a waste of money; yea, more than a waste, for it would have been putting woman where God in his providence had not intended her to be put. Priest Ransom's own mother could only make her mark, and he considered learning a dangerous thing for a woman to meddle with. A woman if she wanted to know anything must ask her husband. And if she had no husband, as is the misfortune of many women, why, there was always the minister of the parish, whose solemn duty it was to look after the weaklings of his flock.

Miss Silence herself was a learned woman. That Priest Ransom admitted. She was taught by her father, who had no son. He was a minister, and fitted young men for college in his family. Miss Silence, who had a great hunger

for learning, as happens to a woman now and then, got her first taste of it from overhearing the young men recite their lessons; afterwards she studied these lessons privately, as a thing to be ashamed of, for so it was considered. But one day her father coming in and finding her so absorbed that she did not answer when spoken to, and wondering much if it could be her sampler which she had been at work on for two years and had not finished, she hated it so, he came up behind and looked over her shoulder, and lo! she was reading the Greek Sophocles in a low voice to herself, the words dropping from her lips sweet and clear as the honey of Hymettus.

He was so surprised that he could not speak for some moments. Miss Silence's first thought was to clap the book behind her. Then she stood up proudly and confessed what she had done, and that she could read Latin as well as Greek and knew her Euclid. When he saw how eager she was he did not chide her as she had feared and expected he would, but he patted her head gently and said: "Is it indeed so, my little maid? Are you too longing to eat of the tree of knowledge of good and evil? Well; so be it. It is like thy own dear mother before thee." And after that he taught her as he would a son.

Such was her learning, indeed, that it was whispered about that Priest Ransom had once consulted her concerning a doubtful passage in the Greek Testament. It was only a surmise, for no one durst ask him whether it was so. The entire town stood in wholesome awe of him, as they should of one of God's anointed ministers; and we young women always stood to one side and dropped our deepest courtesies when we met him, which he acknowledged or not as he pleased.

Miss Silence did not instruct the girls of her school in Greek. Even she thought that such knowledge as that was too much for all but the select among women. But happily for me, she looked upon me—whether worthily so or not is not for me to say—as one of the select women vouchsafed by Providence to our generation, and taught me all that I was capable of receiving. For, to her lasting regret, I never took to Greek.

You have asked me, my dear daughter, to write it all out for you how I laid the ghost, and you may think I have wandered far from my subject in what I have been telling you, and that all this can have no connection whatever with that remarkable experience. But it seems to me necessary to a true understanding of my action that you should know under what influences I was bred—that you should know something concerning my dear Miss Silence, without whose teaching and example I am sure

I should never have had the courage and presence of mind to do what I did.

I am, as you know, through my mother and grandmother Sturtevant a lineal descendant of Captain Benjamin Church the Indian fighter—as brave a man as ever trod shoe-leather or carried a musket. My mother and my grandmother before me were fearless women, and stood in no awe even of an Indian in his war paint; though always ready to give him the go-by when it could be done, thinking that true courage is not bravado or foolhardiness, but the standing up to a thing when you see you must and it is right.

So by right of inheritance I was never a coward, and as I grew up never flinched at danger, not even when 'Squire Amasa's great Scotch bull came at me when I was thirteen years old with his ugly head lowered and his sharp horns pointed and his eyes like live coals. But I stood to meet him, and off with my striped blanket and threw it over his head when he was two feet off, and so had time to climb the great oak in the ridge pasture.

Miss Silence always said that courage like that by inheritance was not the kind to be justly proud of; that it was good to have strong nerves and a heart that beats regularly no matter what happened, but it was better to have a courage grounded upon reason; and that women especially made themselves weak by believing in all sorts of signs and superstitions—such as the fork falling and sticking into the floor, which was a stranger coming; or a snuff in the candle, which was a coffin.

But Priest Ransom encouraged his wife in these superstitions, for he liked to see women live up to his ideas of them.

Yet Miss Silence did not disbelieve in ghosts, though she said they walked a good deal less than folks thought. She said she believed with *Prince Hamlet* in Mr. Shakspeare's play:

I do not set my life at a pin's fee;
And, for my soul, what can it do to that,
Being a thing immortal as itself?

She said that *Prince Hamlet* acted like a reasonable being—though some folks do say now he was crazy—and as a dutiful son should. She would not be a mite afraid herself to meet her father's ghost any time of day or night; though it was not a thing likely to happen to a God-fearing Hopkinsian minister, whose flesh was resting in hope, to be condemned to wander nights and to spend his days in purgatory, seeing that he never believed in purgatory.

But it is possible that Miss Silence might have entertained a different opinion concerning a ghost with no body at all. Of that, however, I cannot speak with knowledge, never having

heard her give her opinion thereupon. To my own mind it is a much more fearsome thing to hear the footsteps of a being you cannot see than to look upon the most direful shape a restless spirit ever took on. Such we read was the experience of Eliphaz the Temanite, the hair of whose flesh stood up and the very bones within him did shake when a spirit breathed upon his face and he could not discern any appearance thereof. Such a formless ghost it was that haunted the house wherein had dwelt my ancestors even to the fourth generation.

The ghost that walked in that old ancestral home was that of a young girl, my father's only sister, who had taken her own life by violence when she was eighteen years old. Her father (and my grandfather) was a man of high spirit, proud of his ancestry, proud of his social eminence, proud of his inherited wealth, which had not been acquired through trade, but which at his death was found to have melted away like a late snow under an April sun. He was kind and even generous to those below him in the social scale so long as they kept their places, but hard towards any who wished to rise, as it is right and proper for men to do in our free Republic. And when a poor young man, the son of a blacksmith, fell in love with his only daughter and she with him, he had nothing but scorn and deep anger for that love. And though the young man was a good young man and of excellent promise, of a superior mind and a scholar, he would not hear of their marriage.

Such however was the girl's resolution and iron will, being the true daughter of her father, that she would have married her lover in spite of him. But one day he came to her with tales to her lover's discredit, and he brought such proofs of his unfaithfulness to her that it was not in human reason to doubt. She wrote him a little letter of dismissal, and only two days after he was thrown from his horse and killed. Then it came out that the tales were false, and that they were the work of one who would fain have married this young girl, and one whom her father favored. The truth coming to her ears she went raving mad, and getting away from her watchers while they slept, she hanged herself at eleven o'clock of the night in the high and wide garret over the left wing. The rope broke and she fell, but she was quite dead when the watchers, having awakened from their sleep, sought and found her.

It was not long before her father followed her to the grave, his iron will at last broken, and mourning as one without hope for her who when alive in her young beauty had been the very light of his eyes and pride of his heart.

Then my mother, who had lived in the house ever after her marriage to my father, died also, and the house was shut up and no one could be induced to live in it. For even before my mother's death — yea, even before that of my grandfather, so my mother told Miss Silence — the ghost had begun to walk, coming in with soft-falling footsteps at eleven o'clock of the night, void and without shape, and going slowly up the stairs to the high, wide garret, of which at its approach the door swung open without touch of mortal fingers. The fearful listeners below would hear a heavy chest dragged, just as the poor mad creature had dragged it in her frenzy, up under the piece of rope that hung fastened from the staple in the wall, and then after another moment of horror would be heard the falling of the body, followed by the soft-falling footsteps descending the stairs.

When my dear Miss Silence died I was, as it were, turned out of doors, though she fain would have bequeathed to me the small but endeared house in which the greater part of my life had been spent within the shelter of her love. But she had only a life interest in the dwelling and its furniture, as is commonly the case with women, who are thought hardly fit to be trusted with the use of property during life, much less with the disposal of it by will at death. So there was nothing for me to do but to go back to the old house which had fallen to me by inheritance, and whence she had taken me from my dying mother's arms.

On the tenth morning after she had been laid to rest in her grave on the hill Silas Crowde carried me, my chests of blankets and household linen of my own spinning and weaving, — some of the tablecloths and towels being woven in a thistle pattern of Miss Silence's own devising, the rest being in the snow-drop, which has ever been a favorite in our family, — my box of clothing, my pewter, my mother's china, which had been kept in store for me, my bed of live-geese feathers, and my books, in his ox-cart over to Parting Ways, where the old house stood and still stands, back from the highway, with only one other house in sight, the village being hidden by a turn in the road and a thick pine wood.

It is true that the women of Triphammer, where Miss Silence had lived, remonstrated with me for my headiness in going back to the haunted house, and Mrs. Ransom even said that it was a bearding of Providence, which if persisted in would most likely and rightly bring down upon my head a fearful judgment and condemnation.

"But what else can I do?" I was fain to ask at last, though more out of defense than

from any notion of acting upon the advice of these women who had assembled in Miss Silence's keeping-room the day before my departure to inquire into my concerns, to offer vain counsel, and to drink for the last time of Miss Silence's tea, famous for its strength and staying qualities, and of which a few drawings still remained in the bottom of the blue and gilt tea-caddy.

Not one of them spoke in answer to my question, but went on sipping their tea with loud sips, and casting their eyes down into their cups, being in that condition of mind women-folks are apt to be in when brought up short from their ramblings by a pointed question. Then they looked each at the others, and Mrs. Ransom spoke first, as belonged to her by right to do, seeing she was Priest Ransom's wife and so the first woman in the parish.

"To my mind," she said, "it's a sight properer and more in agreement to scriptur' and the teachin's of the 'postle Paul for a young maid to marry than to go away by herself and live all alone in a house. And it's contrary to natur' as well as scriptur', women bein' the weaker vessel, and so to be keered for." She paused here, but no one spoke, and she again took up the thread of her discourse. "There's Cyrus Martin. His wife Sarah Jane has been dead nigh onto eight months, and him with five small child'en, and 'leven cows, and nobody to do a stroke o' work except for wages. He 'd be tickled enough to have y'. And he's a good provider,—a leetle close, mebbe,—and you 'll have a good home, and a husband to cherish y', and split yer kindlin's, and fetch in rain, and hang out your clo'es when it rains. He was dretful good to Sarah Jane, and he 'd only have to be spoke to to think on 't. He's be'n lookin' round. But law! I don't s'pose he ever thought o' you, a-livin' so with Miss Silence, and she feelin' so superior, bein' a minister's darter and havin' an edication. But 't ain't safe to look too high, and every woman can't marry a minister or doctor or even a store-keeper. And a good likely farmer with means ain't to be despised. And what Miss Silence left y' in the bank will come handy to buy that medder land Cyrus has be'n wantin', and —"

"Don't y' never let that money go to buy medder land for the best man that ever breathed. That's my advice to y'." It was Mrs. Silas Crowde who was speaking. She had come in just as Mrs. Ransom was beginning her discourse, and had been waiting for her to end. But seeing no prospect thereto she now burst in without further ceremony. "Men are human bein's, the best on 'em, with sights o' human natur'. And the minute they

get their clutch onto your money it's gone and you 'll never have any good on 't. I know all about it. I married Silas Crowde and brought him a dowry of a hund'ed acres o' woodland, good pine and oak timber for ship-buildin'. And he's made sights o' money out on 't, and not a cent of it is mine, nor never will be. And I've be'n a faithful, hard-workin' wife to him, if I do say it. He's made his will and give the heft on 't to his son by his fust wife. And he's goin' to leave our Mahala two hund'ed dollars, and myself 'll have the widdier's thirds and that's all. And Silas is as good's they 'll av'ridge. No, Lucia Richmond, as long's the marriage laws are what they be and give a woman up to her husband, soul and body and property, you 'd better go and live with ghosts enough sights and take your chance, and —"

But here, sick at heart, I stole away and left them to settle it among themselves, and went and sat down in the chair in my dear Miss Silence's bedroom where she used to sit and talk with me in tender, serious, motherly fashion; and I am not ashamed to confess that I cried heartily, and kissed the chair and the pillows of her bed.

It was the latter part of December, a showery day, that Silas Crowde took me home; for so I began to call it then, and have continued to do ever since. The old house was damp and the furniture fallen much awry, and the spiders, its sole occupants through all these years, had spun their webs across doors and windows. We went from room to room, and I fixed upon the southeast room and the bedroom above it as being the most habitable, and in them Silas set my goods. He cut up the fallen branches with which the ground around the house was thickly strewn, and built a noble fire in each fireplace, which blazed and crackled in a truly enlivening manner.

When he had gone I hung the teakettle to boil on the crane in the lower room, and then went out on the upper porch to look about me a little, for the sun had broken through the clouds and was making a glorious setting. I opened the door leading from the upper hall with difficulty, owing to its long disuse. I watched Silas down the long avenue of Lombardy poplars till he was out of sight. I experienced a feeling of pleasure at being thus left alone. Silas had gone away expressing great pity for me, of which, however, I did not feel the need — not so far as living in the old house was concerned. For I cared nothing for the ghost, knowing of it only by hearsay, and that so little that I had fallen into a disbelief of it. I was filled with pleasure only at having a house all my own and to myself, since I could

no longer be with my dear Miss Silence. For I was always of a reserved nature, like my revered father, who had died in the East Indies before my birth, and cared for but few, and would always rather be alone if I could not have the company I enjoyed.

I lingered a long time on the porch, sitting upon its stout balustrade. I have been all my life a lover of the curious and secret ways of nature, and I observed, as I had often done before, how the leaves of the great elm, the branches whereof swept the porch floor, were evenly wet with moisture, while those of the locusts held theirs in the form of drops, like living jewels, which at the lightest touch of breeze or finger dropped sparkling to the grass below, leaving them as dry as in the heat of a summer's day.

The clouds in great thunder-heads fled into the east before the rays of the parting sun. A few lingered in his light and were changed to gold or a delicate pink, like the pink of the sweet-brier rose. The open sky, by reason of contrast with those clouds of pink and gold, was a most pellucid blue, and in its azure depths they floated in security, an emblem, I could but think, of the souls that dwell in the deeps of God's love, of which this fathomless sky was only a faint and feeble type.

As the night drew on I went in, fastened the outer doors, and closed the shutters of the upper room. I then drew up to the fire the round, light stand, whereon I placed a candle of my own molding from the small store I had brought, and then drank my tea, which I have all my life considered the most comfortable and comforting of beverages. I then read aloud the ninety-first Psalm, which my dear Miss Silence called her "staff," and, following her instructions of "early to bed and early to rise," covered up the embers, climbed into the curtained bed in the corner, and so under the refuge of His wings laid me down and slept in peace, and was awakened by the sun, once more in the east and sending his earliest beams through the heart-shaped openings in the tops of the shutters.

All the next morning I was pleasantly busied in putting my household goods in place, looking into every cranny in the house, and in the afternoon walking in the old garden in its almost obliterated paths and amid its wild tangles of box, lilac, sweet-brier, and Southern bush. So, perhaps, it was because of over-fatigue that I did not readily fall asleep that night, but lay tossing behind the heavy curtains. The embers flamed up from their ashes and died out just as the clock in the room below struck the hour of eleven. I was then sinking into a gentle doze when I was aroused by the sound of soft-falling foot-

steps, heard distinctly through the partition which separated my bedchamber from the staircase leading to the high, wide garret in the left wing. I was half asleep and half awake, in that inexplicable state which is neither the one nor the other, and in which the most grotesque as well as the most rational thoughts seem to have equal place. This condition of mind, which lasted perhaps a few seconds, though seemingly of much longer duration, suddenly gave way to a mortal terror, which seized upon me and brought me sitting up in bed, holding the curtains down with a frenzied clutch, and saying to myself, "The ghost!" while I shivered in every nerve of my body. Had the footsteps hesitated one instant at my door I know I should have shrieked aloud, so entirely had I lost control of my powers, both mental and physical. But they did not pause. They went on with that soft-measured pace such as characterizes no mortal footsteps. I heard the dragging of the chest, the falling of the body, the footsteps descending, and then I aroused from my irrational terror. I sprang out of bed and piled the branches of pine upon the coals until they roared in a vast flame up the chimney and lighted every corner of the room like noonday. For I have ever found that light scatters quickly the phantoms that people the darkness. Then, after again commending myself to that Being who holds all the powers of the supernatural as well as the natural world in his keeping, I fell asleep.

The next day I meditated much and deeply upon my situation. This was my home. I had none other in all the wide world, neither did I wish to have. It was the home of my forefathers, and as such I loved it. Its time-stained walls were inexpressibly dear to me. Within them my mother had passed the few brief years of her married life. Here she had given birth to me, and from here she had passed into eternity. In this house I felt I must remain. Not for even a brief moment could I bring myself to entertain the idea of giving it up. Of the ghost I, of a truth, was not really afraid; at least, not when wide awake and in full possession of my powers of mind. Should I then suffer it to drive me hence when under the spell of half-waking visions, themselves specters of the imagination such as my dear Miss Silence would have scouted? No, I answered; I would remain. But, I further reflected, it would be necessary to guard against the possibility of being again overtaken by such mortal though causeless terror as was that of the previous night. Therefore I resolved to meet the ghost only when wide awake.

So that night I did not go to bed at my

usual hour of nine, but sat up, and as the hour of eleven drew nigh I heaped the wood high upon the fire, and drew up a large old chair to that corner of the hearth opposite the one wherein I sat with my knitting. As the clock struck the last note of the hour I heard the soft-falling footsteps ascending the stairs. I breathed a brief prayer for help and guidance, feeling of a surety that these would be vouchsafed me in this that I had determined upon doing, and then, hastening to the door opening upon the staircase that led up into the high, wide garret of the left wing, I threw it wide open.

The cheerful gleam of the firelight fell out upon the landing in a broad square. As the steps drew nigh I spoke. "Enter, poor wandering spirit," I said, "and stay your weary footsteps in the home of a friend."

For a brief space, as a bird might lift its wing, or a minnow dart for its prey through the sunny shallows of Stony Brook, the footsteps stayed in their course at my door, and then passed on, going softly yet resolutely up the oaken staircase, the door of the garret swinging noiselessly open at their approach. I did not close the door. I stood and held it open while I listened to the dragging of the chest, the fall of the body, and the footsteps descending. As they crossed the square of firelight no shadow fell thereon, and as they ceased below I shut my door. I was calm, and not a tremor shook my nerves. I went to bed and slept until the cock's clarion announced the approach of another day.

The next night at the coming of the footsteps I again spoke, and with greater urgency. "Why will you not enter, poor wandering spirit," I said, "and stay your weary footsteps in the chamber of a friend?"

As these words of invitation fell from my lips again did the footsteps pause at my door an almost imperceptible instant. Then they entered, and I closed it.

"Sit here," I said; and I pointed to the large old chair which I had drawn up, as before, in the corner of the hearth opposite my own. I spoke in my own tongue, which was also that of her whose ghost I addressed. For though Priest Ransom had ever affirmed and insisted that the spirits of the dead spake in Hebrew alone, that being the language of Jehovah's chosen people and of his covenants and commandments, yet my dear Miss Silence would never admit it as at all probable, seeing the New Testament was written in Greek, and that the Gentiles were coming from the east and the west to sit down in his kingdom. It was far more probable, she said, that the gift of tongues would be conferred upon his redeemed, as was done at the Pentecost spoken

of in the Acts. As for myself I have never cared for or concerned myself in these speculations, ever feeling that the language we shall speak in those high countries is of little moment so long as we sojourn here, and that our intellects should be exercised chiefly in striving so to live that when the time comes for us to take our departure thence we may do so with rejoicing and enter in with gladness.

So, as I said, I spake to the ghost in my own tongue, and the soft-falling footsteps passed over the space between the door and the hearth and ceased beside the chair.

I sat down in my own chair and took up my knitting. I have been in many singular as well as startling circumstances during my long and eventful life, but in none so strange as this. Before me stood the great old chair, empty to all appearance and void. But I knew that from its ghostly eyes were regarding me. What should I say? How was I to talk to empty space, with neither answering eye nor listening ear?

As I went on narrowing the heel of my stocking I revolved and cast about these questions in my mind. And then I remembered that this was the ghost of a young girl of nearly my own age. I do not know whether ghosts count their age by years, or whether they grow old at all in the sense that we do, or merely exist in that eternity which we are taught has no beginning nor end, and therefore no space such as we call time. I did not and do not attempt to solve these questions; for it has ever been my belief that it is not well to try with too great persistence to penetrate mysteries hidden from us for some all-wise purpose.

But my predominant desire was to console; and though I had not then met with my own beloved Richard, whose death in the very prime of his days has cast a shadow along the whole course of my life which will fade only into the light of that eternal day into which I am soon to enter, having very nearly lived out my appointed time, and which has taught me that love hath its anguish as well as its bliss, I reflected that she was only an undisciplined girl when she committed the sad deed of taking her own life, and that it might perchance soothe her restless spirit to know that another girl felt for her, and could in some measure comprehend what her feelings must have been when she recalled to her mind, after her lover's sudden and violent death, her disbelief in his integrity and the bitter letter she had written him.

So I told her that I knew her story, and how much I pitied her, and how I felt that the Infinite Goodness must pity her much more, knowing so much better than I her sorrow and her provocation, though she had been con-

demned thus to wander and to live over nightly for so many years that scene of violence. And I told her that I would ask the Infinite Goodness to give her rest, feeling I could do so, justly yet humbly, since the divine example of our Lord, who, his apostle tells us, preached to the spirits in prison, even the unrepentant dead.

As I finished speaking, the nightly period of her wandering having expired, the footsteps passed out, the door, untouched by mortal fingers, swinging wide open upon its hinges.

The next night she came, and the next and the next. But I soon ceased talking to her, beyond the friendly welcome which I always gave her. For I was put to it for fit subjects of conversation, feeling that her interests could not be of that earthly nature that such subjects as the weather, which we human beings in the flesh find so inexhaustible, could be of interest, since to a disembodied spirit heat and cold, storm and sunshine, must be alike indifferent.

But having through Miss Silence's example and teaching, and my own inherited taste, a great love of reading, and always having found it a never-failing spring of comfort amid adverse circumstances, I resolved to read to her: and this I did night after night—wise sayings of the great and good Dr. Johnson (for I feel that he deserves these epithets, despite his hotly expressed condemnation of the attitude of our States during our late severe but triumphant struggle with the mother country); Mr. Milton's "*L'Allegro*," which I chose as more enlivening than his "*Il Penseroso*," as also his sonnet concerning his dead wife who came back to him like *Alcestis* from the grave; well-polished similes like sparkling and radiant gems from my beloved *Jeremy Taylor*; and the wisdom that exudes like the first droppings of the honeycomb from the pages of the saintly *Leighton*.

I read to her also from the works of the godly Mr. Baxter, more especially those parts wherein he discourseth so sweetly concerning the rest that remaineth, nor did I pass by Mr. Bunyan's fight with *Apollyon* in the "*Pilgrim's Progress*," which, I reflected, might give her strength too, were she struggling with an evil power. But I did pass by in all these writers their profound theological disquisitions and speculations, which I have ever found difficult of digestion by my weak, illogical, woman's intellect, and which have always seemed to me, of lofty and wonderful proportions though they be, as something altogether separate from saving faith, and ill suited for the binding up of a wounded spirit.

I also read to her some pages of Dr. Swift's letters to *Stella*, which to some might seem a

singular choice, but which are so filled and penetrated by the tender spirit of love, I could but think they would sound like breathings of heavenly music even to ghostly ears.

Of my Shakspeare, however, I read but little, ever having been of the opinion that he is not to be taken in detached sips, a taste here and a taste there, as from a cup that hath a bottom, but in long, deep draughts, as a thirsty man drinks from a pellucid and never-failing spring. So I read to her only those sonnets of my Shakspeare wherein he speaks so wisely and understandingly of love—the theme methought best suited to a spirit's hearing.

I read to her too from the sacred and holy Book, fit for all ears, whether spiritual or natural, the divine sayings of our blessed Lord, which of a surety must bring comfort to the most despairing soul in the extremest limits of his universe.

For thirteen nights she came thus, but on the fourteenth it was borne in upon me that my ghostly friend was about to depart never more to return. For I had come to regard her as a friend, listening for her nightly footsteps as for those of one well beloved and much desired. I told her this, and of my sorrow at her approaching departure, though I could but rejoice, as must she, that her wanderings were to end. I further said that I had a great and engrossing desire to look upon her with my natural eyes. And since she had the power to make her presence known by the soft-falling footsteps, could she not by a still greater exercise of that power permit me to behold the body wherein she dwelt, the shape a spirit takes on when released from the bondage of the natural body?

I then paused, with my eyes fixed attentively upon the chair wherein she sat. Soon I perceived something like a mantle of the finest gauze, more perhaps like unto the dew-filled webs of a summer's morning, lying upon the chair. The shadowy yet shining folds thereof fell over the arms, touching the floor here and there as does a maiden's gown when she sits. It was mist, and yet it was not mist. We are wont to consider the haze that hangs in the atmosphere on an early day in spring, or that clings around the tops of distant hills, a most delicate and ethereal substance. But this was still more delicate and elusive. It was more like the spirit that dwells in that mist than the mist itself. My pen struggles to convey to you, my daughter, any adequate idea of this that I saw. Pen and words are impotent to do so. And as the soft-falling footsteps receded it melted into nothingness and was gone.

The next night I again expressed the same desire; and I said that now, my natural vision having been able to grasp that shadowy out-

line, perhaps it might be vouchsafed me to see her in still more tangible shape. And I entertained her, if it were in her power, thus to manifest herself to me.

Having thus spake I waited, and again the shining, shadowy folds of mist fell over the chair. Slowly they took shape—a shape like to that of the human body, but with outlines of more surpassing grace. The hands were held in a gentle clasp of rest and repose. The shape of the throat was there, with tender shadows lying under the curve of the chin, and something like fine threads of hair fell away from a rounded outline of brow. And from under the rounded outline of brow the eyes looked forth, truly the most astonishing a human being was ever permitted to gaze into, large, pure, and unfathomable, within their depths dwelt peace—peace unutterable; and love—love unquenchable.

Long I gazed, until the vision faded and the soft-falling footsteps receded and I was left alone, though I fain would have followed, charmed out of myself and from all desire of remaining by the power of those most beautiful and holy eyes.

But the ability to follow seemed to be denied me, and I sat by the dead embers far into the night, as one bereft and alone. So I continued to feel as the days passed and the nights came and went and my young kinswoman returned no more. But as I reflected in these hours of my loneliness on all that had passed, and how through the Divine Goodness it had been vouchsafed me to lead her perturbed spirit away from this scene of her sin and sorrow, even as I reflected a great peace and content fell upon me as of a parting benediction, and took possession of all my days and ruled my nights.

Frank Pope Humphrey.

THE EPITAPH.

“Here lies one whose name was writ in water.”

IN water, yes: the water of a stream
 Not wide nor long, but, deep as it might be,
 That hurried all too swiftly to the sea.
 And yet whole generations dream their dream
 And sleep and are forgotten while the gleam
 Of his bright fame shines on resplendently,
 And all men know his name and poesy.
 We write our names in sand and idly deem
 The shore more lasting than the lapsing wave;—
 Fast fares our little day in cloud and sun
 Till at our feet the quick tide-ripples lave
 And whelm us and our records one by one.
 His name the sea took up and proudly bore
 And wrote it in white spray on every shore.

J. T. McKay.

BEREAVED.

LET me come in where you sit weeping—aye,
 Let me, who have not any child to die,
 Weep with you for the little one whose love
 I have known nothing of.

The little arms that slowly, slowly loosed
 Their pressure round your neck—the hands you used
 To kiss. Such arms, such hands I never knew,
 May I not weep with you?

Fain would I be of service—say some thing
 Between the tears that would be comforting,
 But ah! so sadder than yourselves am I,
 Who have no child to die.

James Whitcomb Riley.

The
Nieuwe
Amsterdam

A Legend of Old New York

GEORGE MARION EDWARDS - INV.

VER two hundred years ago where the great city of New York now stands there stood the town of Nieuw Amsterdam, and Peter Stuyvesant of blessed and hard-headed memory was governor: peace to him!

In those days there were no elevated roads, no crowded tenement-houses, no deadly spider-webs of electric wires overhead; nor were there stone-paved squares where on summer nights the poor swarm out to gasp a little of God's free air. Instead there was a market-place with a town-pump, flanked by queer Dutch houses with dazzling brass knockers against the green front doors. Cows grazed on Wall street, and the good citizens strolled along the Battery of an evening and watched the setting sun. Bedloe's Island was a nameless thing, and only the ghost of a mighty bridge connected what was neither New York nor Brooklyn; while not even the shadow of a coming great merchant navy troubled the quiet waters of the bay.

The Battery of those old days was overgrown with grass and young clover, and shaded by spreading elms and sycamores, beneath which the children played and made posies of dandelion blossoms.

A lane of curious gabled houses with red-tiled roofs fringed the outskirts of the Battery facing the sea. On one side stood "De Blauwe

Druif" (The Blue Grape), a tavern famous for its *poetterjes* and *wafelen*, Dutch delicacies as celebrated as the victories of Admiral de Ruyter. On the long benches beside the porch the good fathers of the town smoked their long clay pipes, meditating about nothing in particular, while the young folks danced to the tooting of Kristoffel Sauer's trumpet. Officially Kristoffel was town trumpeter and town crier, but in his private capacity he was ever ready to set the feet of young Amsterdam skipping. Those were dances indeed, with a vigorous lifting of sturdy feet, a clutching of red hands, and a lack of breath, such as we never see in these degenerate days. Exhilarating were Kristoffel's strains, and delicious were the crisp *poetterjes* and the sweet cider with which the gallant swains revived the exhausting energies of the fair juffrouws while the summer breeze swept up from the bay and lightly swayed the trees, tempering the heat of the fiery sun.

There was no tur-

KRISTOFFEL.

moil of ships in the harbor as in these days, and it was a six months' wonder when a Dutch brig as broad as she was long rolled into the bay and cast anchor. It gave the good mynheers inexhaustible food for reflection as they smoked their pipes before De Blauwe Druif and stared sleepily into the sunset.

Even old Governor Stuyvesant lightened the cares of government occasionally by stumping down from the Town Hall on the market-

the story of Daniel in the lions' den in chilly Delft tiles about the chimney. Over it hung a time-dulled oil painting, "The Martyrdom of St. Nepomuk," which made the sturdy table bearing up under the weight of Juffrouw van Twist's choicest dishes more comforting by contrast. Beside Mistress van Twist's chair stood the burnished brass "warm-stoof" over whose charcoal embers a copper kettle sang a pleasant accompaniment to existence, so that

"DE BLAUWE DRUIF."

place to the Battery for a sniff of sea air, and it was his privilege to pat the cheeks of the prettiest juffrouws with a condescending forefinger. There was nothing in this attention to excite gossip, though it was faintly whispered if Mevrouw Stuyvesant were no more,—and she was very lively,—and old Peter were fifty years younger, then would young Mistress Van Witt have the best chance to be in her turn Dame Stuyvesant. But then Juffrouw Van Witt! What man, governor or not, could resist stroking a cheek like a peach blossom, when it may be said to have been a perquisite of his exalted station. There were certain heavy young mynheers who would joyfully have taken his place without his salary for the chance. But they were very shy of words, and their adoration took the form of steady pilgrimages to Mynheer Van Witt's mansion, "Bovenkirk," just beyond Governor Stuyvesant's "Bowery."

Here of an afternoon they would find Wimpje Van Witt sitting by a window in the great living-room and spinning vigorously, adding to the treasures of fine linen, the glory of a Dutch maiden's dowry. At another window sat Juffrouw van Twist, and if there was a chill in the air a blazing fire on the hearth warmed

a dash of boiling water was ever ready for a bumper of grog or a dish of that precious new herb drink called tea.

In the coziest corner of the chimney, in a mighty leather arm-chair sacred to his use, reposed Cornelis Van Witt, burmeister or alderman of Nieuw Amsterdam, chosen as such by Governor Stuyvesant for the curious merit in a legislator of being always asleep. Thus in assembling his council old Peter was always certain of one loyal, uncontradictory adherent, sound asleep in his high-backed chair, his pipe-stem firmly clutched between his teeth; and this slumbering legislator was always acknowledged as being on the side of his Excellency.

Though Mynheer Van Witt wore six pairs of breeches and as many waistcoats, and as burmeister he represented the dignity of the town, it must be acknowledged that he had two mortal terrors—ghosts and Englishmen. He had been brought up with a ghost, so to speak, for there was a haunted graveyard only separated from his threshold by a spreading field and the public highway. It was Tante Jantje, the old darky nurse, who had educated him to a gruesome terror of that ancient Church of St. Bartholomew and the graveyard beside it.

Tradition had it that many years before a

THE MAD SEXTON'S WORK.

crack-brained sexton in a fit of madness took up all the headstones in the silent place and planted them in straight rows in another part of the cemetery, whereupon he razed the quiet mounds and departed from the sight of men, leaving the result as a ghastly surprise to the worthy burghers, who, curiously enough, left the stones standing in their straight, sad rows. But that which really appalled Mynheer was that the figure of the mad sexton in trailing white draperies had been seen by creditable witnesses at midnight gliding from stone to stone and wringing its hands in evident remorse, thus publicly acknowledging its repentance. As Mynheer had retired to his couch at nine o'clock for fifty years, and as the ghost appeared at midnight, it is needless to say that he had not personally encountered the apparition. Having, however, in the usual way of life as much imagination as a herring, in this Mynheer was as adamant, and he had constructed for himself a scene of nightly horror in which he firmly believed. On waking at night from a heavy sleep evolved out of sauerkraut, sausages, and cider, lightly topped off with a mountain of crisp waffles, he would turn pale

MYNHEER AWAKES.

to the end of his red bottle-nose on hearing a vivacious rat scamper behind the wainscoting. Nothing in the world would have induced him to pass the kirkyard of St. Bartholomew at midnight, though he stood high in the esteem of the sacred establishment by reason of a ponderous silver communion service straight from Amsterdam which had already excited the righteous longing of every rascal in town.

Mynheer's abhorrence of the British nation was purely patriotic. Great was his agitation when the belated tidings of the victories of the Dutch navy reached Nieuw Amsterdam. Mynheer was always a little behind time in everything, and this Juffrouw van Twist was obliged to acknowledge—she who had been waiting for eighteen years, since the death of Mevrouw, for Mynheer to propose. But he was a man of few and slow words, and he had so far been deterred either because it was time for one of the five daily meals,—and to allow a dish to grow cold in the waiting was a crime,—or that he had fallen asleep; so that a match which the town declared to be eminently fitting, and to which young Wimpje gave her cheerful consent, was delayed because Mynheer was always a trifle behind time.

THE MAD SEXTON.

Thus from being a moderately young thing, sandy, and sharp of elbows, bony of ankles, and with colorless hair crowned by a stiff muslin cap, Juffrouw van Twist grew elderly and thinner with all the other advantages unchanged, but with a heroic determination to marry Mynheer Van Witt sooner or later. If it be added that Mistress van Twist was not without a touch of romance, and that it was she who educated Wimpje Van Witt, it will surprise no one to hear that young Wimpje had day dreams enlivened by slimmer and more poetic figures than those silent young mynheers who trundled out to Bovenkirk of an afternoon. Had these speechless admirers of Mynheer's broad fields and ducats only known, perhaps they would occasionally have uttered a word. As no one ever spoke, it was manifest that the next best token of love was an abnormal staying power, and when it came to

POWTJE.

that it was admitted that of all the beaus of Nieuw Amsterdam Jan Wissenkerke had the greatest chance.

II.

THOUGH Governor Stuyvesant had appointed Cornelis Van Witt to his high office for the original merit of being always asleep, there came a day when Mynheer for the first time wished he had been awake.

It was a Friday, a miserable, unlucky day, as every one knows. A chilly spring day, and the grass was sprouting among the cobblestones of the market-place. Governor Stuyvesant greeted his assembled council in full uniform and with a portentous frown, and at the end of a stormy meeting—in which he did all the storming—he gave such a thump to the table that Mynheer Van Witt awoke gasping and was with difficulty made to understand that something awful had happened. It seems that from private information the governor was warned that Great Britain was hungering for the Dutch possessions in America, and his Excellency was entreated to defend the colonies to the bitter end in case of an invasion.

The burmeisters' faces grew as long as their clay pipes and fully as white, and they answered with energetic silence his heroic appeal for support in case of necessity, and when it came to a vote it was found that only hard-headed old Peter and the gently slumbering Cornelis Van Witt were for a defense to the death.

This heroic, if unuttered, resolution being after vast difficulty imparted to Mynheer, that

brave man staggered down the narrow stairs to the street with dazed eyes and his knees quivering under the six pairs of breeches.

Such was the perturbation of his heroic soul that he ran against one of the stone posts before the Town Hall, and would have measured his breadth—as being of more importance than his length—on the unfeeling cobble-stones had not a grip in the rear saved him.

"Home, take me home," Mynheer gasped, and clutched the air for support.

"By all means, Mynheer; but where?"

The unhappy man took his gaze out of the future and fastened it upon his rescuer.

The apparition could not inspire confidence in the ordinary ways of life—a seedy Colossus of Rhodes, familiar and hilarious, his forefinger resting with impertinent jocularly against the side of a very red nose.

"Too deep a glance into the eyes of the fair Ginevra, eh, Mynheer?" he remarked with shocking familiarity.

Mynheer was in no condition to resist this allusion to the national beverage, for he was fighting the entire British nation. He leaned against the stone post and said, "Bring Powtje."

Powtje was a fat cob harnessed to a chariot. At this moment he was eating his head off in a shed behind the Town Hall. The accommodating stranger eyed Powtje's fat sides with disfavor.

"You beast swelling on the fat of the land while a poor gentleman can't earn a dishonest meal, leaving out of question an honest."

The chariot was a simple box on four wheels without springs, and it may be considered a dispensation of Providence that Powtje should decline to do anything but walk.

Mynheer climbed in and was in danger of forgetting the obliging stranger, who thereupon patted Powtje's flanks with sudden enthusiasm.

"A beautiful creature, Mynheer; a veritable Arab steed."

"To be sure. I'd forgotten you. You've been of service to me. Come home with me and you shall have a good supper. I am Cornelis Van Witt of Bovenkirk."

After much coaxing Powtje decided to lift his Arab legs and crawl along, and thus did

Abraham Baas, commonly called Bram Baas, and in moments of tenderness "Brammatje," make the acquaintance of Mynheer, who sat beside him a victim to an active imagination which pictured to him the horrors of war—his fertile fields laid waste, his well-filled pockets emptied by friend and foe, his dear child Wilhelmina without protection, and himself an expiring example of unwilling valor.

"Have you heard," he blurted out at last, "that the British are coming?"

Brammatje awoke from the contemplation of a flock of geese taking an afternoon stroll and rapidly leaving Powtje behind.

"Let 'em come," he declared boldly, and slapped his threadbare doublet until the dust rose in clouds. "We'll be ready for 'em. I've seen 'em in Boston, a lean and lank lot whom a pottle of good Schiedam schnapps tips under the table. Let 'em come and crack a blunderbuss with us, I say."

"You are not afraid," Mynheer cried in undisguised admiration; and a vague idea took possession of him that it would be well to have so valorous a soul always about as a body-guard for an evil day.

Thus it was that Brammatje entered Mynheer's service, not so much because he was asked as that he declined to leave. His worldly possessions consisted of a rusty sword, a blunderbuss, a jug of true Holland gin, and a brass trumpet. In return for his sustenance he gave Mynheer the comforting assurance of his moral support in case of British invasion.

BRAMMATJE.

III.

THE first Mynheer Van Witt had chosen the location of his domain, after a certain trifling pecuniary transaction with the untutored savage, in fond remembrance of the marshes about his own beloved Amsterdam. Mynheer abhorred mountains; give him something flat, green, and damp and he was content. He also constructed a canal behind his back

door, which was speedily covered with an aromatic green growth the smell of which positively made him homesick. He built himself a windmill, and at sight of the slowly turning sails his soul found some repose. It may be added that having one day by accident discovered beyond his broad fields a glimpse of the distant hills of the Hudson, he had a high wooden wall and a barn built to hide from his afflicted vision so obnoxious a sight. His son Cornelis inherited these along with his father's domain, his waistcoats, his breeches, and all his prejudices.

The day Cornelis Van Witt defied the British lion Wimpje Van Witt sat at the kitchen window mending the household linen. Beside her in speechless ecstasy sat Jan Wissenkerke watching a buxom ducky in a scarlet turban frying poffertjes. The kitchen walls were covered with a precious array of brass pots and pans, waffle-irons, poffertje pans; and overhead the heavy rafters were garlanded with strings of onions and garlic, while in the choicest nooks hung the smoked hams and sides of bacon. Beside the kitchen table Mistress van Twist was preparing a roast of young pork, and with the exception, perhaps, of Wimpje there was nothing Jan Wissenkerke loved quite so much. The situation was too much for him; he turned and uttered these passionate words:

"When I marry, Juffrouw Wimpje, and am master in my own house, I shall eat pork and poffertjes every day—I love 'em."

It was saying a good deal for young Wimpje's charms that she could hold her own in Mynheer's estimation under these circumstances. There is a picture of her, a slim young thing, yet with a suggestion of dimpling roundness, a sunny face framed by a tangle of short gold-brown curls held in place by a coquettish little saucy white muslin cap. A gray homespun skirt, a red-laced bodice, and about her pretty shoulders a great ruffled kerchief tied in a knot at her breast. If it be added that the gray petticoat was properly short, so as to display the neatest of red stockings and a high-heeled shoe with a silver buckle, it will still be difficult to give to any one a proper idea of young Wimpje Van Witt.

At Mynheer Wissenkerke's words the upward tilt which Heaven had been pleased to bestow on Mistress Van Witt's small nose seemed to be accentuated; but before she could utter a word the door was flung open and Mynheer Van Witt sank exhausted into the nearest chair, and it was only after several pulls out of a high-shouldered black jug that the good man revived. There was a discreet cough heard, and Brammatje Baas was discovered lingering on the threshold.

"Give the man a drink," Mynheer murmured brokenly.

"Why, father, what has happened?"

"These are terrible times, Wilhelmina," and Mynheer shuddered. "Invasion threatens the land—the British are coming. But it behooves us—to—to be brave. We'll all die together."

Here Jan Wissenkerke's legs shook so pitifully that he sat down, while Brammatje joyfully sniffed the aroma of the frying *poftertjes*.

"Who is that man, father?" Wimpje asked with strong disfavor.

Mynheer replied with elaborate caution: "A man of valor, child, whom it were well to befriend if the British are coming. It will be pleasant to have a grateful soul who will be willing to be killed in our defense."

They all turned to look over their shoulders at this prospective martyr to gratitude.

"At any rate count the spoons first," Juffrouw van Twist said with a sniff.

"Jan, we depend on you," Mynheer continued tremulously. "A Wissenkerke never yields."

No description could do justice to the want of enthusiasm with which young Wissenkerke answered this appeal. Even Mynheer's moving description of the death of a hero had such a discouraging effect on him that he presently vanished, forgetful of love and roast pork.

Though there were no further rumors of British invasion, Brammatje remained. Like all standing armies he did not toil, but he devoted his energies to attacking five square meals a day and making perceptible havoc on the cider and gin. He was highly unpopular, but Mynheer proposed to make a rampart of his well-fed body, and before long his wisdom was triumphantly vindicated.

It was a soft summer night, dark in spite of countless brilliant stars. The Hudson flowed softly along its Palisades and in the bay the tide beat against the Battery, flanked and protected by a straggling old wooden fort where a couple of infant cannon pointed through two rusty peepholes at nothing in particular. The solitary sentry, convinced that watching over the safety of his country was a farce, was

sleeping peacefully with his chin on the muzzle of his blunderbuss, and thus it happened that of all the good souls in the colony this summer midnight Brammatje Baas was alone awake, and it was he who tumbled up the stairs to Mynheer's bedchamber and thumped loudly against the stout door panels.

"We are attacked! The British have come! Wake up, Mynheer—hear 'em. They're around by the barn—the wall'll be down next!"

A faint voice replied out of a valley of feathers: "Defend us, Brammatje! God be with you"; whereupon

Mynheer pulled his nightcap over his ears and melted with cold perspiration, for what with the British in the rear and his ghost in front it was more than he could bear.

The rest of the household, roused by the turmoil, each and all double-locked themselves in, generously refusing to snatch a single one of the laurels Brammatje Baas was destined to earn.

The noise was frightful, and though Mynheer tried not to hear, the heroic Brammatje's voice was plainly audible, roaring and swearing; and such was his valor that the charge of this one brave soul prevailed, the stampede grew fainter and fainter, and at last, with a sigh of relief and a pleasing appreciation of his own wisdom in the

choice of a champion, Mynheer turned about in his feathers and fell fast asleep.

The next morning a scene of perplexing devastation was discovered. The wooden wall erected by the first Mynheer Van Witt, and which now served as shelter to the kitchen garden as well as prop to a number of peach and pear trees, lay in ruins, crushed through and trampled down by the—Van Witt cows, which, yielding to an access of hilarity, had broken down the decaying wood and feasted with great gusto on those tender young vegetables the growth of which Mynheer had watched with fond solicitude. This was the midnight raid, and it was instructive to see the rapidity with which Brammatje was stripped of his sprouting laurels. The very darkies mopped up the floor under his heroic eyes, and Mistress van Twist locked up the gin before his nose.

WIMPJE.

But Mynheer was true to him. "It was not his fault that there were only cows," he urged feebly.

"No wonder he saw the British, Mynheer; I counted the empty gin bottles. He might have seen the very devil."

But Mynheer was not to be convinced; his follower had been ready for the enemy, and it was not his fault that the enemy did not come. So Brammatje rose like a sky-rocket in Mynheer's esteem by reason of his heroic conduct.

IV.

How the Columbus World's Fair that New York was going to have would have scorned its modest ancestor of two hundred years ago—the Kermess of Nieuw Amsterdam. In those days the market-place afforded ample room for the rude wooden booths built in narrow lanes and containing all manner of ware to tempt folks, from the governor down to the Indians creeping about in fatal proximity to fire-water. On one side stood the Town Hall, and opposite was the Dutch Reformed Church, and in between were the dwelling-houses opening on the cobble-stones and decked with flags and banners and evergreens. All the town, and even the folks from the outlying villages on the Hudson, crowded the narrow lanes. There were poffertje and waffle booths, booths for gin, cider, and Schiedam schnapps, pipes and tobacco, calico and glass beads, household ware and toys; in fact there was nothing the modest fancy of two hundred years ago could wish for that could not be procured. There was even a dance booth, towards which the exhilarating strains of Kristoffel Sauer's trumpet lured the juffrouws. A most delightful place to twirl about in if you kept clear of the posts. The sides were open to the summer air, and there were tables at which the exhausted could recruit their strength. At the table of honor sat Juffrouw van Twist shining with reflected glory, for Wimpje was certainly the belle of the occasion. Juffrouw van Twist's eyes were secretly fixed on the next table where sat a lithe and tall young stranger, who followed young Wimpje's evolutions in a country dance with smiling sympathy. He even bent forward to catch a glimpse of her slim form when a post, or the broader charms of some other damsel, hid her from view. Juffrouw van Twist rejoiced, for she had a grievance against man by reason of the belated declaration of Mynheer Van Witt.

Strangers were common enough in the town these kermess days, but this one was altogether different from the ordinary variety. The architecture of the young mynheers running mostly to breadth, the stranger was prominent as being of the long, broad-shouldered kind. He had

a handsome, frank face too, with a brown mustache with an upward curl at the ends that suggested adventure to Mistress van Twist. His knee-breeches and well-fitting doublet were black and in pleasing contrast to the gray of his stockings, his broad silk sash, and the wide-

JACK.

brimmed beaver hat that lay on the table; and as a good Dutch housewife she noted how fine was the linen of his broad cuffs and collar.

It was Jan Wissenkerke who led Wimpje back red as a June rose and pouting, for with fatal accuracy he had wrecked on a post.

There must have been some magnetism in the gaze of the handsome stranger, for Wimpje looked up shyly and met his admiring glance, and with an involuntary smile her eyes sank before his. How it happened no one could quite tell, but the next moment the stranger stepped forward and gallantly begged Juffrouw Van Witt for the favor of the next reel.

Nieuw Amsterdam was aghast, but Wimpje rose, shook her fair head and homespun petticoats in defiance, and lifted her pretty feet with renewed ardor to the tune of Kristoffel's most pleasing strain. Well might Nieuw Amsterdam stare; not even the posts were obstacles to this agile stranger. Neither did he grow red nor lose his breath; nay, when Kristoffel finished with a hilarious flourish, then did this obnoxious stranger stoop and kiss young Wimpje's hand in the very face of Nieuw Amsterdam, and lead her blushing furiously to Mistress van Twist, who acknowledged with a tender sigh that he was the belated realization of her youthful dreams.

Who was he and what did he want, Nieuw Amsterdam demanded. It transpired that his name was Cawardine—Captain Jack Cawardine; that he was staying at The Blue Grape; and, to explain his universal disfavor, that he came from Boston. By which it will be seen that the peculiar sentiments existing between two famous American cities are of ancient date. An Englishman from Boston

A BRITISH INVASION.

GEORGE WILKINSON EDWARDS

was a combination of unpleasant characteristics not to be pardoned. Some experienced old burghers doubted if so much agility and cheerfulness could hail from a town famous only for the crookedness of its streets, the hanging of witches, the length of its sermons, and a certain unwholesome dish called pork and beans.

What Captain Cawardine wanted was plain to all Nieuw Amsterdam. It was a new way to lay siege to a peaceful colony by marrying its richest heiress. It would be a municipal misfortune should Mynheer Van Witt's great fortune leave the land; so it was no wonder that all Nieuw Amsterdam shuddered when Captain Cawardine kissed the hand of Juffrouw Wimpje Van Witt, who—yes, who blushed and smiled.

v.

How describe the speechless amazement of the town when the rumor spread like wildfire that Captain Cawardine was courting Mistress Pamplona van Twist; but the most amazed was Cornelis Van Witt. He had just prepared to take his afternoon nap under the protection of St. Nepomuk when Pampy van Twist looked in and demanded:

"Are you asleep, Mynheer?"

"Blicksem! Asleep when I am being talked to death!"

"I—I—have something to say to you"; and she looked at St. Nepomuk as if for support.

Mynheer was in undisguised consternation.

"Mynheer Van Witt," she began, coughed and paused; then there was such a terrible silence that a bumblebee straying in at the window where Wimpje was spinning filled the air with its droning and flew out again.

"Mynheer Van Witt, I am going to get married."

Here Wimpje's spinning-wheel fell with a furious clatter.

"Blicksem!" Mynheer cried, and was speechless. Then he gathered his faculties together. "Juffrouw van Twist, are you—I—I—" He paused again and leaned forward. "Married? Did you say married? Blicksem, Juffrouw! When did I ask you to marry me?"

"You!" And out burst the suppressed resentment of eighteen years. "Not you, thanks be to gracious!"

"You don't say there is another, Juffrouw?"

"I should hope so," she retorted in triumph.

"Well, he waited long enough."

"Therefore he is so much the younger, Mynheer."

"A lucky man"; and Mynheer tried to be polite, but he broke down. "Who the devil is the fool, and what are you pestering me for?"

"A very likely young man, well to do, and without gout, Mynheer."

Mynheer winced. "A nice young fellow to marry an old woman like you?"

"If he is satisfied, that is enough. All I want Mynheer to know is that the young man is coming here—ahem!—courting."

"Courting!" Here Mynheer leaped to his feet and tore up and down the room. "Courting—I won't have it!"

"Perhaps, then, you will kindly look out for another housekeeper." Mistress van Twist appeared resigned.

Mynheer paused before her and stamped with his feet.

"Donder and blicksem! I'd rather have married you myself."

"May the young man come?" Mistress van Twist's composure was unruffled.

Mynheer stared, gasped, clenched his fists, and spoke. "Tell him to come, or go to the devil"; whereupon he retreated.

Juffrouw van Twist watched him in deep meditation, when she uttered these remarkable words: "Wimpje, child, if we had only known how to go to work, I could have married your dear father eighteen years ago."

Mynheer retired to his favorite haunt, a Chinese pagoda on the canal, and tried to collect himself. This was truly a day of horrors. It began early that morning when Brammatje announced that, as he was a sober Christian, he had himself seen the ghost of the mad sexton just as the bell of St. Bartholomew struck midnight.

Mynheer thought of the apparition and shuddered, and he thought of Juffrouw van Twist and swore. How serene had been his existence these eighteen years, and how divinely she stuffed roast goose with chestnuts. Her poffertjes were always the lightest, her waffles the crispest, and in the contemplation of her cider he smacked his lips feebly, while at the remembrance of a certain kind of rich cake of which she alone knew the divine art Mynheer began to be unspeakably moved. Were not his slippers always toasting on the hearth, and on winter nights the chill was always taken off the sheets. Yes; Pamplona van Twist was fully revenged for the silence of eighteen years. And now all these tender attentions, these beautiful accomplishments, were to be devoted to a rascal who probably did not appreciate his blessings; and when it seemed as if his cup of bitterness was full who should appear but Brammatje, and the valiant man's voice quavered as he spoke.

"Mynheer, the English have come, sure; there's one in the house!"

"Heeremijntid!" moaned Mynheer, and crept unwillingly back, while Brammatje wisely

retired into the inner sanctuary of the woodshed.

A great sirloin of beef was roasting merrily over the kitchen fire as Mynheer passed. He paused at the door of the living-room with his hand on the knob. He heard voices, laughter, scuffling; in fact levity was out of place in these terrible times. On the other side of the door beside a small table sat Mistress van Twist in her holiday best, a cap of delicate Brussels lace on her head and her feet on a brass warm-stoof, reading out of a holiday book with a satisfied smile on her face. On the other side of the table sat Wimpje playing with a red rose and looking smilingly through its green leaves at the enemy.

"Mejuffrouw," the enemy pleaded; "give me the rose."

At this moment ponderous steps were heard approaching, and Wimpje with a startled blush drew back the hand which had found its way into the enemy's possession. The rose fell to the ground, both stooped to pick it up, and before Juffrouw Wimpje knew what had happened her head was on his breast, two dark eyes looked laughingly into hers, and two red lips so temptingly near his own were being — ah, why explain?

The next instant the door was flung open, and Juffrouw Wimpje, as red as the rose safely tucked in the enemy's gray silk sash, looked guiltily down at sight of her father. The enemy rose from the leather settle beside Juffrouw Van Witt, and Mynheer remarked that there was a jug of his best cider on the table.

"What — who?" Mynheer demanded with a quavering voice.

"Yes, Mynheer; the young man of whom I spoke," — and Mistress van Twist smoothed her best apron, — "Captain Cawardine."

"You seem to be a stranger here," he grunted.

"Yes, Mynheer."

"From where?"

"From Boston at present — an Englishman from Boston."

"I hate Boston and Englishmen," he added under his breath.

"So I hear, Mynheer"; and Captain Cawardine smiled gently.

"A nest of Puritan bigots and hypocrites. What are you doing here?"

"Courting a wife, as you may have heard, Mynheer."

"The more fool she," the old man roared, and retreated to his sacred chair and pretended to take a nap, though he raged under his scarlet handkerchief that rose and fell like an angry sea with Mynheer as a furious Dutch Neptune.

But Mynheer was not the only one, for

Brammatje sat on a woodpile in the shed and swore like a trooper.

"That hook-nosed Bostonian 'll bring you ill luck, Brammatje. He's seen you in Boston breaking stones on the highway with the rest of 'em, and all for the sake of that old mare. I know you, young sir, a king's officer fresh from England, famous at a sword thrust, a fandango, or a light ditty — they 'd hang another on the Common for less. I 've only to say 'British spy' to Mynheer and where 'll you be, curse you!" Brammatje shook his fist, lost his balance, tipped back, and the woodpile sank gently over him.

Juffrouw van Twist's courtship prospered slowly and steadily; Captain Cawardine was at Bovenkirk every hour of the day, and poor Mynheer Van Witt was experiencing symptoms of neglect. His slippers were forgotten, his sheets were chilly, and to add to his wretchedness the ghost of St. Bartholomew's had been encountered by several sober witnesses.

But as the proverbial worm turns at last, so did Mynheer, and he went in search of Juffrouw van Twist. He found her stirring batter in the pantry. From the solitary window there was a delicious view of the canal, the windmill, and the pagoda; this and the prospect of waffles moved Mynheer unspeakably.

"Juffrouw van Twist!"

"Mynheer Van Witt?" The fair Pamplona paused with uplifted ladle.

"Juffrouw van Twist, what have we done that you wish to leave us?"

"I — I — do not understand, Mynheer."

"What is there so captivating in that young man, Pamplona?"

"He is a very pleasing youth, Mynheer."

Mynheer sank into the chair beside the table and spoke with solemn politeness.

"Juffrouw, do not be offended, but how shall I put it to you? Shall I say he is too young for you, or that you are too — ahem! — say mature for him?"

"It comes to the same thing, Mynheer."

"Then why, blicksem! do you marry him?"

"Because — because it is high time for me to get settled. It may be my last chance, and the young man is willing. He likes me, Mynheer."

"So do others, Juffrouw van Twist"; and Mynheer leaned across the table and took the ladle out of her hand. "So do others, Juffrouw van Twist. Donder and blicksem, Juffrouw, I like you — marry me!"

"O Mynheer! why did n't you speak before?"

"Send him away, Pampy; send the youth away."

"O Mynheer! and break his heart. No, I

could n't—could n't"—here she reflected—"unless—"

"Unless what, Pampy?"

"Unless some one else could be found to take pity on him, and who would try to take my place."

"We'll find some one," Mynheer cried with enthusiasm; and not only seized the fair hand of Mistress van Twist, but he was about to embrace her waist with one arm when the pantry door burst open and Brammatje stepped in. "The English!" he roared, and vanished; and Mynheer followed, forgetful of love and waffles.

This time it was true. That very morning on awakening Nieuw Amsterdam was appalled by the spectacle of six English men-of-war anchored in the quiet bay, their guns pointed directly at De Blauwe Druif; and in the course of the day the English commander-in-chief, Colonel Matthew Borden, politely demanded of Governor Stuyvesant the surrender of the Dutch colonies in the name of his gracious Majesty Charles II. As further inducement, Colonel Borden added that if he refused it would be their painful duty to blow Nieuw Amsterdam into mincemeat. Whereupon the good burghers clamored enthusiastically to be surrendered. But old Peter Stuyvesant declined; he and that other patriot Cornelis Van Witt he declared to the deputation would teach their fellow-citizens to be patriotic.

VI.

MYNHEER overtook Brammatje. "The English will rob and ruin me," he groaned.

"Of course they will, and what they don't know he'll tell 'em."

"He—who?" Mynheer gasped.

"The British spy."

"Heereje! what—what do you mean?"

"That long-legged Englishman, Captain Cawardine; who else?"

"What—he—how—how do you know?"

"What's he doing if he ain't spying? Queer too that those big ships come into the harbor now, eh, Mynheer? He knows all about you and your ducats, and with six ships down there to back him all he's got to do is to say, 'Fork out, Cornelis Van Witt, or I'll—'"

"What, Brammatje, what?"

"How should I know? Only it won't be pleasant."

"Heereje! what shall I do?"

"Make him harmless; turn the tables."

"But how, my dear, excellent friend?"

"When he comes"—Brammatje spoke with appalling secrecy—"lure him into the garret, that's safest; lock him in and make terms with him through the keyhole. If he won't

give in I don't mind persuading him with my blunderbuss—through the door, of course."

"So, young man, you will spy on me at night, will you?" he reflected with natural resentment. "Well, two can play at that game. I'll be blanked if I want to see your long legs round by the churchyard at night any more. Grudge a poor man a trifle of luck, do you?"

Late that afternoon Captain Cawardine appeared; he looked preoccupied if not guilty. "I have something to say to you, Mynheer."

Mynheer grasped the arms of his chair. Did this British spy mean to murder him or take him prisoner?

"Mynheer, I want to warn you against a man I see about here, one Brammatje Baas. I have seen him in Boston; he is an escaped convict."

Mynheer's muscles relaxed; he received this information with admirable composure.

"I have no proof, Mynheer, only suspicions; but I am inclined to think he is planning a burglary."

"Pon my word, Captain, where?"

"The old church over the way."

"Well, then, young sir, why don't you stop him?" Mynheer retorted with unrepressed scorn.

"I can, if you will let me lodge in your house to-night."

Mynheer Van Witt himself conducted his guest to his room—a garret room, but sufficient in comfort for a contented mind; it was dismal and clean, and it rejoiced in a huge four-poster with green curtains.

There was about Mynheer the restlessness of a bad conscience. "Bolt yourself in, young man, and God rest you," he said; and when after two hours of sleep Captain Cawardine tried the door he found that he was locked in, for what reason he did not stop to consider. Given a garret window, Juffrouw van Twist's homespun sheets, the roof of a broad veranda below, the rest was a trifle for Jack Cawardine. He dropped like a cat, still holding one of Juffrouw Pampy's sheets in his hand.

"Now for a little fun," he thought with a twinkle in his eye; and flinging the sheet about his shoulders he grasped the ledge of the veranda and swung himself into the midst of the famous Van Witt dahlias, a flower of which Mynheer approved as being so orderly and so clean.

The bell of St. Bartholomew struck midnight. The pine trees cast black shadows across the old cemetery, and the weather-beaten headstones lay deep in the unmoist grass. It required courage even in a ghost to break such profound silence. Yet the vibration of the bell had hardly ceased when something white, tall, and shadowy appeared against the darkness

of the old church, crept along with flowing garments, its face hidden, but bearing in its hands a heavy burden; progress was slow over the long grass. Suddenly through the silence there rang a cry—a cry of abject terror. The moment was unique in supernatural history: the ghost itself was haunted; for before it, under the shadow of a pine tree, stood another apparition for all the world like itself.

"I have been waiting for you," an unearthly voice spoke; and at the words the first ghost dropped its burden and fell on its knees and shrieked.

"How dare you mock me, you wretch?" the other demanded, and pointed to the flowing draperies.

"Forgive—forgive," the miserable mummer gasped.

"Brammatje Baas," the merciless voice continued, "what are you hiding?"

"My—my little sup-supper," he whimpered.

"You lie! You've been robbing the church. The communion service is in that chest."

"Ow-ow-ow!" and Brammatje bowed his rascally head in terror to the ground and made a discovery: the ghost wore spurs, and who ever heard of a mad sexton with spurs?

"The devil!" he roared, and would have jumped to his feet only his head came in smart contact with the muzzle of a pistol.

"Run and I'll blow your brains out," said Captain Cawardine with a firm grip of Brammatje's collar. "Leave your plunder there, I'll see to it; now come."

Whereupon he trundled Brammatje to the damp sacristy, dumped him in, locked the heavy door with Brammatje's own false key, and left that valorous soul to the companionship of the dominie's surplice and his own wrecked hopes.

Who will describe the condition of Mynheer Van Witt on discovering the captain's flight?—his manner of retreat was marked by the wrecks of sheets and dahlias. Mynheer felt that he was now at the mercy of an implacable enemy. To add to his terror rumor declared that Nieuw Amsterdam would be bombarded if the governor and Cornelis Van Witt did not surrender. Threats were uttered as to what could be done to Cornelis Van Witt if he insisted on being heroic. Three times that day was he summoned to attend the town council, but he knew better. Venture in range of the British guns and Captain Cawardine—never!

There being nothing else to do, a deputation of the worthy aldermen waited on Mynheer to remonstrate with him on his warlike folly. He emerged from the woodshed, his heroism beautifully disguised.

"What is the use of being so heroic, Cor-

nelis Van Witt?" they asked. Mynheer shuddered. He heroic, and not even Brammatje to help him! The deputation declared that if they could convince Mynheer their cause was won, for it went without saying that Governor Stuyvesant could not alone make war on the British nation. An honorable surrender, leaving them in possession of their worldly goods, was a pleasing thing, they declared. They wisely proved that it makes no difference whether you live under a Dutch or an English flag if you have five meals a day.

The result is known to every boy who dog-eats a history-book in the schools of New York these days. The common sense of Nieuw Amsterdam gained the victory; Governor Stuyvesant gave way in a huff, and the British troops under Colonel Borden took possession of the town. The only apparent result of this bloodless victory was that in honor of his Majesty's brother, the Duke of York, Nieuw Amsterdam received the now famous name of New York.

VII.

THE evening after Brammatje's disappearance the sexton of St. Bartholomew's thumped the brass knocker against Mynheer's front door.

He had just rung the six o'clock bell, and he was all of a quiver.

"O Mynheer, Mynheer! a great misfortune has happened."

"Another?" Mynheer spoke with stunned resignation.

"Your communion service, of which we were so proud, is—is—"

"Blicksem! what?"

"Stolen."

"Stolen! What—d——?"

"Yes, Mynheer. I rang the six o'clock bell and went to the sacristy, as I always do, and just as I turned the key the door flew open; some one knocked me down,—see the bump on my head, Mynheer,—but I recognized the rogue: it was Brammatje; Mynheer's own Brammatje. I flew to the cupboard where the service is kept; the lock was broken and the silver chest gone."

Mynheer was left to his reflections, and they were not comforting. He had been the dupe of a rascal, by whose advice he had locked a blameless gentleman into his attic, leaving him no choice but to jump out of a garret window at the risk of breaking his neck. This same maligned gentleman was an English officer, who could make it very unpleasant for him in these days of British invasion. The communion service, which cost a small fortune, had disappeared. Juffrouw van Twist had been deprived of a bridegroom who was not yet definitely

replaced. Wimpje went about in tears, and Mistress Pamplona flavored his favorite dishes with gall and wormwood. No, Mynheer, it was your own bad conscience which produced this culinary phenomenon.

Mynheer was convinced that something terrible was going to happen in the forlorn hope that the expected never does happen. But it often does, especially if it is unpleasant, and this time it took the road to Bovenkirk, a musketeer on a brawny mare, with a command from Colonel Borden that Cornelis Van Witt should appear before him forthwith in the Town Hall of New York.

In this same Town Hall, in Governor Stuyvesant's own chair, sat Colonel Borden writing a letter and cursing liberally, for Colonel Borden was not as handy at a goose-quill as at a good stout sword.

"Pothooks and hangers, confound 'em! Where's Jack? Jack'll do 'em in no time. Here you, Cawardine!"

But no Captain Jack appeared. Here the colonel pulled a watch like a warming-pan out of his breeches pocket.

"Time for Jack's old man. Wants me to frighten the old chap a bit and make him mellow afterwards. Well, I'm willing."

Just then there was an awful scuffle at the outer door; it burst open, and in flew something ponderous followed by a musketeer, who drew himself up, saluted, and remarked with business-like composure:

"I've brought him, your Excellency. This is Cornelis Van Witt."

There was an awful silence, then Colonel Borden spoke.

"So you're the man who defied the British nation and refused to surrender these colonies to my gracious lord and master, Charles the Second, King of England!"

Mynheer stared at the colonel in silent horror. Why was he obliged to shoulder the entire heroism of Nieuw Amsterdam?

"The British nation"—here the colonel frowned majestically—"is not to be trifled with."

Mynheer grew so limp that he clutched at the nearest chair for support; it was the very chair in which he had once fallen asleep and awakened an unwilling hero.

"Mynheer, your conduct has been such that you have aroused the—aw—the suspicion and resentment of the English Government."

"Oh, your Excellency, if you only knew. I—really could n't help it."

"I have reason to believe that you are a dangerous person, sir, disguising your true character under an aspect of timidity."

Here Cornelis wrung his fat hands. "I'm only a peaceful citizen, your Excellency; and

I—I—yes, I love and respect the English nation."

"Then why, Mynheer," Colonel Borden demanded with singular abruptness—"then why did you lock a beloved and respected Englishman into your garret?" ("Confound it!" the colonel muttered aside. "Why does n't Jack come? I've talked out.") "A nice way to treat a guest, by Jupiter!" he said sternly.

Here Mynheer sank on his knees; all was known and he was lost.

"Pardon, your Excellency! I thought—I—I thought the young man was a British spy."

So, then, it was out. "A British spy!" the colonel roared. "Jack Cawardine, the son of my old friend General Cawardine, a British spy! I say, Jack, come out here, d'ye hear?" And sure enough Jack came into the room, none the worse for the tumble into Mynheer's dahlias.

"I say, Jack, the old Dutchman thought you were a British spy."

Jack magnanimously helped Mynheer to his feet and dusted him tenderly. "What made you suspect me, Mynheer. Who told you?"

Cornelis was silent, and then he stammered, "Brammatje Baas."

"Against whom I warned you. Mynheer, why do you believe the word of a ruffian instead of that of a gentleman?"

"Young sir, why does a gentleman jump out of a window at midnight?"

"Mynheer, since when does the host lock his guest into his room? But pardon me; I owe you an explanation, and I am ready to give it. I hope it will prove satisfactory."

With these words Captain Cawardine pulled something heavy from under the table; it was a huge box with a broken padlock. He flung the iron-bound lid back, and there, in all its glory, lay the communion service of St. Bartholomew's.

"This," the captain said modestly, "is my explanation. If I had not jumped out of the window I could not have restored the treasure of St. Bartholomew to its generous donor"; and Captain Cawardine bowed very low to Mynheer Van Witt.

Mynheer beamed with joy, and he grasped both of Jack's hands.

"I have done you a great wrong, Captain Cawardine. Forgive me."

Jack smiled, and then he spoke. "Tell me, Mynheer, why do you dislike me?"

Mynheer changed color, cleared his throat, and then he blurted out, "Why did you come courting Juffrouw van Twist, sir?"

Here Colonel Borden gave a great shout. "'Pon my soul, Jack, even in these wilds there's a woman at the bottom of it."

Mynheer paid no attention. "What do you, a young and handsome man, want with a woman old enough to be your mother?" he urged. "The fact is, I have been meaning to marry the lady myself one of these days."

"Zounds, Jack! If Mynheer is very anxious you might be induced to relinquish the older fair for one younger; eh, my boy?" Colonel Borden leaned back in the great chair and crossed his knees, and Jack blushed furiously.

"Let me put in my oar," the colonel continued jovially. "Sit down, Mynheer, and make yourself comfortable. His Majesty's government will always be glad to see Mynheer Van Witt at home in the council chamber of New York. So it seems the lady is a trifle mature for the boy, eh? But if you take her and leave our young friend with an aching heart, sure it will be your duty to supply her place."

Mynheer looked dazed.

Colonel Borden continued with some emphasis:

"It will be well for Cornelis Van Witt to be on good terms with the new government. As a man of wealth on good terms with the government you can aspire to great influence. As a Dutchman who obstinately refused to surrender you may be heroic, my good sir, but you will certainly be — unpopular."

Mynheer changed color and condemned his heroism.

"If, on the other hand, you can ally yourself with a good English family of undoubted loyalty, that will be a guarantee for your future patriotism. You understand, Mynheer?"

But Mynheer was all at sea.

"Listen," the colonel continued. "Here's a boy I love as my own," and he laid his hand on Cawardine's arm. "His people are the stanchest of good English folks, well to do and honorable, and all this he has inherited. You, Mynheer, are wealthy; you have a daughter —"

"Yes, Wilhelmina; a little maid with yellow hair and brown eyes," Mynheer murmured absently.

"Exchange!" the colonel roared, and thumped the table. "What do you say, Jack? A good idea and a new one; eh, old fellow?"

Captain Cawardine watched Mynheer with breathless eagerness. Mynheer's perplexity was something painful; he clutched his head, and his little gray eyes roved wildly about. "This is so very sudden — so — so unexpected," he stammered.

"Sir," the colonel interposed, "do not forget my warning: I speak to you not as a prisoner of war, as I might, but as a friend."

"I — I — thank your Excellency, — I — I am

deeply beholden to you, — but — you see, gentlemen, I must first speak to Wimpje — my little daughter Wimpje. It will be for Wimpje to decide."

"Tell her to sacrifice herself for your sake, Mynheer, do you hear? And, I say, take Captain Jack home with you. I don't trust you — you are a desperate character. You are the hero of New York these days, Mynheer. God be with you, gentlemen."

VIII.

It is pleasant to be on good terms with the government if one has favors to ask.

Mynheer rode beside the captain and pondered, and every moment he inclined more and more to the colonel's plan. As for its being an English government — mere prejudice; what had the Dutch government ever done for him?

Mynheer broke the silence. "It all depends on Wimpje and whether her heart inclines to you. Young maids are uncertain tricks these days. She's desperate woful since two days, and such matters as courting may come amiss. Such weeping and hanging round my neck when I left — why, blicksem! there they are running down the road to meet me. Why, Wimpje child, and Juffrouw van Twist, here am I safe back"; and he held out a fat hand to each, while Powtje stood still and took a nibble of grass. "Glad to see your old father again, Wimpje? There, I'd forgotten — the captain's come. Go on, Powtje."

Captain Cawardine swung himself out of his saddle, and with the horse's bridle over his arm he walked beside young Wimpje Van Witt.

"Juffrouw Van Witt," the captain said softly, "have you missed me?"

There was no answer, only a sudden little sob. "Why, Wimpje, my darling, so much?" he cried, and kissed the little hand he held in his over and over again.

"To leave me for two days, Captain Cawardine, and without a word, and to risk your life as you did."

"I went hunting, sweetheart."

"Out of the garret window?"

"Later you shall know all, darling."

She turned upon him with a quiver of her pretty lips. "I must tell father. I can bear it no longer. To think you are an Englishman, and that of all the world he should just hate Englishmen. I fear he will never pardon our deception."

"My darling, it will all end well, believe me. Perhaps it was a foolish plan, but how else could I have had my sweetheart? All's fair in love and war, and it was kind of Juffrouw Pampy to let me come courting her for the

joy of seeing you. It was for the best, Wimpje dear. Captain Cawardine was an unwelcome suitor for the hand of Juffrouw Van Witt—what was to be done?"

"Oh, if my father will only forgive me for loving you! If he does not—why then I'll follow you to the end of the earth, for I cannot live without you. O Jack, I'll go as far then as ever you wish—even to Boston, Jack."

IX.

A PEACEFUL late-afternoon quiet rested over the living-room, and the holy saint was fading into twilight. The teakettle was singing on the warm-stoof; a couple of logs blazed on the hearth where sat the Van Witt cat washing its face with one soft paw.

Two sighs broke the stillness.

"Why, Wimpje?"

"Why, father?"

"I wish to speak to you, Wimpje."

"I've something to say to you, father."

Wimpje brought the settle to the sacred chair, and rubbed her soft cheeks against Mynheer's hand.

"How old are you, Wimpje?"

"Eighteen, father."

"Now, Wimpje, did it—did it ever occur to you that young girls do sometimes marry?"

Wimpje sighed.

"Do you like Jan Wissenkerke, Wimpje child?"

The answer was faint but satisfactory. A sudden thought struck Mynheer. "On principle you are not opposed to marrying; eh, Wimpje? Young maids have such foolish notions sometimes."

The answer was more inaudible and yet satisfactory. Whereupon Mynheer proceeded.

"Wimpje child, there now, tell your old father, is your heart quite free?"

Here Wimpje, to Mynheer's speechless consternation, laid her face on his shoulder and burst into tears.

"Heereje! What does this mean? And just as I had a nice little plan. O Wimpje!"

"A plan?" Juffrouw Van Witt murmured, sobbing.

"Well, child, you must be told. Here is Pamplona—you always liked Pamplona, and some day I meant to marry her; but there was no hurry, and all would have gone well, but just then who comes but Captain Cawardine courting my Pamplona."

Here a smile quivered through Wimpje's tears.

"Not that I am surprised; he might have done worse. Pamplona has wonderful staying qualities. So she took him, but only because I—I had not spoken."

Mynheer was unspeakably elated. "The fact is, child, not to hide anything from you, the decided stand I took in the matter of the siege of Nieuw Amsterdam (there are those who call it heroic) has been misconstrued. The English Government doubts my patriotism; the English Government requires a guarantee for my—ahem!—loyalty."

Wimpje gazed at her heroic father with frightened eyes.

"Wimpje, tell me, what do you think of Captain Cawardine?"

"Wimpje controlled a sudden sparkle in her brown eyes, and hung her head discreetly. "He seems a worthy young man."

"He is more than that." Mynheer spoke with sudden impatience. "He is a young man of taste and discretion, or he would not have courted Juffrouw van Twist. That wound will heal. He is, besides, of excellent family and well to do, and he is as a son to Colonel Borden. Being so well with the government, young and sturdy, and pleasant to gaze upon, I thought—yes, I thought—"

"Well, father?"

"I thought, Wimpje, you might n't do much better, and you could do a great deal worse."

"But he is an Englishman, father."

"A mere prejudice, child. Through Captain Cawardine your old father could get many a good trading privilege. There, listen to me, Wimpje, do not sacrifice your father for a foolish fancy."

"So it would please you if I married Captain Cawardine?" young Wimpje said meekly.

"It would be very wise, child."

"Very well, then, for your sake, you dear—and before he could remonstrate Wimpje's arms were flung about his neck.

"I am so happy, so very happy, you dear old father!"

"Why?" Mynheer cried, struggling.

"Now you will have to forgive. Wait, I'll call Jack."

And Jack came, smiling and eager.

"O Jack, I've promised to marry you," Wimpje cried; and before Mynheer could say a word she was in Jack's arms.

"This is very extraordinary, Captain; will you explain, Wilhelmina? I thought, Juffrouw, you said your heart was not free."

"It was n't, for there was—Jack."

"But there was also Juffrouw van Twist. Blicksem! Whom did you come courting, Captain Cawardine?"

But Wimpje was already by his side stroking his fat cheek. "It was me he came courting, and it was all Pamplona's little plan, so you will have to forgive her: say you forgive us all, you dear."

Of course Mynheer forgave, and before

winter set in there were two fine weddings at Bovenkirk.

In the course of time Cornelis Van Witt's increasing wealth proved on what excellent terms he was with the government, while the wisdom and patriotism of Governor Cawardine of New York have passed into history.

As for the ghost of the mad sexton, it disappeared with Brammatje Baas.

Whoever doubts the truth of this narrative, let him take the elevated road in the great city of New York and search for the old church of St. Bartholomew not far from the Bowery. There will he find an ancient graveyard sur-

rounded by time-stained warehouses. He will observe that the crumbling headstones still stand in straight rows as placed by the mad sexton. If he searches very carefully he will discover on one weather-beaten slab, beneath a solitary willow tree the years have spared, this half-obliterated inscription:

CORNELIS VAN WITT,
DIED AT THE GREAT AGE OF 90
IN THE TOWN OF NEW YORK.
1695.

REQUIESCAT IN PACE.

Anna Eichberg King.

SUNSET AND SHORE.

(WRITTEN FOR A FRIEND'S MUSIC.)

BIRDS that like vanishing visions go winging
White, white in the flame of the sunset's burning,
Fly with the wild spray the billows are flinging;
Blend, blend with the nightfall, and fade, unreturning!

Fire of the heaven, whose splendor, all glowing,
Soon, soon must end, and in darkness shall perish;
Sea-bird and flame-wreath, and foam lightly blowing,
Soon, soon though we lose you, your beauty we cherish.

Visions may vanish, the sweetest, the dearest;
Hushed, hushed be love's voice like an echo replying;
Spirits may leave us that clung to us nearest —
Love, love, only love dwells with us undying!

George Parsons Lathrop.

LOVE, ART, AND TIME.

ON A PICTURE ENTITLED "THE PORTRAIT," BY WILL H. LOW.

SWEET Grecian girl who on the sunbright wall
Tracest the outline of thy lover's shade,
While, on the dial near, Time's hand is laid
With silent motion, fearest thou, then, all?
How that one day the light shall cease to fall
On him who is thy light; how lost, dismayed,—
By Time, and Time's pale comrade, Death, betrayed,—
Thou shalt breathe on beneath the all-shadowing pall!

Love, Art, and Time — these are the triple powers
That rule the world, and shall for many a morrow:
Love that beseecheth Art to conquer Time!
Bright is the picture, but, O fading flowers!
O youth that passes, love that bringeth sorrow —
Bright is the picture; sad the poet's rhyme.

R. W. G.

ENGRAVED BY HENRY WOLF.

"THE PORTRAIT," BY WILL H. LOW.

COLONEL CARTER OF CARTERSVILLE.

BY F. HOPKINSON SMITH.

THE COLONEL'S HOUSE IN
BEDFORD PLACE.

THE dinner was at the colonel's—an old-fashioned, partly furnished, two-story house nearly a century old which crouches down behind a larger and more modern dwelling fronting on Bedford Place within a stone's throw of the tall clock tower of Jefferson Market.

The street entrance to this curious abode is marked by a swinging wooden

gate opening into a narrow tunnel which dodges under the front house. It is an uncanny sort of passageway, moldy and wet from a long neglected leak overhead, and lighted at night by a rusty lantern with dingy glass sides.

On sunny days this gruesome tunnel frames from the street a delightful picture of a bit of the yard beyond, with the quaint colonial door and its three steps let down in a welcoming way.

Its retired location and shabby entrance brings it quite within the colonel's income, and as the rent is not payable in advance, he has surrounded himself not only with all the comforts but with many of the luxuries of a more pretentious home. In this he is assisted by his negro servant Chad,—an abbreviation of Nebuchadnezzar,—who is chambermaid, cook, butler, body-servant, and boots, and who by his marvelous tales of the magnificence of “de old fambly place in Kyartersville” has established a credit among the shopkeepers on the avenue which would be denied a much more solvent customer.

To this hospitable retreat I wended my way in obedience to one of the colonel's characteristic notes:

NO. 51 BEDFORD PLACE.
FRIDAY.

Everything is booming—Fitz says the scheme will take like the measles—dinner to-morrow at six—don't be late.

CARTER.

I had received several similar notes that week, all on the spur of the moment and all expressive of the colonel's varying moods and wants; the former suggested by his unbounded enthusiasm over this new railroad scheme, and the latter by such requests as these: “Would I lend him half a dozen napkins—his were all in the wash, and he wanted enough to carry him over Sunday. Chad would bring, with my permission, the extra pair of andirons I spoke about.” Or, “Kindly hand Chad the two magazines and a corkscrew.”

So to-night I pushed open the swinging door, felt my way along the dark passage, and crossed the small yard choked with snow at the precise minute when the two hands of the great clock in the tall tower pointed to six.

The door was opened by Chad.

“Walk right in, sah; de colonel's in de din-in'-room.”

Chad was wrong. The colonel was at that moment finishing his toilet in what he was pleased to call his “dressing-room” up-stairs, his cheery voice announcing that fact over the balusters as soon as he heard my own, coupled with the additional information that he would be down in five minutes.

What a cozy, charming interior this dining-room was!

It had once been two rooms, and two very small ones at that, divided by folding doors. From out the rear one there had opened a smaller room answering to the space occupied by the narrow hall and staircase in front. All

“IN KYARTERSVILLE.”

the interior partitions and doors dividing these three rooms had been knocked away at some time in its history, leaving an L interior having two windows in front and three in the rear.

Some one of its many occupants, more luxurious than the others, had paneled the walls of this now irregular-shaped apartment with a dark wood running half way to the low ceiling smoked and blackened by time, and had built two fireplaces—an open wood fire which laughed at me from behind my own andirons, and an old-fashioned English grate built into the chimney with wide hobs, convenient and necessary for the various brews and mixtures for which the colonel was famous.

Midway, equally warmed by both fires, stood the table, its center freshened by a great dish of celery white and crisp, with covers for three on a snow-white cloth resplendent in old India blue. At each end shone a pair of silver coasters,—heirlooms from Carter Hall,—one holding a cut-glass decanter of sherry, the other awaiting its customary bottle of claret.

On the hearth before the wood fire rested a pile of plates, also India blue, and on the mantel over the grate stood a row of bottles adapting themselves, like all good foreigners, to the rigors of our climate. Add a pair of silver candelabra with candles,—the colonel despised gas,—dark red curtains drawn close, three or four easy chairs, a few etchings and sketches loaned from my studio, together with a modest sideboard at the end of the L, and you have the salient features of a room so inviting and restful that you wanted life made up of one long dinner, continually served within its hospitable walls.

But I hear the colonel calling down the back stairs:

"Not a minute over eighteen, Chad. You ruined those ducks last Sunday."

The next moment he has me by both hands.

"My dear Major, I am pa'alized to think I kep' you waitin'. Just up from my office. Been workin' like a slave, suh. Only five minutes to dress befo' dinner. Have a drop of sherry and a dash of bitters, or shall we wait for Fitzpatrick? No? All right! He should have been here befo' this. You don't know Fitz? Most extraord'nary man; a great mind, suh; literature, science, politics, finance, everythin' at his fingers' ends. He has been of the greatest service to me since I have been in New York in this railroad enterprise, which I am happy to say is now reachin' a culmination. You shall hear all about it after dinner. Put yo' body in that chair and yo' feet on the fender—my fire and yo' fender! No, Fitz's fender and yo' andirons! Charmin' combination!"

It is delightful to watch him as he busies himself about the room, warming a big chair for

Fitz, punching the fire, brushing the sparks from the pile of plates, and testing the temperature of the claret lovingly with the palms of his hands.

He is perhaps fifty years of age, tall, slightly built; iron gray hair, brushed straight back from his forehead and overlapping his collar behind; deep-set eyes, brown and twinkling; nose prominent; cheeks slightly sunken; brow wide and high; and chin and jaw strong and marked. His mustache droops over a firm, well-cut mouth and unites at its ends with a gray goatee which rests on his shirt front.

Like most Southerners living away from great cities his voice is soft and low, and tempered with a cadence that is delicious.

He wears a black broadcloth coat,—a double-breasted garment,—with similar-colored vest and trousers, a turn-down collar, a shirt of many plaits which is under-starched and over-wrinkled but always clean, large cuffs very much frayed, a narrow black or white tie, and low shoes with white cotton stockings.

This black broadcloth coat is quite the most interesting feature of the colonel's costume. So many changes are constantly made in its general make-up that you never quite believe it is the same ill-buttoned, shiny garment until by long acquaintance you become familiar with its possibilities.

When the colonel has a funeral or other serious matter on his mind this coat is buttoned high up under his chin, showing only his gaunt throat and the stray end of a black cravat. When the question is one of a dinner he buttons it a point lower down, revealing a bit of his plaited shirt with a glimpse of his cravat. For anything so convivial as a wedding it is thrown wide open, discovering a white vest and snowy neckcloth. This last is the limit of its capacity and its happiest combination.

These several make-ups used once to surprise me, and I often found myself insisting that the looseness and grace with which this garment flapped around the colonel's thin legs was only possible in a brand-new coat having all the spring and lightness of youth in its seams. But I had always been mistaken. I had only to look at the mismatched buttons and the raveled edge of the lining fringing the tails.

The colonel wears to-night the lower-button style with the white tie. It was indeed the adjustment of this necessary article which consumed the five minutes passed in his dressing-room, slightly lengthened by the time necessary to trim his cuffs—a little nicety which he rarely overlooked and which it mortified him to forget.

What a frank, outspoken, sincere, generous, tender-hearted fellow he is! Happy as a boy. Hospitable to the verge of beggary. Enthusiastic as he is visionary. A Virginian of good birth, fair education, and limited knowledge of

the world and of men; proud of his ancestry, proud of his State, and proud of himself; believing in States' rights, slavery, and the Confederacy; and away down in the bottom of his soul still clinging to the belief that the poor white trash of the earth includes about everybody outside of Fairfax County.

With these antecedents it is easy to see that his "reconstruction" is as hopeless as that of the famous Greek frieze, outwardly whole and yet always a patchwork. So he chafes continually under what he believes to be the tyranny and despotism of an undefined autocracy, which, in a general way, he calls "the Government," but which really refers to the distribution of certain local offices in his own immediate vicinity.

"DISHIN' THE DINNER."

When he hands you his card it bears this unabridged inscription:

Colonel George Fairfax Carter,
of Carter Hall,
Cartersville, Virginia.

He omits "United States of America," simply because it would add nothing to his dignity.

A SHARP double knock at the outer gate, and the next instant a stout, thick-set, round-faced man of forty, with merry, bead-like eyes protected by big bowed spectacles, pushed open the door and peered in good-humoredly.

The colonel sprang forward and seized him by both shoulders.

"What the devil do you mean, Fitz, by comin' ten minutes late? Don't you know, suh, that the burnin' of a canvasback is a crime?"

"Stuck in the snow? Well, I'll forgive you this once, but Chad won't. Give me yo' coat

—bless me! it is as wet as a setter dog. Now put yo' belated carcass into this chair which I have been warmin' for you, right next to my dearest old friend, the Major. Major, Fitz!—Fitz, the Major! Take hold of each other. Does my heart good to get you both together. Have you brought a copy of the prospectus of our railroad? You know I want the Major in with us on the groun' flo'. But after dinner — not a word befo'."

This railroad was the colonel's hope for the impoverished acres of Carter Hall, but lately saved from foreclosure by the generosity of his aunt Miss Nancy Carter, who redeemed it with almost all her savings, the house and half of the outlying lands being thereupon deeded to her. The other half was retained by the colonel.

I explained to Fitz immediately after his hearty greeting that I was a humble painter and not a major at all, and had not the remotest connection with any military organization whatever; but that the colonel always insisted upon surrounding himself with a staff, and that my promotion was in conformity with this idea.

The colonel laughed, seized the poker, and rapped three times on the floor. A voice from the kitchen rumbled up:

"Comin', sah!"

It was Chad "dishin' the dinner" below, his explanations increasing in distinctness as he pushed the rear door open with his foot, both hands being occupied with the soup tureen which he bore aloft and placed at the head of the table.

In a moment more he retired to the outer hall and reappeared brilliant in white jacket and apron. Then he ranged himself behind the colonel's chair and with great dignity announced that dinner was served.

"Come, Major! Fitz, sit where you can warm yo' back — you are not thawed out yet. One minute, gentlemen — an old custom of my ancestors which I never omit."

The blessing was asked with becoming reverence; then there was a slight pause and the colonel lifted the cover of the tureen and sent a savory cloud of incense to the ceiling.

The soup was a cream of something with baby crabs. There was also a fish, — boiled, — with slices of hard eggs fringing the dish, oaled by a hedge of parsley and supplemented by a pyramid of potatoes with their jackets ragged as tramps. Then a ham, brown and crisp, and bristling all over with cloves.

Then the ducks!

It was beautiful to see the colonel's face when Chad, with a bow like a folding jack-knife, held this dish before him.

"Lay 'em here, Chad — right under my nose. Now hand me that pile of plates siz-

"GENTLEMEN, A TRUE SOUTHERN LADY."

zlin' hot, and give that caarvin' knife a turn or two across the hearth. Major, dip a bit of celery in the salt and follow it with a mou'ful of claret. It will prepare yo' palate for the kind of food we raise gentlemen on down my way. See that red blood, suh, followin' the knife!"

"Suit you, marsa?" Chad never forgot his slave days.

"To a turn, Chad—I would n't take a thousand dollars for you," replied the colonel, relapsing as unconsciously into an old habit.

"There, Major," said the colonel as Chad

laid the smoking plate before me, "is the breast of a bird that fo' days ago was divin' for wild celery within fo'ty miles of Caarter Hall. My dear old Aunt Nancy sends me a pair every week, bless her sweet soul! Fill yo' glasses and let us drink to her health and happiness." Here the colonel rose from his chair: "Gentlemen, the best thing on this earth—a true Southern lady!"

"Now, Chad, the red pepper."

"No jelly, Colonel?" said Fitz, with an eye on the sideboard.

"Jelly? No, suh; not a suspicion of it. A pinch of salt, a dust of cayenne, then shut yo' eyes and mouth and don't open them 'cept for a drop of good red wine. It is the salt marsh in the early mornin' that you are tastin', suh—not molasses candy. You Nawtherners don't really treat a canvasback with any

FITZ.

degree of respect. You ought never to come into his presence when he lies in state without takin' off yo' hats. That may be one reason why he skips over the Nawthern States when he takes his annual fall outin'." And he laughed heartily.

"But you use it on venison?" argued Fitz.

"Venison is diff'ent, suh. That game lives on moose buds, the bark of sugar maple, and the tufts of sweet grass. There is a propriety and justice in his endin' his days smothered in sweets; but the wild duck, suh, is bawn of the salt ice, braves the storm, and lives a life of peyl and hardship. You don't degrade a' oyster, a soft shell crab, or a clam with confectionery; why a canvasback duck?"

"Now, Chad, serve coffee."

The colonel pushed back his chair and opened a drawer in a table on his right, producing three clay pipes with reed stems, and a buckskin bag of tobacco. This he poured out on a plate, breaking the coarser grains with the palms of his hands, and filled the pipes with the greatest care.

Fitz watched him curiously, and when he reached for the third pipe said:

"No, Colonel, none for me; smoke a cigar—got a pocketful."

"Smoke yo' own cigars, will you, and in the presence of a Virginian? I don't believe you have got a drop of Irish blood left in yo' veins, or you would take this pipe."

"Too strong for me," remonstrated Fitz.

"Throw that villainous device away, I say, Fitz, and surprise yo' nostrils with a whiff of this. Virginia tobacco, suh,—raised at Caartersville,—cured by my own servants. No?

Well, you will, Major. Here, try that; every breath of it is a nosegay," said the colonel, turning to me.

"But, Colonel," continued Fitz, with a sly twinkle in his eye, "your tobacco pays no tax. With a debt like ours it is the duty of every good citizen to help raise it. Half the cost of this cigar goes to the Government."

It was a red flag to the colonel, and he laid down his pipe and faced Fitz squarely.

"Tax! On our own productions, suh! Raised on our own land! Are you again forgettin' that you are an Irishman and becomin' one of these money-makin' Yankees? Have n't we suffe'd enough—robbed of our property, our lands confiscated, our slaves toun from us; nothin' left but our honor and the shoes we stand in!"

The colonel on cross-examination could not locate any particular wholesale robbery, but it did not check the flow of his indignation.

"Take, for instance, the town of Caartersville: look at that peaceful village which for mo' than a hundred years has enjoyed the privileges of free government; and not only Caartersville, but all our section of the State."

"Well, what 's the matter with Cartersville?" asked Fitz, lighting his cigar.

"Matter, suh! Just look at the degradation it fell into hardly ten years ago. A Yankee jedge jurisdiction' our laws, a Yankee sheriff enfo'cin' 'em, and a Yankee postmaster distributin' letters and sellin' postage stamps."

"But they were elected all right, Colonel, and represented the will of the people."

"What people? Yo' people, not mine. No, my dear Fitz; the Administration succeeding the war has treated us shamefully, and will go down to postehity as infamous."

The colonel left his chair and began pacing the floor, his indignation rising at every step.

"To give you an idea, suh," he continued, "of what we Southern people suffe'd immediately after the fall of the Confederacy, let me state a case that came under my own observation.

"Colonel Temple Talcott of Fokeer County, Virginia, came into Talcottville one mornin', suh,—a town settled by his ancestors,—ridin' upon his horse—or rather a mule, suh, belongin' to his overseer. Colonel Talcott, suh, belonged to one of the vely fust families in Virginia. He was a son of Jedge Thaxton Talcott, suh, and grandson of General Snowden Stafford Talcott of the Revolutionary War. Now, suh, let me tell you right here that the Talcott blood is as blue as the sky, and that every gentleman bearin' the name is known all over the county, suh, as a man whose honor is dearer to him than his life, and whose word is as good as his bond. Well,

suh, on this mornin' Colonel Talcott left his plantation in charge of his overseer—he was workin' it on shares—and rode through his estates to his ancestral town, some five miles distant. It is true, suh, these estates were no longer in his name, but that had no bearin' on the events that followed; he ought to have owned them, and would have done so but for some vely ungentlemanly fo'closure proceedin's which occurred immediately after the war.

"On arriving at Talcottville the colonel dismounted, handed the reins to his servant,—or perhaps, suh, one of the niggers around the do',—and entered the post-office. Now, suh, let me tell you that one month befo' the Government, contrary to the express wishes of a great many of our leadin' citizens, had sent a Yankee postmaster to Talcottville to administer the postal affairs of that town. No sooner had this man taken possession than he began to be exclusive, suh, and to put on airs. The vely fust air he put on was to build a fence in his office and compel our people to transact their business through a hole. This, suh, in itself was vely gallin', for up to that time the mail had always been dumped out on the table in the stage office and every gentleman had he'ped himself. The next thing was the closin' of his mail bags at a' hour fixed by himself. This became a great inconvenience to our citizens, who were often late in finishin' their correspondence, and who had always found our former postmaster willin' either to hold the bag over until the next day or send it across to Drummondtown by a boy to catch a later train.

"Colonel Talcott's mission to the post-office, suh, was to mail a letter to his factor in Richmond, Virginia, on business of the utmost importance to himself, suh—namely, the raisin' of a small loan upon his share of the crop. Not the crop that was planted, suh, but the crop that he expected to plant.

"Colonel Talcott approached the hole, and with that Chesterfieldian manner which has distinguished the Talcotts for mo' than two centuries asked the postmaster for the loan of a three-cent postage stamp.

"To his astonishment, suh, he was refused.

"Think of a Talcott, suh, in his own county town bein' refused a three-cent postage stamp by a low-lived Yankee, who had never known a gentleman in his life, suh! The colonel's first impulse, suh, was to haul the scoundrel through the hole and kearve him; but then he remembered, suh, that he was a Talcott and could not demean himself, and drawin' himself up again with that manner which was grace itself he requested the loan of a three-cent postage stamp until he should communicate with

his factor in Richmond, Virginia; and again, suh, he was refused. Well, suh, what was there left for a high-toned Southern gentleman to do? Colonel Talcott drew his revolver from the leg of his boot and shot that Yankee scoundrel through the heart and killed him on the spot.

"And now, suh, comes the most remarkable part of this story. If it had not been for Major Tom Yancey, Jedge Kerfoot, and myself there would have been a lawsuit."

Fitz lay back in his chair and roared.

"And they did not hang the colonel?"

"Hang a Talcott! No, suh; we don't hang gentlemen down our way. Jedge Kerfoot vely properly charged the coroner's jury that it was a matter of self-defense, and Colonel Talcott was not detained, suh, mo' than haalf an hour."

The colonel rose, unlocked a closet in the sideboard, and produced a black bottle labeled in ink, "Old Cherry Bounce, 1848."

"You must excuse me, gentlemen, but the discussion of these topics has quite unnerved me. Allow me to share with you a thimbleful."

Fitz drained his glass, cast his eyes upward, and said solemnly, "To the repose of the postmaster's soul."

THE GARDEN SPOT OF VIRGINIA SEEKS AN OUTLET TO THE SEA.

CHAD was just entering the small gate which shut off the underground passage when I arrived opposite the colonel's cozy quarters. I had come to listen to the details of that booming enterprise with the epidemic proclivities the discussion of which had been cut short by the length of time it took to kill the postmaster the night before.

It was quite evident that his master ex-

"CHAD WAS GROANING UNDER A SQUARE WICKER BASKET."

"MY FIRE IS MY FRIEND."

pected me, for Chad was groaning under a square wicker basket, containing among other luxuries and necessities half a dozen bottles of claret, a segment of cheese, and some heads of lettuce; the whole surmounted by a clean leather-covered pass-book inscribed with the name and avenue number of the confiding and accommodating grocer who supplied the colonel's daily wants.

"De colonel an' Misser Fizpat'ic bofe waitin' for you, sah," said that obsequious darky, preceding me through the dark passage. I followed, mounted the old-fashioned wooden steps, and fell into the outstretched arms of the colonel before I could touch the knocker.

"Here he is, Fitz!" and the next instant I was sharing with that genial gentleman the warmth of the colonel's fire.

"Now then, Chad," called out the colonel, "take this lettuce and give it a dip in the snow for five minutes; and here, Chad, befo' you go hand me that claret. Bless my soul! it is as cold as a dog's nose; Fitz, set it on the mantel. And hurry down to that mutton, Chad, I tell you. Never mind the basket. Leave it where it is."

Chad chuckled out to me as he closed the door: "'Spec' I know mo' 'bout dat saddle den de colonel. It ain't a-burnin' none." And the colonel, satisfied now that Chad's hand

had reached the oven door, made a vigorous attack on the blazing logs with the tongs, and sent a flight of sparks scurrying up the chimney.

There was always a glow and breeze and sparkle about the colonel's fire that I found nowhere else. It partook to a certain extent of his personality—open, bright, and with a great draft of enthusiasm always rushing up a chimney of difficulties, buoyed up with the hope of the broad clear of the heaven of success above.

"My fire," he would say, "is my friend; and sometimes, my dear boy, when you are all away and Chad is out, it seems my only friend. After it talks to me for hours we both get sleepy together, and I cover it up with its gray blanket of ashes and then go to bed myself. Ah, Major! when you are gettin' old and have no wife to love you and no children to make yo' heart glad, a wood fire full of honest old logs, every one of which is doing its best to please you, is a great comfort."

"Draw closer, Major; vey cold night, gentlemen. We do not have any such weather in my State. Fitz, have you thawed out yet?"

Fitz looked up from a pile of documents spread out on his lap, his round face aglow with the firelight, and compared himself to half a slice of toast well browned on both sides.

"I am glad of it. I was worried about you when you came in. You were chilled through."

Then turning to me: "Fact is, Fitz is a little overworked. Enormous strain, suh, on a man solving the vast commercial problems that he is called upon to do every day."

After which outburst the colonel crossed the room and finished unpacking the basket, placing the cheese in one of the empty plates on the table, and the various other commodities on the sideboard. When he reached the pass-book he straightened himself up, held it off admiringly, turned the leaves slowly, his face lighting up at the goodly number of clean pages still between its covers, and said thoughtfully:

"Very beautiful custom, this pass-book system, gentlemen, and quite new to me. One of the most courteous attentions I have received since I have taken up my residence Nawth. See how simple it is. I send my servant to the sto' for my supplies. He returns in haalf an hour with everythin' I need, and brings back this book which I keep,—remember, gentlemen, which I keep,—a mark of confidence which in this degen'rate age is refreshin'. No vulgar bargainin', suh; no disagreeable remarks about any former unsettled account. It certainly is delightful."

"When are the accounts under this system generally paid, Colonel," asked Fitz.

With the exception of a slight tremor around the corners of his mouth the face of the colonel expressed nothing but the idlest interest.

"I have never inquired, suh, and would not hurt the gentleman's feelin's by doin' so for the world," he replied with dignity. "I presume, when the book is full."

Whatever might have been Fitz's mental workings, there was no mistaking the colonel's. He believed every word of it.

"What a dear old trump the colonel is," said Fitz, turning to me, his face wrinkling all over with suppressed laughter.

All this time Chad was passing in and out, bearing dishes and viands, and when all was ready and the table candles were lighted he announced that fact softly to the colonel and took his customary place behind his master's chair.

The colonel was as delightful as ever, and had lost none of his charm, his talk ranging from politics and family blood to possum hunts and modern literature, while the mutton and its accessories did full credit to Chad's culinary skill.

In fact the head of the colonel's table was his throne. Nowhere else was he so charming, and nowhere else did the many sides to his delightful nature give out such varied hues.

Fitz, practical business man as he was, would listen to his many schemes by the hour, charmed into silence and attentive appreciation by the sublime faith that sustained the colonel, and the perfect honesty and sincerity which underlay everything he did.

But it was not until the cheese had completely lost its geometrical form, the coffee was served, and the pipes were lighted that the subject which of all others absorbed him was broached. Indeed, it was a rule of the colonel's, never infringed upon, that, no matter how urgent the business, the dinner-hour was to be kept sacred.

"Salt yo' food, suh, with humor," he would say. "Season it with wit, and sprinkle it all over with the charm of good-fellowship, but never poison it with the cares of yo' life. It is an insult to yo' digestion, besides. bein', suh, a mark of bad breedin'."

"Now, Major," began the colonel, turning to me, loosening the string around a package of papers, and spreading them out like a game of solitaire, "draw yo' chair closer. Fitz, hand me the map."

A diligent search revealed the fact that the map had been left at the office, and so the colonel proceeded without it, appealing now

and then to Fitz, who leaned over his chair, his arm on the table.

"Befo' I touch upon the financial part of this enterprise, Major, let me show you where this road runs," said the colonel, reaching for the casters. "I am sorry I have n't the map, but we can get along very well with this"; and he unloaded the cruets.

"This mustard-pot, here, is Caartersville, the starting-point of our system. This town, suh, has now a population of mo' than fo' thousand people; in five years it will have fo'ty thousand. From this point the line follows the bank of the Big Tench River—marked by this caarving-knife—to this salt-cellar, where it crosses its waters by an iron bridge of two spans, each of two hundred and fifty feet. Then, suh, it takes a sharp bend to the southard and stops at my estate, the road-bed skirting within a convenient distance of Caarter Hall.

"Please move yo' arm, Fitz. I haven't room enough to lay out the city of Fairfax. Thank you.

"Just here," continued the colonel, utilizing the remains of the cheese, "is to be the future city of Fairfax, named after my ancestor, suh, General Thomas Wilmot Fairfax of Somerset, England, who settled here in 1680. From here we take a course due nawth, stopping at Talcottville eight miles, and thence nawthwesterly to Warrentown and the broad Atlantic; in all fifty miles."

"Any connecting road at Warrentown?" I asked.

"No, suh, nor anywhere else along the line. It is absolutely virgin country, and this is one of the strong points of the scheme, for there can be no competition"; and the colonel leaned back in his chair and looked at me with the air of a man who had just informed me of a legacy of half a million of dollars and was watching the effect of the news.

I preserved my gravity and followed the imaginary line with my eye, bounding from the mustard-pot along the carving-knife to the salt-cellar and back in a loop to the cheese, and then asked if the Big Tench could not be crossed higher up, and if so why was it necessary to build twelve additional miles of road.

"To reach Carter Hall," said Fitz quietly.

"Any advantage?" I asked in perfect good faith.

The colonel was on his feet in a moment.

"Any advantage? Major, I am surprised at you! A place settled mo' than one hundred years ago, belongin' to one of the vely fust fam'lies of Virginia, not to be of any advantage to a new enterprise like this! Why, suh, it will give an air of respectability to the whole

thing that nothin' else could ever do. Leave out Caarter Hall, suh, and you pa'alize the whole scheme. Am I not right, Fitz?"

"Unquestionably, Colonel. It is really all the life it has," replied Fitz, solemn as a graven image, blowing a cloud of smoke through his nose.

"And then, suh," continued the colonel with increasing enthusiasm, oblivious to the point of Fitz's remark, "see the improvements. Right here to the eastward of this cheese we shall build a round-house marked by this napkin-ring, which will accommodate twelve locomotives, construct extensive shops for repairs, and erect large foundries and car shops. Altogether, suh, we shall expend at this point mo' than one million of dollars"; and the colonel threw back his head and gazed at the ceiling, his lips computing imaginary sums.

"Befo' these improvements are complete it will be necessary, of course, to take care of the enormous crowds that will flock in for a restin'-place. So to the left of this napkin-ring, on a slightly risin' ground,—just here where I raise the cloth,—is where the homes of the people will be erected. I have the refusal"—here the colonel lowered his voice—"of two thousand acres of the best private-residence land in the county, contiguous to this very spot, which I can buy for fo' dollars an acre. It is worth fo' dollars a square foot if it is worth a penny. But, suh, it would be little short of highway rob'ry to take this property at that figger, and I shall arrange with Fitz to include in his prospectus the payment of one hundred dollars an acre for this land, payable either in the common stock of our road or in the notes of the company, as the owners may elect."

"But, Colonel," said I, with a sincere desire to get at the facts, "where is the Golconda—the mine? Where do I come in?"

"Patience, my dear Major; I am coming to that.

"Fitz, read that prospectus."

"I HAVE," said Fitz, turning to the colonel, "somewhat modified your rough draft, to meet the requirements of our market; but not materially. Of course I cannot commit myself to any fixed earning capacity until I go over the ground, which we will do together shortly. But"—raising the candle to the level of his nose—"this is as near as I can come to your ideas with any hopes of putting the loan through here. I have, as you will see, left the title of the bond as you wished, although the issue is a novel one to our Exchange." Then turning to me: "This of course is only a preliminary announcement."

out further notice.

"There, Major, is a prospectus that caarries conviction on its vehy face," said the colonel, reaching for the document.

I complimented the eminent financier on his skill, and was about to ask him what it all meant, when the colonel, who had been studying it carefully, broke in with:

"Fitz, there is one thing you left out."

"Yes, I know, the name of the banker; I have n't found him yet."

"No, Fitz; but the words, '*Subscriptions opened Simultaneously in New York, London, Richmond, and —*'"

"Cartersville?" suggested Fitz.

"Certainly, suh."

"Any money in Cartersville?"

"No, suh, not much; but we can *subscribe*, can't we? The name and influence of our leadin' citizens would give tone and dignity to any subscription list. Think of this, suh!" and the colonel traced imaginary inscriptions on the back of Fitz's prospectus with his forefinger, at the same time voicing them as he went on:

The Hon. JOHN PAGE LOWNES,

Member of the State Legislature .. 1000 shares

The Hon. I. B. KERFOOT,

Jedge of the District Court of

Fairfax County..... 1000 shares

Major THOMAS C. YANCEY,

Late of the Confederate Army 500 shares

"These gentlemen are my friends, suh, and would do anythin' to oblige me."

Fitz sharpened a lead pencil and without a word inserted the desired amendment.

The colonel studied the document for another brief moment and struck another snag.

"And, Fitz, what do you mean by 'full protection guaranteed'?"

"To the bondholder, of course — the man who pays the money."

"What kind of protection?"

"Why, the right to foreclose the mortgage when the interest is not paid, of course," said Fitz with a surprised look.

"Put yo' pencil through that line, quick — none of that for me. This fo'closure business has ruined haalf the gentlemen in our county, suh. But for that foolishness two-thirds of our fust families would still be livin' in their homes. No, suh, strike it out!"

"But, my dear Colonel, without that protecting clause you could n't get a banker to touch your bonds with a pair of tongs. What recourse have they?"

"What reco'se? Reorganization, suh! A boilin'-down process which will make the stock — which we practically give away at fifty cents on the dollar — twice as valuable. I appreciate, my dear Fitz, the effo'ts which you are makin' to dispose of these secu'ities, but you must remember that this plan is *mine*."

"Now, Major," locking his arm in mine, "listen; for I want you both to understand exactly the way in which I propose to forward this enterprise. Chad, bring me three wine glasses and put that Madeira on the table — don't disturb that railroad! — so."

"My idea, gentlemen," continued the colonel, filling the glasses himself, "is to start this scheme honestly in the beginnin' and avoid all dissatisfaction on the part of these vehy bondholders thereafter."

"Now, suh, in my experience I have always discovered that a vehy general dissatisfaction is sure to manifest itself if the coupons on secu'ities of this class are not paid when they become due. As a gen'ral rule this interest money is never earned for the fust two years, and the money to pay it with is invariably stolen from the principal. All this dishonesty I avoid, suh, by the issue of my Deferred Debenture Bonds."

"How?" I asked, seeing the colonel pause for a reply.

"By cuttin' off the fust fo' coupons. Then everybody knows exactly where they stand. They don't expect anythin' and they never get it."

Fitz gave one of his characteristic roars and asked if the fifth would ever be paid.

"I can't at this moment answer, but we hope it will."

"It is immaterial," said Fitz, wiping his eyes. "This class of purchasers are all speculators, and like excitement. The very uncertainty as to this fifth coupon gives interest to the investment, if not to the investor."

"None of yo' Irish impudence, suh. No, gentlemen, the plan is not only fair but reasonable. Two years is not a long period of time in which to foster a great enterprise like the C. & W. A. L. R. R., and it is for this purpose that I issue the Deferred Debentures. Deferred—put off; Debenture—owed. What we owe we put off. Simple, easily understood, and honest."

"Now, suh," turning to Fitz, "if after this frank statement any graspin' banker seeks to trammel this enterprise by any fo'closure clauses, he sha'n't have a bond, suh. I 'll take them all myself fust."

Fitz agreed to the striking out of all such harassing clauses, and the colonel continued his inspection.

"One mo' and I am done, Fitz. What do you mean by Founders' shares?"

"Shares for the promoters and the first subscribers. They cost one-tenth of the ordinary shares and draw five times as much dividend. It is quite a popular form of investment. They, of course, are not sold until all the bonds are disposed of."

"How many of these Founders' shares are there?"

"Fifty thousand at ten dollars each."

The colonel paused a moment and commenced inwardly with himself.

"Put me down for twenty-five thousand, Fitz. Part cash, and the balance in such po'tion of my estate as will be required for the purposes of the road."

The colonel did not specify the proportions, but Fitz made a pencil memorandum on the margin of the prospectus with the same sort of respectful silence he would have shown the Rothschilds in a similar transaction, while the colonel refilled his glass and held it between his nose and the candle.

"And now, Major, what shall we reserve for you?" said he, laying his hand on my shoulder. Before I could reply Fitz raised his hand, looked at me significantly over the rims of his spectacles, and said:

"With your permission, Colonel, the Major and I will divide the remaining twenty-five

thousand between ourselves. I will give you ample notice, Major, before the first partial payment is called in."

"You overwhelm me, gentlemen," said the colonel, rising from his seat and seizing us by the hands. It has been the dream of my life to have you both with me in this enterprise, but I had no idea it would be realized so soon. Fill yo' glasses and join me in a sentiment that is dear to me as my life—"The Garden Spot of Virginia in search of an Outlet to the Sea."

Nothing could have been more exhilarating than the colonel's manner after this. His enthusiasm became so contagious that I began to feel something like a millionaire myself, and to wonder whether, after all, this was not the opportunity of my life. Even Fitz was so far affected that he recanted to a certain extent his disbelief in the omission of the foreclosure clause, and even expressed himself as being hopeful of getting around it in some way.

As for the colonel, the railroad was to him already a fixed fact. He could really shut his eyes at any time and hear the whistle of the down train nearing the bridge over the Tench. The trifling details of finding a banker who would attempt to negotiate the loan, the subsequent selling of the securities, and the minor items of right of way, construction, etc., were matters so light and trivial as not to cause him a moment's uneasiness. Cartersville was to him the center of the earth, hampered and held back by lack of proper connections with the outlying portions of the universe. What mattered the rest?

"Make a memorandum, Fitz, to have me send for a bridge engineer fust thing after I get to my office in the mornin'. There will be some difficulty in gettin' a proper foundation for the center-pier of that bridge, and some one should be sent at once to make a survey. We can't be delayed at this point a day. And, Fitz, while I think of it, there should be a wagon bridge at or near this iron structure, and the timber might as well be gotten out now. It will facilitate haulin' supplies into Fairfax city."

Fitz thought so too, and made a second memorandum to that effect, recording the suggestion very much as a private secretary would an order from his railroad magnate.

The colonel gave this last order with coat thrown open and his thumbs in his vest, his back to the fire—a gesture never indulged in except on rare occasions, and then only when the very weight of the problem necessitated a corresponding bracing up and more breathing room.

These gestures, by the way, were very suggestive of the colonel's varying moods. Sometimes,

when he came home, tired out with the hard pavements of the city, so different from the soft earth of his native roads, I would find him bunched up in his chair in the twilight; face in hands, elbows on knees, crooning over the fire, with back bowed, the silver streaks in his hair glistening in the flickering firelight, building castles in the glowing coals—the old manor house restored and the barns rebuilt, the gates rehung, the old quarters repaired, the little negroes again around the doors; and he once more catching the sound of the yellow-painted coach on the gravel, with Chad helping the dear old aunt down the porch steps. This, deep down in the bottom of his soul, was really the dream and purpose of his life.

It never seemed nearer of realization than at this moment. The very thought suffused his whole being with a suppressed joy, visible in his face even when he began loosening the two lower buttons of his old coat, threw back the lapels and slowly extended his fingers fan-like over his dilating chest.

I always knew just what suddenly sweetened his smile from one of triumphant pride to one of tenderness.

"And the old home, Fitz, something must be done there; we must receive our friends properly."

Fitz agreed to everything, offering an amendment here, or a suggestion there, until our host's enthusiasm reached fever heat.

It was nearly midnight before the colonel

had confided to Fitz all the pressing necessities of the coming day. Even then he followed us both to the door with parting instructions to Fitz, saying over and over again that it had been the happiest night of his life. He would have gone with us just as he was to the outer gate had not Chad caught him half way down the steps, thrown a coat over his bare head and shoulders, and gently led him back with:

"'Clar to goodness, Marsa George, what kind foolishness dis yer? Is you tryin' to ketch yo' death?"

Once on the outside and the gate shut Fitz's whole manner changed. He became suddenly thoughtful, and did not speak until we reached the tall clock tower with its full moon of a face shining high up against the black winter night.

Then he stood still, looked out over the white street, dotted here and there with belated wayfarers trudging home through the snow, and said with a tremor in his voice which startled me:

"I could n't raise a dollar in a lunatic asylum full of millionaires on such a scheme as the colonel's, and yet I keep on lying to the dear old fellow day after day in the hope that something will turn up by which I can help him out."

"Then tell him so."

Fitz laid his hand on my shoulder, looked me straight in the face, and said:

"I cannot. It would break his heart."

(To be continued.)

F. Hopkinson Smith.

LUCA SIGNORELLI (LUCA D'EGIDIO DI MAESTRO VENTURA DE' SIGNORELLI), 1441-1523.

(ITALIAN OLD MASTERS.)

WITH all the undeniable power of Signorelli and his boldness of treatment, in spite of his daring invention and defiance of precedent, qualities which place him in the roll of the greatest of the

Renaissance painters, I do not feel disposed to accord him that position which most writers on the epoch assign him as among the very first, because he lacks the tenderness which is in my opinion inseparable from the consummate artist's greatness, and which we find in Michael Angelo's religious sculpture, in Raphael everywhere, in Bellini and in Mantegna, in Verrocchio and in Botticelli. Accomplished and masterly he is, but with a remote and se-

vere power which was one of the traits of Michael Angelo, but which is generally in him veiled by a spiritual pathos which I cannot recognize in Signorelli. In his education he was of an artistic family; and his uncle, Lazzaro Vasari, great-grandfather of Giorgio Vasari, began his instruction in drawing in his childhood, and at a still early age put him under the teaching of Piero della Francesca (Pietro degli Franceschi), who is supposed to have taken him to Rome with him. There are some evidences also that he came under the influence of Pollaiuolo (Antonio), Visscher considering the proofs conclusive as contained in certain works which he mentions. The same critic also says that Verrocchio evidently influenced Signorel-

li's style and treatment of form, as is indicated by his hardness and angularity in drawing, which reminds one of half-finished wood-carving and possibly depends on a youthful practice in wood-carving which he may have got with Verrocchio, who was a wood-carver. Visscher also credits a certain influence on his style to Botticelli, Filippino Lippi, and particularly Perugino, while he gives also a share to Da Vinci, who was the pupil of Piero della Francesca in 1455, and possibly when Signorelli was with him. I am disposed to distrust so much subtlety of attribution, and believe that in this respect German criticism often pushes conclusions beyond human possibilities, and refines for refinement's sake where the degrees are in the eye and not in the object. Burton (National Gallery Catalogue) says that "to him is due the inauguration of the study of the human form for its own sake," but he also says of his work, "in which force and tenderness are equally conspicuous," a judgment from which I must in all humility distinctly but absolutely differ. His power is shown by the rapidity with which his principal work known to us was completed. This is the series of frescos at Orvieto, which was executed in three years and three months from the time of signing the contract. Lazzaro died in 1452, when Luca was eleven years old. Luca had been drawing at least a year, and from that time until 1472 he was under the instruction or influence of Piero della Francesca, and of the Pollaiuoli. Vasari had a personal recollection of Luca from having seen him when he, Vasari, was eight years old, a reminiscence which shows in a very interesting light the briefness of the time in which the great classic Renaissance movement came up and died. The true head of the classic Renaissance was Masaccio, born in 1401; and it died with Michael Angelo in 1564, Luca Signorelli being forty years later than Masaccio, while Vasari, who had known Signorelli, saw the end of the movement. In fact, if Masaccio had lived as long as did Michael Angelo, he might have seen the latter at work. We are treating as in a sort of succession men who worked for many years together. The great work of Signorelli was done when Michael Angelo was twenty-seven; and the greatest group of artists the world ever saw at one time, Bellini, Mantegna, Verrocchio, Signorelli, Botticelli, Perugino, and Ghirlandaio, were born within a space of twenty-one years and were substantially at their prime together.

Vasari tells us that Luca's first independent work was executed in 1472,—the decoration of the chapel of Sta. Barbara in the church of S. Lorenzo at Arezzo,—and speaks of his other works in that city as of the same date. He is

next heard of at Città di Castello, where he painted a gigantic Madonna in the council hall in place of the portraits of the rebels which had been there before. This is no longer in existence. Vasari says that after working in Siena at S. Agostino he came to Florence to study the work of the other masters, and while there he painted for Lorenzo de' Medici; and as the altarpiece of S. Agostino was executed in 1498, six years after Lorenzo's death, he must have been in Florence a considerable time prior to the painting of it. Vasari says: "He painted for Lorenzo some undraped gods which earned him great praise, a picture of Our Lady with two prophets in *chiaroscuro* [monochrome] which is now in the villa of Duke Cosimo at Castello. Both these pictures he gave to Lorenzo, who in generosity and courtesy could be excelled by none. He painted also a beautiful tomb of the Virgin [Assumption]."

Visscher considers the finest of his early works to be that in the Santa Casa at Loreto, which the critic considers to show the early Florentine influence strongly.

In 1482–83 he was probably in Rome at work on the frescos of the Sistine Chapel, for in 1484 he returned to Cortona, and in the following year agreed to paint for Spoleto a "Santa Conversazione" and a "Martyrdom of St. Agnes," both of which are lost. In 1488 he painted a banner for the church of Città di Castello, for which he received the freedom of the city, and in 1489 and 1490 he was chosen councilor and (for the second time) prior of Cortona; but being engaged on work at Volterra he was unable to accept the latter honor. In Volterra he painted the "Circumcision" in the church of S. Francisco and an altarpiece in the Duomo, and the next year returned to Cortona and took office as councilor. In 1493 he painted two pictures for Città di Castello, for which he received a vineyard worth sixty florins; in 1494 a standard for Urbino, the pictures for both sides of which are preserved in S. Spirito of that town; in 1495 he was again in office, in 1496 painting in Città di Castello, and in 1497 and 1498 we find him in office again in his native Cortona. The eight frescos in Monte Oliveto near Siena were painted in 1497. He was in Siena in 1498, 1506, and 1509, and as Pinturicchio was there in those years they probably worked together, and it must be then that Signorelli did the "Calumny" from the account of the picture by Apelles, the "Bacchanalia," the "Binding and Triumph of Love," the "Coriolanus" (in the British Museum), the "Flight of Æneas," and a "Liberation of Prisoners."

The Duomo of Orvieto, which had been up to this time from its foundation one of the chief votive offerings of the Catholic world,

having been founded to commemorate the miracle of the Corpus Domini, and had united the work of the Pisani, of Arnolfo di Lapo, and of all the most eminent painters from the date of its completion in 1290, could not fail to call in the pencil of Signorelli; and as Fra Angelico had refused to complete his commission to decorate the new chapel, it was decided in 1499 to invite Luca to finish the work which Angelico had begun fifty years before, and he was called on for estimates. Luca offered to do for 200 ducats the work which Fra Angelico had abandoned, but was beaten down to 180. For this sum he undertook to do the vault of the chapel, half of which it would seem Fra Angelico had designed and two divisions of which he had painted; and he was to receive in addition a lodging with a double bed, and to provide himself all the materials except the scaffoldings, the lime, and the sand, binding himself to do work as good as, or better than, that of Fra Angelico. He was to begin working on the 25th of May, and accomplish as much as was possible during the summer. He was bound to paint the figures in the vault with his own hand, and especially the faces and the upper parts of the body, nothing to be painted without his presence or without the will and permission of the chamberlain,¹ and all the colors were to be prepared by him and to be good, perfect, and beautiful. In the event of contravention, he was to submit to a penalty of double the price agreed on, and he was required to make a deposit of twenty-five ducats with the chamberlain in proof of his good faith. The council had seen enough of the uncertainty of art in Fra Angelico to make it unwilling to risk another such failure. But the frank promise and engagement to do as good or better work than the Blessed Friar was evidence at least of Luca's confidence in his own powers. The contract was signed on the 5th of April, 1499, and on the 25th of November the council was informed that the painter had finished the four divisions designed by Fra Angelico, and Luca now asked permission to carry out the remaining four on his own designs. This permission was granted. In January he asked for an increase of pay, alleging that he was growing poorer rather than richer from his work, which may have well been the case if his gold and ultramarine were provided according to the contract. The council accorded him six quarters of pure corn and four ass-loads of wine.

On the 23d of the following April the council was again called to decide on the proposition of Signorelli to paint the four walls of the chapel according to his own designs. For this he asked 600 ducats and they finally agreed on

575, with lodgings and two beds, two quarters of grain every month, and twelve ass-loads of must at the vintage ensuing and every following vintage as long as the work should last, he finding all the colors except gold and lapis lazuli. He was to paint rather more than fewer figures than were contained in his designs (from which we must conclude that he had prepared his designs for approbation); to do the figures himself, especially the important ones; and to frame everything with decorative designs. A competent painter was to pass judgment on the work when done. Imagine a small nineteenth century painter submitting to all these restrictions and affronts to genius!

Signorelli was in Orvieto with interruptions till 1504, though in 1502 he appears again as prior of Cortona. In the winter of 1502 he painted the great altarpiece of St. Margaret of Cortona, Mary and the apostles bewailing the dead Christ, which is now in the choir of the Duomo. Visscher says: "When we think of the terrible sufferings which the master went through this year, the distressing war, the pestilence, the loss of his dear son, the deep tragedy of this splendid picture is redoubled for us; it seems a scene that the painter has gone through." In 1503 Luca was in Orvieto and painted on a stone tablet a portrait of himself with the chamberlain, Niccolo Angeli. This tablet, originally in the Capella Nuova, is now in the Opera. In 1505 he lost another son. There is a letter of 1507 in which the Duke of Urbino begs the Orvietans to pay Signorelli what they still owe him for the frescos of the new chapel, from which it seems that the work was complete and that the Orvietans had learned the ways of Fra Angelico in keeping engagements.

In the spring of 1508 Luca was sent to Florence on business of his city, and there saw the works of Fra Bartolommeo, Leonardo, and Michael Angelo, and at the end of that year he was employed with others in the Vatican by Julius II. He did some work in the apartment arranged by Nicholas IV. Among those at work there at that time were Perugino, Pinturicchio, and Sansovino.

In 1513 Giovanni de' Medici was elected pope, assuming the title of Leo X.; and the festivities on the occasion were of the most splendid description. Painters and sculptors were set to work, triumphal arches built, the arms of the Medici were set up everywhere, and all the towns connected with Rome or the family of the Medici, and all the great families, sent representatives. We know that Signorelli was there, though not in what capacity, by a letter from Michael Angelo to the Captain of Cortona, in which he says that having met Signorelli in the street in Rome in the first year

¹ Documents in the archives of Orvieto literally transcribed.

of Leo X., Luca begged him to lend him forty juli and told him where to send them, which request he complied with, sending the money by an apprentice. Some days after Luca came into his workshop while he was at work and reproached him with not having fulfilled his promise. Michael Angelo gave him forty juli more, and after a little conversation he went away and had never returned or sent the money. Buonarroti demands justice and says that if the Captain of Cortona cannot see him righted he will apply to the Roman authority. The reply of the Captain of Cortona is not known, but Visscher thinks that the apparent dishonesty was doubtless explained, because so honored and honorable a man could not play so shabby a trick.

This journey to Rome was the last important one of which we know anything. Luca was then seventy-one years old, and during the rest of his life he remained at home at work on his commissions. He painted in 1515 the Madonna for the altar of S. Vincenzo, in S. Domenico; in 1516 the "Descent from the Cross" for the fraternity of the Holy Cross in La Fratta, and in 1519 a panel for the fraternity of S. Geronimo in Arezzo. Of the last picture Vasari tells us that the panel was carried to Arezzo on the shoulders of the members of the fraternity, and that Luca himself, though stricken in years, accompanied it to see it put in its place.

After this he painted for the church on the public place in Cortona a predella of the Presentation (1521), and for the church of Sta. Maria della Pieve in Perugia a panel (which did not satisfy the priors); for the parish church of Foiano an altarpiece (1522); one for the chapel of the council-house of Cortona (1522); and a fresco in the chapel of the palace of Cardinal Passerini was begun, but left unfinished. By his will he was buried in the family vault in S. Francesco. He left his property to his son Thomas and his grandson Giulio, with the exception of small sums of money, pensions in corn and oil, and some presents of garments to other relations.

After the frescos of Orvieto the chief works of Signorelli are the two Moses subjects in the Sistine Chapel, which though in one sense more accessible to the public are much less visible, owing to the bad light and their height from

the eye. In composition they seem huddled and confused, but there are most admirable groups and single figures, as the Aaron of the "Giving of the Law," a kneeling figure to whom Moses is giving the rod, in the left-hand corner of the picture, the head of Aaron being of great beauty; but in this as in the companion, the migration of Moses in Egypt, the figures are, with one exception in the latter, draped. This one is a noble sitting figure of a young man, whose cloak floats back from his shoulders as he sits bowed in an attitude of fixed attention, listening to the reading of the law. The anatomical markings are less exaggerated than in the frescos of Orvieto, and indeed are free from that characteristic of Luca's nude figures generally. The landscape is more markedly conventional than that of Benozzo Gozzoli. To a certain extent no doubt the character of the compositions is determined by the conditions of the place and its uses as well as by the arrangement imposed by the taste of the chapter, of the Pope, or whoever decided the treatment. The necessity of putting a number of stories in one fresco made it impossible for the painter to follow out freely the suggestions of his own imagination. But this was a condition inherent in the uses of art as long as it had ecclesiastical functions, and weighed equally on all artists who worked for the Church. The burden was a heavy one, and to have submitted to it as Signorelli did perhaps justifies the compliment paid him by the chamberlain of Orvieto. Certainly so far as mastery of his material in any sense of that word, power of drawing, and knowledge of the human figure go, he was the first of his day, and among the first of the whole cycle of Italian art. *De gustibus non est disputandum*; and while I have no desire to urge the preference of the qualities which seem the most to be esteemed in a painter, and which I most enjoy, I admit with entire readiness that in the qualities of *the school*, the technical mastery which is to most critics the whole test of greatness, Signorelli is one of the most stupendous of the group at the height of modern art. Michael Angelo and Raphael alone, possibly, can be given preference over him in these respects. And even in their company he is stupendous.

W. J. Stillman.

NOTES BY T. COLE.

THE fresco by Luca Signorelli from which the detail of the "Angel Sounding the Trumpet" is taken is in the chapel of S. Brizio in the Duomo of Orvieto, and represents the resurrection of the dead. It is one of the series which adorn the walls, and measures 23 feet 6 inches wide by 22 feet high. The frescos occupy the upper half of the walls, extending from the

high ornamental dado and terminating at the arches of the ceiling. The human figures are larger than life, the angels still larger. There are two angels in the "Resurrection," and their grand figures with outstretched wings and fluttering draperies fill the upper half of the fresco. They stand upon clouds, while about their feet dart cherubs.

Beneath is the risen concourse of the dead. Some are still in the act of coming out of the ground; some stand in postures of transport, astounded and overpowered by the sound of the trumpets as they gaze upon the heavens and the falling stars; others are calmed to an ecstasy of joy as they clasp their friends; others are not yet clothed with flesh. A group of skeletons to the right come trooping round the corner, making a grotesque appearance.

The coloring is light and vigorous; the flesh-tints are brownish yellow and are strongly relieved against the light gray horizon of the sky behind, for there is no distance. The figures seem to be on the top of the

world. The upper part of the sky is in a fine tone of yellow. This portion is studded with gilded balls, toned down and in harmony with the coloring. The balls are thicker and closer as they approach the topmost portion. They symbolize the falling of the stars from heaven, in allusion to Rev. vi. 13: "And the stars of the heaven fell unto the earth, as a fig tree casteth her unripe figs, when she is shaken of a great wind." Such balls figure as stars in all of the series, many having gilded rays added. The wings of the angel shown in the detail are greenish, his robe purple, the cross of the flag red.

T. Cole.

THE INSTRUCTION OF SAINT COSMO AND SAINT DAMIAN.

THE blessed Arabian doctors, Saints Cosmo and Damian,
One day were disputing hotly of the soul and the body of man.

And the blessed Saint Cosmo contended, with a very fiery zeal,
That sins, being wounds of the spirit, were the first that they should heal.

And his brother, equally fiery, declared that the proper plan
Was to minister first to the body, and then to the spirit of man.

And while they were thus disputing, a man who was wounded sore —
Brought there to the brothers for healing — was laid on the hermitage floor.

And Saint Damian, precept with practice in harmony making go,
Was for whipping out his lancet. But Saint Cosmo motioned, "No!"

And Saint Cosmo turned to the bearers, who had brought the hurt one in,
And inquired, "Is this wounded person a person of virtue, or sin?"

And the bearers answered promptly, that, so far as they could tell,
The wounded man was a sinner and was far on his way to hell.

And prompt though the saint had questioned, and prompt though the others replied,
Death was quicker than question or answer, and in sin that sinner died!

And Saint Damian reasoned sadly: "Had we made his body whole,
We then might have cured his spirit, and so have saved his soul."

And Saint Cosmo, very humbly, to his brother made reply:
"God has shown that in our contention it was you had right, not I."

And then, by God's grace and mercy (so the ancient legends tell)
The dead man arose before them, and stood there alive and well!

And around him shone a splendor of purest heavenly light,
And they who had seemed but bearers were angels in robes of white!

And then the vision vanished: having taught that God's own plan
Is to heal first the wounds of the body, and then of the spirit of man.

Thomas A. Janvier.

BRINGING IN PRIZES.

EARLY VICTORIES OF THE AMERICAN NAVY.

NEW FACTS FROM FRENCH SOURCES.

THE career of the American Navy, strictly speaking, began with its reorganization under Washington's second administration in 1794. At the close of the Revolution the vessels that had been built or purchased for that struggle had all been captured, lost, or sold except the *Alliance*, 32 guns, the *Deane*, 32, and the *George Washington*, 20 guns, and soon after the announcement of peace these vessels also were sold.

At the time Washington assumed the reins of government in 1789 the affairs of the navy were placed in the hands of the Secretary of War, and it was not until the 30th of April, 1796, that a Navy Department was added to the President's Cabinet, Benjamin Stoddert of Georgetown, D. C., being the first Secretary. On the 27th of March, 1794, a law was passed for the establishment of a permanent and organized navy. By this law six frigates rating not less than thirty-two guns were ordered; but it is more than probable that even this step would not have been taken had it not been for the seizure of our merchant ships and the enslaving of their crews by the rovers of Barbary. These six frigates were:

	<i>Rate.</i>	<i>Tons.</i>	<i>Cost.</i>	<i>Place.</i>
Constitution . . .	44	1576	\$302,719	Boston.
President . . .	44	1576	220,910	New York.
United States . . .	44	1576	299,336	Philadelphia.
Chesapeake . . .	36	1244	220,678	Norfolk.
Congress . . .	36	1268	197,246	Portsmouth, N. H.
Constellation . . .	36	1265	314,212	Baltimore.

According to the report of the Secretary made April 1, 1794, these frigates "separately

would be superior to any single European frigate of the usual dimensions; that if assailed by numbers they would be always able to lead ahead; that they could never be obliged to go into action but on their own terms, except in a calm; and that in heavier weather they would be capable of engaging double-decked ships."

Thus at the outset we find the American naval constructors aiming at a higher standard than had yet been attained. The success they achieved will be the object of our inquiry.

"Separately [they] would be superior to any single European frigate of the usual dimensions." The *Constellation* was the first to be put to this test. At half-past twelve o'clock on the afternoon of February 9, 1799, while cruising alone in the vicinity of St. Christopher, the island of Nevis bearing five leagues west by south, her commander, Captain Thomas Truxtun, discovered a sail to the south-southeast. He immediately put before the wind, which was fresh from the north-northeast, so as to cross the stranger's course. At one o'clock the chase was standing on the port tack. Half an hour later a squall necessitated the shortening of sail. For a few minutes the vessels were lost to view, but on the weather clearing up it was seen that the stranger had sprung her maintopmast and had changed her course with a view of running into St. Eustatius. Soon after she hoisted an American flag, upon which Captain Truxtun showed his colors and gave the private signal of the day. As the chase did not answer, there was no longer any doubt of her nationality. Presently she hoisted French colors, fired a gun to leeward in "confirmation," and put about to the southeast, the *Constellation* in hot pursuit.¹

¹ Owing to the depredations of French cruisers on American commerce, the United States Government, in the spring and summer of 1798, abrogated its treaty

of alliance and other conventions with France, and authorized American officers to capture French cruisers, public or private, wherever found. Though war was

By 3.15 o'clock¹ the American frigate had gained so much as to be within "pistol-shot," at which time the Frenchman hailed. As Captain Truxtun did not reply the chase again hailed, when the *Constellation*, having gained a position off her port quarter,² poured in a full broadside. This was promptly returned by the Frenchman, when the cannonading became heavy on both sides. After a few minutes the enemy luffed up to run aboard, but owing to the loss of her maintopmast was not quick enough, so that the *Constellation*, forging ahead, ran athwart her course and poured in a raking fire. Captain Truxtun then passed along the Frenchman's starboard side, and, having received no material damage in his spars or rigging, was able to keep his ship just off the enemy's starboard bow, where she was weakest. This position he maintained fully an hour, pouring in broadside after broadside, at the same time receiving a heavy fire from his opponent.

While this was going on an "eighteen-pound ball"³ struck the *Constellation's* foretopmast just above the cap. This so injured the spar that it tottered, and was in imminent danger of giving way under the press of sail. Midshipman Porter, afterwards Commodore, was stationed in the foretop, and immediately hailed the deck, giving notice of the danger. In the excitement and uproar of battle no order was sent up. Seeing the urgency of the occasion, young Porter went aloft, cut the stopper and lowered the yard, thus relieving the mast of the pressure of sail and averting a serious mishap.

The *Constellation* now drew out of the smoke which had collected around the ships, and again running athwart the enemy's course poured in a second raking broadside. Then ranging alongside the Frenchman's bow, she opened a heavy fire from her starboard battery which soon dismounted every 18-pounder on the enemy's main deck, leaving him with only his "battery of 12-pounders."⁴ About half-past four o'clock the *Constellation* dropped astern, crossed the enemy's wake, and was about to rake for the third time, when the Frenchman surrendered. A boat was immediately sent aboard the prize, which soon returned with Captain Barreaut and the first lieutenant of the French 36-gun frigate *l'Insurgente*.

There has been some error among naval

not formally declared, it existed on the seas until the treaty of peace ratified by the Senate in February, 1801. This article treats only of the three principal battles of the war, to the history of which it brings important information derived from the reports of the French commanders. But the *Constellation* and *Boston* did not enjoy all the glory won by the American tar in this struggle; the schooners *Enterprise*, Lieutenant-Commandant Shaw, and *Experiment*, Lieutenant-Com-

writers in regard to the several actions between American and French cruisers in this *quasi* war, owing to lack of information. James Fenimore Cooper merely states that "*l'Insurgente's* armament consisted of 40 guns, French twelves, on her main-deck battery." William James, in a pamphlet entitled "Naval Occurrences between England and the United States," gives *l'Insurgente* "26 long 18-pounders upon the main deck," thus contradicting Mr. Cooper's statement of 12-pounders on the main deck. Even the French naval historian, M. Troude, has made conspicuous errors in treating of these actions, some of them in favor of the American ship. He gives *l'Insurgente* 12-pounders instead of 18-pounders on the main deck, while at the same time he gives the *Constellation* 28 12-pounders on the main deck, whereas she carried cannon of twice that weight, or 24-pounders. Moreover, Mr. James says the "nature of the *l'Insurgente's* guns nowhere appears." These irreconcilable statements have arisen from lack of information on the subject, and the great difficulty of getting at the official reports of the French commanders. These reports and all other papers dealing with American affairs of this period have been jealously guarded, inasmuch as they involve long-standing and intricate claims of American and French citizens for indemnity against privateer captures during this war.

Through the courtesy of Admiral Aube of the French Navy, late Minister of the Marine, the writer was permitted to search through the archives of the Navy Department in Paris, where he found the official reports of the French commanders concerned in this war. The report of Captain Barreaut throws much light on the action between the *Constellation* and *l'Insurgente*, and determines the nature of the latter's armament, which up to this time has been in dispute. He says:

At Pitre Point, Liberty Port, this 29th Pluviose, year 7 of the French Republic. Barreaut, Frigate Captain, to the Citoyen Desfourneaux particulier of the executive directory for the Windward Islands.

CITIZEN GENERAL: It is my duty and desire to render you an exact account of my conduct on the 21st Pluviose, and of the unfortunate events following it. I shall not deviate from the truth, and as agent and military commander I beg you to be willing to judge me.

mandant Maley, both built to cruise after swift-sailing privateers and each carrying 12 guns, rendered important services and gained renown.

3 "Life of Commodore David Porter," by Admiral David D. Porter, p. 22.

4 Official report of the French commander.

The 21st Pluviose, being about three leagues off the Point [Pitre] at the northeast of Nevis, which was then due N. E. $\frac{1}{4}$ N. the wind east, the lookout called at 12.30 P.M. that there was a sail to the windward of us. I continued my course for another half-hour, then having mounted the foreyard with Citizen Petit Pierre, I saw that the stranger was running towards us. I allowed her to approach to the northwest and then decided to make my course between Saba and St. Christopher, but this vessel in approaching appeared to me and to all on the yards to be a corvette from the trim of her sails. Having, Citizen agent, engraved upon my heart your words, you are going to see how a good crew conduct themselves. I think a corvette would not frighten you. I believed it was the moment to show our haughty enemies [the English] that in spite of the superiority of their forces vessels of war might still be captured from them. I wished also to inspire confidence in my crew by hugging the wind, every one burning with ardor for the fight.

At one o'clock I tacked the same as did this vessel which continued to chase us, and at 1.30 P.M., in a squall in which the topgallant sails were lowered, the Citizen Durand then commanding the manœuver, the maintopmast fell—source of all our misfortune. Immediately, upon the advice of the coasting pilot, I steered to the N. W. $\frac{1}{4}$ N. to make St. Eustatius if I had time to make the anchorage. The vessel, which I could see was a frigate, chased me. I had hoisted the American flag; she signaled me and also hoisted an American flag.

I found myself in a position to avoid no longer an engagement, and as the stranger still pursued me it became necessary to ascertain her nationality. I therefore lowered the American flag and hoisted French colors with pendant, which I confirmed by a cannon shot to leeward. She hoisted her broad pendant with the American flag without confirming. I doubted yet that she was an American. I was much embarrassed by your orders, which were not to fire on the American flag. Thus an English frigate could easily have made use of this flag while chasing us, thereby avoiding the fire of our 18-pounders, with which we could have seriously injured her [the *Constellation*] during the hour and a half she was overtaking us, and thus have given me time to save myself.

Again, if I should have fired on the American frigate, with what reproach would you not have overwhelmed me. I would have commenced hostilities, and if in the end I had been defeated all the blame would have been on me; and, one might say to you, the instructions of captains of American frigates do not permit them to fire on the Republic's vessels.

Lastly, it stands to reason that having lost my maintopmast I gave the advantage to a frigate of double my strength in letting her approach within pistol-shot before defending myself. I was thus obliged to receive a full broadside from a frigate of 24 and 12 pounders, deliberately aimed at pistol-shot, which broadside made terrible havoc in my quarter-deck.

At three o'clock the combat commenced. Judge of my surprise on finding myself fought by an American frigate, after all the friendship and protection accorded to the United States. My indignation

was at its height. As soon as my first broadside was fired I cried, and with all the men on the quarter-deck and fore-castle, "Let's board her!" My cabin was invaded to get arms, and I ran to the helm to put her to windward in order to get alongside of the American frigate. *L'Insurgente* changed her first movement, but being without center sails and not being able to move the others quickly enough, the American frigate had time to run ahead of us, and having all her sails set she was beyond us, which compelled us to change our battery men.

My only remaining service were my cannons, a cannon of 18 pounds of Balozé dismounted; and manœuvering with much difficulty, we fired three broadsides. The American frigate now seemed to suspend her fire and I ordered Citizen Jourdan to suspend ours, thinking that the American captain might still be considering his conduct. But he again opened on us, so I gave orders to fire also. This frigate did not remain crossways to us, but sought by every means to take advantageous positions and completely to dismantle us. I endeavored to imitate the irregular manœuver, but the mizzen-topmast had fallen in the tops, the "brigantine" was completely riddled. All I could do was to bring it down to trim the mizzenmast, for the arms, bowlines of foremast sails, and fore-topsails were completely cut through, our topmen without doubt killed, as they did not reply; the master did not appear upon the bridge, no quartermasters were left, only a bridgeman with yard-men. All I could do was to give the order to Citizen Sire to square-brace every sail on the mizzenmast. The American frigate still having all her sails, which were only slightly injured, and moving very easily, was at pistol range in front of us.

Finally, seeing my position was hopeless, a little later on it became necessary to surrender to very superior forces. Seeing many men wounded and killed on the yards, I decided to pass to the front of the gangway to consult my second. At this moment the topmen cried out, "Two ships to windward coming down on us, and they are large vessels." I said to my second, "Rather than strike to two English ships in my disabled condition, I prefer to surrender to the American frigate, which I believe has not the right to take me," being persuaded that war did not exist between the two nations.

After two hours' combat, totally dismantled, the ship like a hulk, having as our only defense a battery of 12-pounders, yet well provided with a crew and ammunition, comparing her to an upset battery against a frigate of 24 and 12 pounders, about fifty men killed or wounded, my second said to me, "Do as you please." No objection from the others, I thought it necessary to strike so that I might have a chance to speak to the American commander.

The American frigate then sent its boat aboard to take me and my second aboard their ship, we taking nothing with us. My first question was, "Why have you fired upon the national flag? Our two nations are not at war." His only reply was, "You are my prisoner"; and made us go below, and took our arms from us. This conduct surprised me, the more so after the last news from Europe received through the corvette *la Sagesse*, and after the statement of the Citizen Mariner, who declared at the Point that the captain of the frigate *Constitution* [Nicholson] had told him that if he had overtaken

me he would not have fired the first shot on me, but that if I had fired he would have replied.

This is an exact account of my conduct. I have done everything I could in such unfortunate circumstances. I thought that about two hours of combat, the total dismantlement of my frigate, fifty men *hors de combat*, was sufficient. A greater obstinacy would have caused a greater loss of men without having any hope of escape. An hour later I would have been compelled to surrender anyhow. All just and impartial seamen will tell you that I would have been taken. My hope was that Captain Truxtun, commanding the *Constellation*, had taken much too much upon himself in firing first upon us.

The next morning I reminded the captain of the *Constellation* how he had answered one of my questions. He replied that he had special instructions, known only to himself, and that it was three months ago that war had been declared in France. You can imagine how much surprised I was, remembering your particular orders and instructions [*i. e.*, not to fire on the American flag], and I make bold to assure you that if I had been able, during the two hours that the American frigate was in our wake, within range of my two long 18-pound stern-chasers, to fire on her, I should have made it impossible for her to overtake me.

My honor, existence, all are compromised by the duplicity of this infamous government.

[Signed] BARREAUT.

A true copy signed Desfourneaux, certifying this to be an exact copy of the original deposited at the Majorite de la Marine. Le Commis Principal de la Marine, charged with the execution of the order contained in the despatch of the 28th July, 1821.

L'Orient le 6 gbre, 1821.
SCHABRIE.

Here we find that Captain Barreaut speaks of his 18-pounders in three separate places, which, taken together with the fact that an 18-pound shot struck the *Constellation's* foretopmast during the action,¹ leaves no room for doubt that *l'Insurgente's* principal armament consisted of 18-pounders. Again Captain Barreaut speaks of "une batterie de 12," showing also that he had a battery of 12-pounders. In no portion of his report does he mention, or in any way intimate, that his ship carried other than 18 and 12 pounds. All authorities agree that *l'Insurgente* carried 40 guns, which, as the rating of French frigates was peculiarly regular, rates her as a 36-gun frigate. This class of French frigates carried 26 long guns on the main deck, 10 long guns on the quarter-deck and forecastle, and 4 36-pound carronades, two on the quarter-deck and two on the forecastle.

According to M. Troude, *l'Insurgente* car-

¹ "Life of Commodore David Porter," by Admiral David D. Porter, p. 22.

ried 26 long 12-pounders, 10 long 6-pounders, and 4 carronades of 36 pounds. We have seen, however, that Captain Barreaut admits having a battery of 18-pounders and one of

FALL OF THE "CONSTELLATION'S" MAINMAST.

12-pounders, but in no way does he mention 6-pounders. There can be no doubt, then, that *l'Insurgente* carried 26 long 18-pounders on the main deck, as Mr. James states, 10 long 12-pounders on the quarter-deck and forecastle, and 4 36-pound carronades, which were always carried by French frigates of this class.

Both the *Constellation* and *l'Insurgente* were rated as 36-gun frigates, yet by a comparison of their armaments we shall find the *Constellation's* materially superior to that of her antagonist. The American frigate carried 28 long 24-pounders on the main deck and 20 long 12-pounders on the quarter-deck and forecastle, carronades, at that time, not having come into use in the American navy. This gave the *Constellation* — not allowing for deficient weight in American metal — a total of 912 pounds. Her crew numbered 309, of whom 2 were killed — one by the third lieutenant for deserting his gun early in the action — and 3 wounded. *l'Insurgente* carried 26 long 18-pounders on the main deck, 10 long

12-pounders on the quarter-deck and fore-castle, and 4 36-pound carronades, which were always carried by frigates of this class. The French pound, it must be borne in mind, was eight per cent. heavier than an English pound. Thus a French 12-pound shot weighed thirteen English pounds, and a French 24-pound shot weighed twenty-six English pounds. Calculating on this basis we find *l'Insurgente's* total weight of metal to have been 791 pounds.

Neither Captain Barreaut in his official report nor M. Troude make statements regarding *l'Insurgente's* complement. The usual complement for a French 36-gun frigate was about 300 men, but Captain Truxtun in his official report states that she carried 409 men, of whom 29 were killed, 22 badly and 19 slightly wounded. From this it must be inferred that *l'Insurgente* carried a hundred supernumeraries at the time of the engagement.

COMPARATIVE FORCE AND LOSS.

<i>L'Insurgente</i>	40	791	409	29	41	70
				Time, 1 h. 14 m.		

It again fell to the lot of the *Constellation* to demonstrate the superiority of the American frigates over "any single European frigate of the usual dimensions," for early on the morning of February 1, 1800, nearly a year after her action with *l'Insurgente*, while cruising fifteen miles west of Basseterre, she gave chase to a sail that appeared to the southward. This at first was thought to be a merchantman, but on closer inspection it was found to be a heavy French frigate. Orders were immediately given to sling the yards with chains and to clear the ship for action. Towards noon the wind became light, thus enabling the stranger to hold his distance, which was nearly hull down to the south. In this relative position the two frigates remained for twenty-four hours waiting for a breeze which would enable them to maneuver.

At one o'clock Sunday afternoon, February 2, the wind freshened so that by setting every inch of canvas the *Constellation*, by eight o'clock in the evening,¹ succeeded in getting within gun-shot. Captain Truxtun then hoisted his colors, lighted his battle lanterns, and soon after stepped to the gangway to hail. At this moment the stranger opened fire from her stern-chasers and quarter-deck guns. The *Constellation* did not immediately reply, but, reserving her fire until she had secured a position on the Frenchman's weather quarter, opened with deliberate and destructive broadsides. The stranger directed his fire at the *Constellation's* rigging, while the latter aimed at the Frenchman's hull. In this manner the two frigates

ran along, side by side, with little or no maneuvering, for nearly five hours, keeping up a spirited cannonade.

Towards midnight the Frenchman's fire slackened, and by half-past twelve became silent. By this time the *Constellation's* rigging, sails, and spars were terribly cut up, although her hull was comparatively uninjured. It was now ascertained that the mainmast was unsupported, every stay and shroud having been carried away. The men were immediately called from the guns to meet this great danger. But it was too late, for a few minutes later the mast went over with a crash, carrying the topmen and Midshipman James Jarvis with it. This young officer, although warned by a gray-haired seaman of the critical condition of the mast, refused to leave his post and perished with his men.

Every effort was made to clear the wreck, and in an hour's time the frigate was again after her antagonist. The Frenchman, however, having sustained comparatively little damage in his rigging, had improved this opportunity to make his escape, and by the time the *Constellation* was again under way he had disappeared in the night. There being no trace of the enemy at break of day, Captain Truxtun made for Jamaica to repair damages. It was afterwards learned that the stranger was the 40-gun frigate *la Vengeance*, Captain A. M. Pitot.

During the following August, or six months after this encounter, *la Vengeance* was captured by the British frigate *Seine*, Captain David Milne. She then carried 28 long 18-pounders on the main deck, 16 long 8-pounders on the quarter-deck and fore-castle, and 8 short 36-pounders, making in all 52 guns and 994 English pounds of metal. Since her action with *l'Insurgente* the *Constellation* had exchanged ten of her long 12-pounders for 24-pound carronades — the first, it is believed, ever used in our navy. Her 24-pounders also had been replaced by 18-pounders. Her armament then consisted of 28 long 18-pounders on the main deck, 12 long 12-pounders, and 10 short 24-pounders on the quarter-deck and fore-castle, in all 50 guns, aggregating 888 pounds of metal. Out of her crew of 310 she lost 14 killed and 25 wounded.²

Captain Pitot does not definitely state his losses, merely saying, "In consequence of the action I was so much damaged in my rigging that I was forced to return to the port of Curaçao, working to bend new sails on the stumps of the masts which remained, by means of which we were enabled to reach the port on the 18th of the same month." The regular complement of a French 40-gun frigate was

¹ Official report of the French commander.

² Official report of Captain Truxtun.

THE "BOSTON" RAKING "LE BERCEAU."

330 men. As the *Constellation* directed her fire principally at the enemy's hull, their loss in killed and wounded was very severe. According to American accounts it was 50 of the former and 110 of the latter.

COMPARATIVE FORCE AND LOSS.

Time, 5 hours.						

Captain Pitot's official report of this action is as follows:

CURAÇAO, year 8.

A. M. PITOT, captain commanding the frigate *la Vengeance* of the French Republic, to the Minister of the Marine and Colonies:

CITIZEN MINISTER: I have the honor to send you an account of two actions I have had on the 12 and 13 Pluviose with an American frigate which attacked us at eight o'clock in the evening in latitude $15^{\circ} 17'$ N. by $66^{\circ} 4'$ longitude west of Paris, and fought at first under the English flag and then the American. I am ignorant of its name. The examination I was made

to pass before the Governor of Curaçao, and from all the information that I have been enabled to procure, leads me to believe that the action took place with the *Constellation*, frigate of the United States, of sixty cannons and having 500 men as a crew. She had 24 and 18 pounders in her battery, and 12-pounders upon her quarter-deck.

You will see, Citizen Minister, what has been my conduct on this occasion; everything showed me that I must avoid an action in the position I was in, and must limit myself to the defensive. I acted in consequence. After having in the first action dismantled my antagonist, I put on sails and continued my course. As to him he could have attacked us in daylight, but he did not do so, preferring to attack at nightfall, and after having been forcibly repulsed he returned to the charge. The action was very exciting. In consequence of the action I was so much damaged in my rigging that I was forced to return to the port of Curaçao, working to bend new sails on the stumps of the masts which remained, by means of which we were enabled to reach the port on the 18th of the same month.

I was very well received here by the governor and the commandant of the Marines. Each of my

officers fulfilled his duty with honor, courage, and talent, and I must express very great satisfaction with their conduct. I have too much confidence in the justice of the Government to believe that it will be necessary for me to enter into their individual actions to satisfy the Government. But I cannot forego this pleasure. I will speak with all the more praise for them as it is the second action in which the great part of them participated in *la Vengeance* in the space of ten months.

[Signed] A. M. PITOT.

As we have seen, Captain Pitot reports the *Constellation* as a "frégate des États-Unis de 60 canons et ayant 500 hommes d'équipage." It is hardly necessary to show the error of this statement. It will be observed, however, that no ship in the United States Navy, up to 1814, carried more than 56 guns, and not even the heaviest as many as 500 men. That the 36-gun frigate *Constellation*, under cover of night, should have induced Captain A. M. Pitot to believe that he was fighting a frigate of 60 guns, manned by 500 men, is the best possible acknowledgment of the efficiency of the ship and of her crew.

The official report of the third action between American and French cruisers in this war shows it to have been one of the most remarkable struggles in naval history. Cooper in his account of this affair merely states that the *Boston*

was directed to cruise a short time, previously to going on the Guadaloupe station again, between the American coast and the West India islands. While in the discharge of this duty, November, 1800, in latitude 22° 50' N. and longitude 51° W., she made a French cruiser, which, instead of avoiding her, evidently sought an encounter. Both parties being willing, the ships were soon in close action, when, after a plain, hard-fought combat of two hours, the enemy struck. The prize proved to be the French corvette *le Berceau*, Captain Senez, mounting 24 guns, and with a crew a little exceeding 200 men. *Le Berceau* was much cut up, and shortly after the action her fore and main masts went. Her loss in killed and wounded was never ascertained, but from the number of the latter found in her it was probably between 30 and 40 men. Among the former were her first lieutenant, master, boatswain, and gunner. The *Boston* mounted 8 more light guns than *le Berceau*, and had about an equal number of men. She had 4 killed and 11 wounded. Among the latter was her purser, Mr. Young, who died of his injuries. *Le Berceau* was a singularly fine vessel of her class, and had the reputation of being one of the fastest ships in the French marine. Like the combat between the *Constellation* and *l'Insurgente*, the superiority of force was certainly in favor of the American ship on this occasion, but the execution was every way in proportion to the difference.

According to the French official account of this action, the battle lasted not two hours

only, but twenty-four hours, and was one of the most desperate encounters of that period. Owing to the death of Captain Senez and his first lieutenant, the next officer in rank, Second Lieutenant Clément, was officially examined, of which examination the following official record was made:

Extract from Register F., folio 159, of the "Chancellerie du Commissariat des relations commerciales" of the French Republic at Boston.

To-day, 17th Frimaire of the year 9 of the French Republic, before midday appeared before me, Albert Salleron, chancellor pro tem. of the said Commissariat in the chancery of the commissariat of commercial relations of the French Republic at Boston, Citizen Louis Marie Clément, second lieutenant of the Republic's sloop *le Berceau* of twenty-two pieces of cannon, 8-pounders, and two howitzers, commanded by Citizen André Senez, frigate captain, who made before me the following declaration:

"That the 20th Vendémiaire 9 year [12th of October, 1800] *le Berceau* sloop, Captain Senez, sent from Cayenne on a cruising expedition, the 5th completing day of the year 8 [September 17th, 1800], by the agent of the Cayenne, having for a "spy" the schooner *l'Espérance*, Captain Hammond, reckoning 22° 47' latitude N. by 49° 20' longitude W. of Paris, variable winds east-northeast by southeast, fresh wind, fine sea. At five o'clock in the morning we noticed a sail before us at a league and three-quarters' distance. Immediately we signaled the schooner to the southeast and let it come up a little. A short time after we found out that the vessel we had sighted was a large war vessel. We at once put about and signaled the schooner to do the same. A moment later she imitated our actions. At six o'clock the vessel, which we found to be a frigate, was in our wake, the schooner being a little to windward of us. At half-past six a general and decided rallying was signaled to the schooner. At this time the frigate had the wind and chased the schooner, which at once took the wind on the starboard tack. At this time we let the schooner approach us; the frigate hugged the wind, but the schooner gained on her. At eight o'clock the frigate, seeing that she could not overtake, we let her approach us. We then went to the windward, knowing that this was the best point of sailing for fore and aft rigged vessels like ours.

"At ten o'clock the schooner had disappeared, the frigate was still chasing us and was gaining a little. By eleven o'clock she had gained still more, and at noon we perceived that she had a decided advantage over us, upon which we relieved our ship by throwing the anchor overboard. The frigate was now about a league behind us. At half-past twelve their advantage being more obvious, we threw overboard many articles which might impede our progress, and at two o'clock the frigate, having gained considerably on us, we threw overboard what remained of the ballast, also the second boat and the spare masts, except the extra topmast.

"At half-past three o'clock the frigate hoisted the American flag and pennon and fired twice. We at once hoisted French colors and pennon and an-

swered by a single cannon shot. The frigate at a quarter to four, being within speaking distance, asked us from whence we came. 'From Cayenne,' replied the captain. 'Where are you going?' 'Cruising.' 'Strike your flag.' 'Never!' replied the captain. A moment later she fired on us, and ranging along our starboard side, within pistol-shot, the battle began in a most spirited manner on both sides. The musketry was very sharp and well sustained, the only delays being to reload the pieces. The battery also was served with the greatest activity, and the cry of 'Vive la République' was often heard during the battle.

"At six o'clock our mizzen topgallant-mast and topmast were seriously wounded, the shrouds cut through, and the yards, sails, and lower masts riddled with shot. At five minutes of six o'clock the frigate dropped astern, having her topmast cut through and fallen. We hauled up our courses and held the wind as well as we could. The frigate from this moment ceased firing, and we worked without ceasing at repairing damages.

"At half-past eight o'clock the frigate again attacked us and we discharged a broadside. From that time the action was renewed with great ferocity at pistol-shot. At half-past nine o'clock the captain, seeing a favorable opportunity of boarding the frigate, gave the order, and the crew only awaited the chance and our vessel manœvered to favor the attempt. The frigate, however, took care not to allow herself to be boarded, and the action continued at pistol-range up to eleven o'clock, when the frigate again hauled off to repair damages. We also hauled up our courses; a short time after which our jib-boom broke, also the topmasts fell on the forward deck. At this time our shrouds and backstays were nearly all cut through, and the two square topmasts had also been cut upon our two gibbets. We therefore found ourselves without the possibility of repairing, but we nevertheless made as much sail as we could. The frigate also was much damaged in her sails and topmasts, and she remained out of gunshot but always in sight.

"At five o'clock the next morning nobody had yet left his post and we expected every moment a third attack, when the frigate passed us to the starboard at a great distance and placed herself to windward of us at half a league's distance. In the course of the morning we saw that she was working at repairs. At half-past eleven o'clock our foremast, pierced with shot, fell to the starboard, and a short time after the large mast fell also. At two o'clock in the afternoon the frigate, which had now finished

repairs, came up to us on the starboard side. Our captain then assembled the council necessary in such cases. All that were called to the council thought that the dismasted ship, having its battery entangled with the fallen masts, many shot below the water-line, which already caused her to make seven inches of water in the hold, as well as a number of other serious damages, could no longer keep up the combat against the frigate without wasting the lives of those yet alive and who were now so situated that there was no possible means of defending themselves to advantage. Moreover, that the honorable manner in which they had fought had sufficiently proved how much they had had to heart to preserve to the Republic the sloop which had been confided to their care, but having done all that was possible to prevent its capture they ought to give in to superior forces. It was then unanimously decided that without making any more resistance the flag should be hauled down. Accordingly it was struck at once, and immediately after the frigate sent a boat to take possession. We then found the frigate to be the frigate of the United States, the *Boston*, of 24 12-pounders and 12 9-pounders commanded by Captain George Little.

[Signed]

CLÉMENT,
SALLERON.

"Four killed and seventeen wounded. Seven hundred cannon shot expended and two thousand and one hundred musket shot."

The *Boston* was a corvette, and carried 24 long 12-pounders and 12 long 9-pounders, making a total of 36 guns with 396 pounds of metal, not allowing for deficient weight in American metal. Out of a crew of 230 she lost 4 killed and 11 wounded. *Le Berceau* mounted 22 long 8-pounders, and 2 short 12-pounders, in all 24 guns, making 216 English pounds of metal. Out of a crew of 220 she had 4 killed and 17 wounded.

COMPARATIVE FORCE AND LOSS.

	Guns.	Lbs.	Crew.	Killed.	Wounded.	Total.
<i>Boston</i>	36	396	230	4	11	15
<i>Le Berceau</i>	24	216	220	4	17	21

Le Berceau was taken to port and refitted, and on the ratification of the treaty with France, February 3, 1801, she was returned to their navy.

Edgar S. Maclay.

YESTERDAY.

LORN yesterday
Came back to say,
"Let me a shadow be,
A shade, if nothing more,
To follow faithfully
The days that go before."

I could but say,
"Sweet, have your way";
And so the gone day clings:
Since pleasures are too few,
Why lose the old sweet things,
Though sweeter prove the new?

John Vance Cheney.

THE PRINTING OF "THE CENTURY."

HERE was a general belief twenty years ago that the materials, methods, and machinery of magazine printing had nearly reached full development. Old publishers and printers said that it was unreasonable to expect better paper or finer presswork; it was absurd to hope for higher results by changing the methods of printing which had been sanctioned by long experience. Most emphatically was the proposition laid down that fine printing could not be done with speed or at low cost. If finer paper were wanted, that paper must be of superior fiber and hot pressed, at a price necessarily prohibitory. It was folly to talk of better engraving. The London school of engravers had already reached the high-water mark of close wood-cutting; but while they had fully shown their ability to cut finely, printers had signally shown the inability of printing machinery to print their blocks properly. The "Penny Magazine," useful and meritorious as it was in many features, was a warning of the folly of attempting to print good woodcuts on cylinder presses. Designers of merit had refused to draw upon blocks that would be spoiled in printing. Some of the abler engravers had abandoned the practice of engraving on wood in despair at the unworthy reproduction of their best efforts by the printers.

The printing trade here had made similar experiments and had reached the similar conclusion, that fine printing can be done only on the hand press. English writers on engraving had oracularly declared that the province of engraving on wood was limited to the delineation of form only; that it could acceptably produce light and shade only in a conventional style; that it was presumptuous for an engraver on wood to attempt any serious deviation from the outline style of Dürer and Holbein.

Whoever looks over the bound volumes of illustrated periodicals between 1850 and 1870 cannot fail to note the depressing influence of this experience and of these teachings as shown in the flatness and muddiness of woodcuts in which the engraver had made, or tried to make, nice distinctions of light and shade, and the coarseness and scratchiness of a more open style of cutting in which the engraver had servilely followed the lines of the designer. Every designer and every engraver was ham-

pered in his work by apprehensions that the block would not be properly printed.

The publishers of *THE CENTURY* had to prepare their first number, of November, 1870, upon the mechanical track laid down for them by the printing trade. The only available form of printing machine that met the conditions required was an improved form of "drum-cylinder," on which fair presswork might be had if the pressman was very skillful. The publishers were warned that cylinder presses were type smashers, sure to damage fine engraving. This prophecy failed. The careful adjustment of pressure by means of overlays prevented excessive wear, but there was a lack of sharpness of line and brightness of color in the prints from the woodcuts, as there always must be when impressions are taken against the elastic resistance of a rubber cloth or blanket. To limit the force of impression to the flat surface of a woodcut, to prevent the overlapping of pressure on the edges and sides of engraved lines, one must print against a hard inelastic impression surface. On small jobbing presses this method of getting sharp impressions had been in use for many years. Why not try it on the magazine? This called for another change. Of what use to prepare an inelastic impression surface when the paper to be printed was made elastic and spongy by dampening? To get sharp, clean lines, the paper must be printed dry. Old pressmen shook their heads at this innovation, and said it could not be done. But it was done. At first not with complete success, but well enough to show the possibilities of excellent results when the pressman had full mastery of the details of the new method.

This change called for still another. The ink was now in fault. Ink that was good for damp was not good for dry paper. This seems a petty obstacle; but many kinds of ink had to be compounded and many trials made before the ink could be furnished that had the needed blackness, that spread itself fairly on the types, and that dried quickly on the paper.

The success of the new method warranted the publishers in attempting a higher grade of illustrations. Some of them were too difficult to be properly done on the drum-cylinder press, which did not have inking facilities or strength enough to face them fairly. The better machine that was needed was found in the newly developed "stop-cylinder printing machine,"

which promised the needed strength and inking facilities. This stop-cylinder did better presswork, but at slower speed and at greater cost, yet its capacities were often seriously overtaxed by the close and shallow engraving furnished by engravers who were striving to reproduce with picks or lines the effective tints of designs made entirely with the brush. The woodcut which could be made to give one fair proof after an hour of manipulation on the part of the engraver could not be made to give a proper print on the press from its electrotyped duplicate at the required rate of twelve copies a minute. The shallowness of the counters of these cuts was so slight that the cut itself seemed perfectly flat. Shallow as this counter was, it was often made more so by the process of molding and electrotyping. It was necessary to improve the quality of the electrotype plates. Repeated experiments led to no new discovery, nor to any radical change in methods, but they did compel the purchase of improved machinery, and did induce habits of nice observation and attention to trifles, which were of marked benefit.

The greatest obstacle to the perfect printing of woodcuts always has been the uneven surface of printing paper. If the reader will look through a magnifier at a sheet of ordinary paper, he cannot fail to note that the surface is uneven—broken in every direction with little pits or depressions. Paper is but a felting or tangle of interlaced fibers which make the sheet thickest in the places where the fibers cross each other with a corresponding unevenness of surface. When printed on ordinary types that have deep counters, these pits or depressions are too shallow to affect the print. If the paper be dampened, the supply of ink full, the impression strong, and the impression surface elastic, the type will sink to the bottom of these depressions without any noticeable thickening of line. Under these conditions no one can see any lack of smoothness in the print. But these are not the conditions under which fine woodcuts can be rapidly printed. The paper must be dry and smooth; the impression must be confined to the surface; the lines must not be jammed in or unequally sunk below the surface of the paper.

The old approved method of smoothing paper was by pressing each sheet through hot plates—a process which made the vellum, or hot-pressed paper, so much admired twenty years ago. But this process was slow, uneven in results, and too expensive to be considered for magazines. The American method of smoothing a sheet in a web by passing it through stacks of calendering rollers was adopted from the beginning of the magazine, but it had disadvantages. Great pressure was

required to make the sheet smooth; but if the pressure was too great the fiber was crushed, the paper became transparent and so hard that it would not properly receive and retain ink, the surface became shiny, waxy, and irritating to the eye.

The only way to make paper smooth enough for the work was to fill these pits or depressions while the paper was in the process of manufacture with a soluble filling which made an absolutely uniform surface readily smoothed by the calendering rollers. The amount of this filling is small; the effect it produces on the print is great. The delicacy of line and tint shown in the engravings of the last five years could not have been reproduced with even a tolerable degree of faithfulness if they had not been shown on this surfaced paper. The new form of mechanical engraving, commonly known as the half-tint style, is equally dependent for its effect on surfaced paper. No other paper can show with such clearness the whole scale of color from the palest gray to the intensest black.

The changes that have been recently made in the theory and the processes of printing will perhaps be more clearly understood by an examination of the methods and machinery now used for the printing of *THE CENTURY MAGAZINE*.

Printing begins with type-setting, which is done now as it was four hundred years ago. Every letter must be picked up by hand and adjusted by human fingers to its fellows. For good book-work there is as yet no short cut, no royal road. There are, it is true, type-setting machines doing efficient service on daily newspapers, and others that give good promise of usefulness in the more exacting branch of book-work, but they have not curtailed the employment of the four thousand compositors who set type by hand in this city. Type-setting by hand is slow work. A quick workman can set five columns of *THE CENTURY* in a day of ten hours; but the performance of the average compositor does not exceed, hardly reaches, two pages a day. The composition of the magazines is done by young women, whose work is as accurate and acceptable as that done by men. The women are paid the same rates as men.

A large printing house needs many types; there must be many kinds, and a great many of each kind. In this printing house the types and the appurtenances for keeping them in order occupy two large floors, each of about seven thousand superficial square feet. Not one-tenth of this type is in daily use, but all of it is needed, for any kind may be demanded and must be accessible at a moment's notice. Each face or style of type, and each character or

ENTRANCE TO THE DE VINNE PRESS.

type of that face, must have its place, and be kept in that place.

The compositor who works on *CENTURY* copy stands before two inclined cases containing boxes for characters in roman type; she picks types out of the case without examination, and puts them into a "stick," which is a small iron tray carried in her left hand. When the stick is filled with lines of type she puts these lines on a "galley," which is a long tray of brass. When the galley has been filled with type a proof of its contents is taken on a rolling press. Now the proofreader begins his work, by silently reading the proof as he follows the voice of the copy-holder, who slowly reads aloud from the copy used by the compositor for setting this type. If any letter or word has been omitted or misspelled the fault is noted and marked. The marked proof goes back to the compositor for correction, which is done. A new proof is then taken and revised, and sent to the editor or the author. The return of this proof contains editorial corrections, and usually the order to "make up,"

VOL. XLI.—13.

which means to rearrange the long strip of types on galley in the form of pages with their appropriate illustrations.

These woodcut illustrations are the jewels of the magazine. How frail they are! how tenderly they have to be cared for! A careless thump or scratch, neglectful exposure to too much heat or dampness, and their beauty is marred forever. To prevent losses by these accidents, every woodcut is proved on the hand press soon after its receipt, and a mold taken in beeswax on which an electrotype shell is deposited. These shells weigh less than an ounce, and are carefully preserved and used only in case of an accident to the woodcut. The proofs of the cuts are sent to the foreman of the press-room, who uses them for his "overlays," of which more will soon be said.

After proving and molding the cuts are sent to the maker-up, who frequently finds them quite obdurate and inflexible — too long, too short, too irregular, rarely ever adapted to the places for which they were made. To find the proper place for each cut, and make it fit there, is

THE VESTIBULE.

a part of his business which calls for patience and ingenuity; but the author or the editor lends his help, and the work is done. Then follows another proof, which is read by a new reader, and is marked with more corrections. Perhaps another proof still; but finally comes the editor's seal and stamp of approval — *Cast* — and off go chase and contents to the electrotype foundry.

When made up the pages are fastened in square frames of iron that are called chases, which allow them to be transported to the foundry, or to be kept securely waiting orders for correction or alterations. Many pages have to be kept in type; some of them wait but a few days, others for months before the order comes for casting. For the text of *THE CENTURY*

five thousand pounds of type are provided, and all of this is often used.

Let us follow the chases of type, securely nested in boxes to prevent bruising, to the electrotype foundry on the sixth floor. This is the one room that cannot be kept bright. The furnace, the machines, the batteries, and the pervasive atoms of black-lead floating through the air are sad hindrances to neatness. The types, apparently clean enough, are carefully washed, and then dusted with these atoms of black-lead. The chase of type is now put in a molding press and pressed with great force against a plate covered with a thin sheet of wax that has been coated with the black-lead. This material prevents the wax from sticking to the form in the operation of molding, and also acts as a con-

ductor of electricity on the non-conducting surface of the wax mold. It is not a cleanly or a pleasant material to handle, but there seems to be no other available substitute. The pressure on the wax gives a minutely faithful but reversed duplicate of the face of the type. The mold is next submerged in a vat of turbid fluid which seems innocent and peaceful enough, but in it mysterious forces are noiselessly at work. Put a key or any bit of iron against two of the rods on which the mold is suspended and you instantly see a shower of electric sparks. The buzzing little dynamo in the corner by its rapid revolution is sending through the fluid an electric current which liberates particles of copper from the solution in the bath and attaches them to the mold. In impalpable atoms, finer than can be made by heat of fire, these minute copper particles travel through the solution to their destination. After a few hours of

tinfoil is melted, which serves as a solder for the melted electrotpe backing metal that is poured over it, making a plate about one-fifth of an inch thick. When the plate is cool it is put under a planing machine and reduced to a thickness of about one-seventh of an inch. A screaming, vicious-looking little circular saw now takes the plate and trims off the rough and superfluous metal on the edges, after which the plate is straightened perfectly level and shaved to the desired thickness. Next comes the beveler, a form of side plane which makes the angled shoulders required by the clamps which are to hold it on the press. Now the finisher takes up the plate and scrutinizes it for the correction of trivial defects. Then a proof is taken and compared with the type proof.

MACHINE FOR SHAVING WAX CASES FOR MOLDING.
IN THE ELECTROTPE ROOM.

exposure lift the wax mold and you will see it covered with a thin shell of bright copper about as thick as a sheet of ordinary writing paper. This shell is the duplicate of the face or surface of the types and woodcuts in the chase. It is too thin to be used for printing: it must be "backed up" and mounted.

A jet of steam or hot water is next applied to the deposited copper shell, which melts the underlying wax and permits the shell to be relieved from the mold. On the back of this shell

ROUTING MACHINE.

Unlike the type, or the frail woodcut which may be in the page, this electrotpe plate can receive a hundred thousand impressions, or more, without loss of beauty or sharpness. It can be handled, packed, and transported with more ease and greater safety than the type or the wood. The page of type costs, composition included, about seven dollars; a full page of woodcut costs from one hundred to two hundred dollars. The electrotpe of either costs less than one dollar. These are the reasons why electrotypes are made.

The electrotpe foundry is a miniature machine shop, with machines on every side—to plane, to saw, to bevel, to rout, to mold, to melt, to carve. One of the peculiarities of this room is a little machine which bevels both sides

IN THE PLATE VAULT.

of a page at one operation, by means of circular beveled cutters, insuring an accuracy as to size not to be had when the beveling is done by hand, and by two distinct operations. The shaping machine, with its gas heater and air blast, which curves a flat plate to fit the periphery of the printing cylinder of the web press, is another novelty. There again is a newer apparatus for bending to a true curve plates of cold metal, the invention of the foreman of the room, which produces a curved plate of still smoother and truer surface. The difference between a fairly smooth and a truly smooth surface may seem trivial, but on this trifle depends the success of fine printing on a rotary press.

The inspection of the plate does not end with the finisher, for a new proof of it is taken on the hand press, and its face is carefully searched for the hidden defects of air bubbles under the shell, bruised letters, or uneven surfaces. If the defects cannot be economically remedied the plate is condemned and a new one is ordered.

Plates that have to be printed in red ink, like the cover of "St. Nicholas," or that will have to receive unusual wear, like the advertising pages of *THE CENTURY*, are coated with

a film of nickel, which resists the scaling of the ink or the wear of the press. For special purposes a film of steel can be substituted.

The plates that are passed as ready for press go to the plate vault, the only place in the building in which gas burns all day. Between solid piers five feet thick are here piled, tier after tier and row after row, many tons of boxed plates. Each set of thirty-two plates is in a specially labeled box, and each has its place on a range of shelves which extends backward in impenetrable gloom. All are readily accessible to the plateman: at five minutes' notice he will furnish any plate that may be called for. It is his work not only to keep the plates in order on the shelves, but to get them in order for the presses. The plates have to be mounted by him on movable blocks; to be firmly fixed in chases so that they cannot be disturbed by the action of the machine; to have their margins nicely adjusted, and their positions so determined that they shall be printed properly on the paper, and folded and cut with exactness.

One of the most attractive portions of the press department is the vault—a long room under the sidewalk on Lafayette Place, beautifully lighted by the bulkhead of iron and glass sixteen feet overhead. At the end of a long row of machinery stands the web press

REWINDING PAPER.

—a massive and complicated construction, specially built by Messrs. R. Hoe & Co. for printing, cutting, and folding the plain and the advertising pages of *THE CENTURY*. Web presses for newspapers are common enough, but this press has distinction as the first, and for three years the only, web press used in this country for good book-work. At one end of the machine is a great roll of paper more than two miles long when unwound, and weighing about 750 pounds. As the paper unwinds it passes first over a jet of steam which slightly dampens and softens, but does not wet or

sight. Pulleys at once seize the creased sheet and press it flat, in which shape it is hurried forward to meet three circular knives on one shaft which cut it across in four equal pieces. Disappearing for an instant from view, it comes out on the other side at the upper end of the tail of the press in the form of four-folded sections of eight pages each. Immediately after, at the lower end of the tail of the press, out come four entirely different sections of eight pages each. This duplicate delivery shows the product of the press to be at every revolution of the cylinders sixty-four pages, neatly printed,

THE WEB PRESS FOR PRINTING AND FOLDING SIXTY-FOUR UNILLUSTRATED PAGES AT ONE REVOLUTION.

sodden, its hard surface, and fits it for receiving impressions. It next passes under a plate cylinder on which are thirty-two curved plates, inked by seven large rollers, which print thirty-two pages on one side. Then it passes around a reversing cylinder which presents the other side of the paper to another plate cylinder, on which are thirty-two plates which print exactly on the back the proper pages for the thirty-two previously printed. This is done quickly—in less than two seconds—but with exactness. But the web of paper is still uncut. To do this it is drawn upward under a small cylinder containing a concealed knife, which cuts the printed web in strips two leaves wide and four leaves long. As soon as cut the sheets are thrown forward on endless belts of tape. An ingenious but undetectable mechanism gives to every alternate sheet a quicker movement, so that it falls exactly over its predecessor, making two lapped strips of paper. Busy little adjusters now come in play, placing these lapped sheets of paper accurately up to a head and a side guide. Without an instant of delay down comes a strong creasing blade over the long center of the sheet, and pushes it out of

truly cut, and accurately registered and folded, ready for the binder. Two boys are kept fully employed in seizing the folded sections and putting them in box trucks, by which they are rolled out to the elevator, and on these sent to the bindery.

This web press is not so fast as the web press of daily newspapers, but it performs more operations and does more accurate work. It is not a large machine, nor is it noisy, nor does it seem to be moving fast, but the paper goes through the cylinders at the rate of nearly two hundred feet a minute. It does ten times as much work as the noisier and more bustling presses by its side. Made especially for *THE CENTURY MAGAZINE*, it prints that and nothing else, for its large regular editions keep it fully employed. The reprinted numbers of *THE CENTURY* and all the other publications of The Century Co. are done on other presses. This web press has other limitations: it is not at all an economical machine for small editions, nor can it be successfully used for the fine woodcuts of the illustrated articles of *THE CENTURY*. The pages that contain these woodcuts, and the entire text of the "St. Nicholas," hitherto have been done on a slower

and smaller machine known as the stop-cylinder, which prints sixteen pages only on one side of a sheet at the rate of about 750 impressions an hour. One machine can produce in one month but a small portion of the illustrations required for the magazine. It follows that there are many of these stop-cylinders, and that the printing plates are made in duplicate and sometimes in triplicate, and, to get out the edition in time, that these duplicates go to press on different machines. To get the

feeders from single sheets in the usual manner, and does the work of four stop-cylinders in superior style. The gain in performance is not as great as the gain in quality of presswork, but quality was considered more than speed. The performance of the machine could have been more than doubled by adding to it other cylinders which would print on both sides of the paper; but careful experiment has proved that the finest woodcuts cannot be properly printed with this rapidity. To get the best

THE NEW ROTARY PRESS FOR PRINTING SIXTY-FOUR ILLUSTRATED PAGES AT ONE REVOLUTION.

superior quality of presswork demanded this delay in performance and this multiplication of machines has been submitted to for many years.

Encouraged by the success of the web press in magazine presswork, the printers of *THE CENTURY* have applied the rotary principle to a new machine for fine illustrations, expressly made for them by Messrs. R. Hoe & Co. and but recently put to work. Sixty-four plates of *THE CENTURY*, truly bent to the proper curve, are firmly fastened on one cylinder sixty inches long and about thirty inches in diameter; sixteen inking rollers, supplied with ink from two ink fountains, successively ink these sixty-four plates with a delicacy and yet with a fullness of color never before attained. The shafts of the impression cylinder and the plate cylinders, $4\frac{1}{2}$ inches in diameter, do not spring or give under the strongest impression. Although rigid in every part, in the hands of an expert pressman it can be made responsive to the slightest overlay. This machine is fed by four

results the ink on one side of the paper must be dry before it is printed on the other side.

These are the presses on which the skill of the overlayer is most signally shown. The theory of overlaying may be explained by this diagram:

Suppose A B C D to be separate hand stamps engraved on wood. If the surface of the stamp marked D were inked the moderate pressure of ten pounds would transfer these thin lines to paper. C, having more lines, and offering more resistance, would call for a pressure of twenty pounds or more to insure a good print. B is still blacker, and resists much more, requiring say fifty pounds to force it fairly. A, which is entirely black, could not be smoothly printed

THE PRINTING MACHINES IN THE VAULT.

with a pressure of less than one hundred pounds — perhaps more. If the pressure of ten pounds were put on each square, B and C would show weak and ragged lines, while A would be blotched all over with irregular gray spots. If the pressure were made one hundred pounds or more, the lines of B and C would be hard and muddy, and D would be worn out before one hundred impressions had been taken.

Overlaying is merely an intelligent adjustment of pressure on woodcuts — a pressure adjusted to suit the resistance, so that light lines shall have little and solid surfaces much pressure. So treated, light lines will print sharp and clear; the compact and closer lines of middle tints will be smoothly gray, and the solid portions of the dark shadows will be full velvety black. The different degrees of light and

shade in every woodcut require this graduation of pressure. The theory seems simple enough, but putting the theory in practice is not. Every printing machine is made so that the pressed and the pressing surfaces shall be in exact parallel — so that pressure shall be absolutely uniform in every part. If woodcuts were like the ordinary text-types of books and newspapers in their equality of color and their equal resistance to impression, there would be no need of overlaying; no more pressure would be required in one portion than in another.

STOP-CYLINDER PRINTING MACHINES.

But woodcuts are conspicuously unequal—the thin lines, the close lines, the solid blacks, are irregularly combined. Yet each must have a different degree of pressure. On simple diagrams, like A B C and D, the result desired can be reached by pasting one or more thickness of paper over C, two thicknesses over B, and three or four over A. Adding thickness to the pressing surface gives the additional pressure. On a woodcut in which light and shade are intermixed the work is extremely difficult—not to be explained by words; to be learned only by experiment and the study of repeated failures. The rarity of well-printed, and the commonness of badly printed, woodcuts are indications of the difficulty of the art.

This floor and the floor above are filled with

HYDROSTATIC DRY-PRESSING MACHINE.

large presses, and the air trembles with their busy hum. All day long belts are spinning, heavy forms of type swing to and fro on their carriages, and sheets of paper are sweeping down the revolving cylinder and dancing out on the fly-fingers. Every one is busy. There are no idlers, but no one is in a hurry. Yet the piles of sheets that go to the elevators every hour prove that work is done with good result. The only machines which do hurry are the heavy elevator engines that start like race-horses when the porter pulls the rope. Let us try their speed, and go up again with boxes of sheets on the platform to the bindery, which occupies the eighth and a part of the seventh floor.

In no other part of the building are work and workmen so crowded. Folding and stitch-

ing are simple operations when done leisurely, but to do them quickly and well calls for many machines and many hands. Compact arrangement must be made and needless travel avoided. There should be no unnecessary carrying forward and backward of the six tons of paper which have to be moved every day from one part of the room to another. The folded sheets of the web press are brought up by the elevator in box trucks that can be easily rolled in any direction and are put before the dry-presses—compact little hydrostatic machines in which folded paper two feet thick is soon reduced in bulk one-fourth. The pressure is kept on the paper after it has been removed from the press, and it can be so kept for many days. These two presses, with two workmen, do more and better

work than could be done by a dozen hydrostatic presses of the old pattern. The illustrated forms are folded on machines specially made for the work, which fold and cut sheets of thirty-two pages and deposit them in four long trays in the form of four sections of eight pages each. All these sheets when folded are passed through the dry-presser and kept under pressure until they are perfectly flat, compact, and free from sponginess.

At this stage *THE CENTURY MAGAZINE* is in the form of twenty-five or more different sections of folded paper, scattered in as many boxes. The next process is to get them together in regular order. The magnitude of the task will be better understood when it is known that the sum total of these twenty-five or more pieces of folded paper in an ordinary edition of the magazine is never less than five million and in a large edition is often more than six million pieces. To put one piece out of its order is to spoil a copy—perhaps two copies. It is

necessary that the work be done with exactness, but equally important that it be done with speed. Under the old methods of gathering, the twenty-five sections were laid down in piles and in regular order on a long table, and the gatherers in slow procession walked beside it and picked up each section in turn. How many miles a gatherer walked in a day; how tired she was before the day was half over; how little she did, even when she did her best; how much room she occupied to the annoyance of other hands—need not now be computed. It is enough to say that gathering was always a hateful task to employed and employer. To lighten this work an ingenious Englishman, whose name is unknown to the writer, invented a circular or rotary gathering table, on which the paper

FOLDING MACHINES.

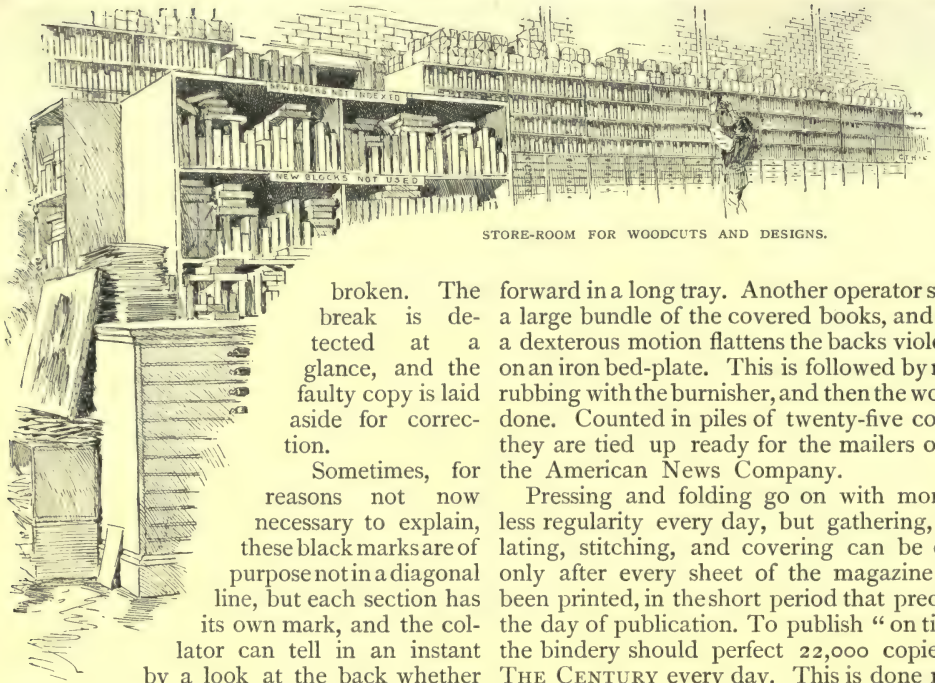

would travel to the gatherer, instead of having the gatherer travel after the paper. Here is the apparatus, which occupies a large space in the middle of the room. Around this table sixteen young women are seated, gathering the sections as they are successively presented. One can readily see that much more work can be done in a given time, in a smaller space, and with less fatigue.

The gathered sections are now passed to the collator, who rapidly examines them for faults.

If there be a section too much or too little, or a section out of place, the fault can be instantly detected. How is this done? Take off the paper cover on the back of the magazine and you will see that each section of the text has its own peculiar black mark on the back of the fold. These black marks are intended to be so arranged that they shall make a continuous black diagonal line on the back. If there should be one black mark too many, or one too few, the continuity and regularity of the black line is

REVOLVING TABLE FOR GATHERERS.

STORE-ROOM FOR WOODCUTS AND DESIGNS.

broken. The break is detected at a glance, and the faulty copy is laid aside for correction.

Sometimes, for reasons not now necessary to explain, these black marks are of purpose not in a diagonal line, but each section has its own mark, and the colator can tell in an instant by a look at the back whether the magazine is or is not perfect.

Stitching machines on the other side of the room now receive the gathered copies. Compared with other machinery these wire-stitchers do not seem overstrong, but note how swiftly and securely they drive and clench two staples of wire through more than half an inch of paper. The older readers of *THE CENTURY* hardly need the reminder that twelve years ago the work of stitching was done by a "stabbing machine," which punched irregular holes in the paper, through which a hand-sewer put needle and thread — a slow process, which made a spongy and shakily pamphlet. The wire-stitcher can readily perfect one thousand copies in an hour, and it does its work in a manner much more satisfactory to the reader.

Covering, the next process, is also done, to some extent, by a machine. The wire-stitched but uncovered magazines are put in order on a long tray, at one end of which is an automatic clasp, which takes them one by one at regulated intervals to the prepared cover. Each cover is accurately placed by hand before iron fingers, which carry it around a narrow rotating wheel, the edge of which, exactly the thickness of the back of the magazine, is covered with melted glue. As the cover passes around the wheel the inside of the back is covered with a film of glue. It is then carried to a place where the back of the stitched magazine drops exactly upon the glued back of the cover. Sudden and strong pressure on this back firmly unites the back to the cover, after which it is pushed

forward in a long tray. Another operator seizes a large bundle of the covered books, and with a dexterous motion flattens the backs violently on an iron bed-plate. This is followed by more rubbing with the burnisher, and then the work is done. Counted in piles of twenty-five copies, they are tied up ready for the mailers or for the American News Company.

Pressing and folding go on with more or less regularity every day, but gathering, collating, stitching, and covering can be done only after every sheet of the magazine has been printed, in the short period that precedes the day of publication. To publish "on time" the bindery should perfect 22,000 copies of *THE CENTURY* every day. This is done regularly, and the performance is often exceeded without strain. In this room, where the need of despatch is most urgent, are none of the ordinary indications of hurry. There is no running to and fro, no shouting or scolding, no feverish or frantic impatience. Every one works briskly, but no one works hurriedly.

At the elevator door the magazines separate

A WIRE-STITCHER.

—some to the American News Company, whose carts morning and afternoon stand before the door; others to the mail-room on the uppermost floor. Within a week they will be in thousands of homes on the American continent; in two weeks they will be on sale in every large European city; in six weeks at most they will meet each other, coming from opposite directions in Japan and Australia.

The mail-room and the store-room on the top floor have nothing noticeable in the way of machinery, but a good deal to show in the way of intelligent classification. Ask for any woodcut that has been printed within twelve years and you shall have it in a few minutes. To the ordinary observer these arrangements may not seem impressive, but every one who has

moderate price have been introduced that take a sharper impression and show cleaner grays and more vigorous blacks than can be had from impressions on the luxurious India and Japan papers. Easy working and durable black inks are as common now as they were scarce twenty years ago. Electrotypes plates are made of smooth surface, and are curved with unharmed lines, to fit the cylinders of rotary printing machines on which they produce presswork that fully meets the most exacting requirements. Last, but not least, the final pressing of the printed work, which makes a solid and shapely magazine, is done more quickly and more thoroughly by pressing in the fold than was ever done when the work was pressed in sheets. Some of these items

IN THE MAILING ROOM.

had much handling of such disorderly objects as woodcuts, proofs, copy, sketches, back numbers, will at once recognize the executive ability which has found a place for everything and which has kept everything in its place.

Twenty years is but a short interval in the chronology of an art that is more than four hundred years old, but a good deal has been done for the improvement of printing between the years 1870 and 1890. Cylinder presses have supplanted hand and platen presses in printing woodcuts and large editions of fine books. Dry paper has taken the place of damp paper. In many large printing houses the appliances for dampening have been abolished, or set aside to be used only for rough and hand-made papers. Smooth-surface papers of

may seem of trifling importance to the reader. Singly, they may be; collectively, they are not. Whoever compares the first number of this magazine with the latest, must admit that decided improvements have been made in magazine printing. In the literary workshop of which John Milton dreamed, "the pens and heads, sitting by studious lamps, musing, searching, revolving new notions and ideas," were those only who thought and wrote. Now, the thinkers have mechanical helpers. In machine shops and paper mills, in printing houses and electrotypes foundries, are other studious men equally busy in mechanical devices that aid the writers in realizing this dream of the "Areopagitica."

Theodore L. De Vinne.

ANDERSONVILLE STOCKADE AFTER THE WAR. FROM PHOTOGRAPHS TAKEN IN 1868.

ON THE ANDERSONVILLE CIRCUIT.

THE flank advance on Chattanooga and the battle of Chickamauga covered a month of forced marches, skirmishing, and fighting over mountains and through thickets of timber and brush, in rain and mud,

by night and day.

Crack! crack! "Surrender, you Yanks! Halt, there! Halt, or you are a dead man!" *Crack! crack! crack!* "Now surrender, you Yankee son of Yankee Doodle!"

Seated on the top of a staked and rider fence I looked along a rifle barrel into the pupil of the right eye of a Confederate as he hissed the words through his teeth. My companion had fallen dead at the first fire, and I saw that this fellow meant to shoot. My answer was conciliating.

"Have you pistol, watch, or greenbacks?"

"No — no, sir."

"Well, give me that hat." "Here, I'll take that ring." "That knife is mine." Our pockets went inside out, and I was more surprised when they began to exchange clothing with us. Some of our party who were better clothed than myself were forced to give up their blue coats and take butternut instead; also to give boots in exchange for dilapidated shoes. When the dressing and undressing had been completed, but for the arms in the hands of our captors you could not tell Yank from Confed. They forced us at the point of the bayonet to repair the railroad about Chickamauga, which had been burned during the battle. During these three days they gave us once daily a few ounces of meat with a pint and a half of meal. This latter we mixed with water and baked on a chip before a fire. The men who guarded us to Richmond had been in the thick of the fight, and their humane treatment in

contrast with that of the authorities at Richmond and the stockades was not forgotten. We were very hungry, and when the train stopped for wood they allowed us, after giving our parole, to break for the woods, where we found wild grapes and muscadines. At Atlanta we were searched by officers and relieved of such trifles as we had not previously given up, or such as by sleight of hand we were unable to secrete. They did not spare us our canteens, tin cups, and spoons. At Weldon we were surrounded by many persons of both sexes, who evinced much curiosity to learn what battles we had been engaged in and the circumstances of our capture. One elderly gentleman remarked: "Yankees can't stand up against our Southern soldiers. We whip you on every battle-field. Why, one of our boys—"

"Look-a-heah, old man," said one of our guards, "I can't have you talking to these men like that; you never saw a Yank with a gun in his hands; and — you! I tell you they were hard to ketch. Now you stand back!"

Passing under one of the wagon bridges that formed a railway crossing and which was covered with people, we were assailed with a shower of sticks and stones. On our arrival in Richmond, October 10, 1863, we were placed on the second floor of a tobacco building overlooking the river. Extending from the corner across the sidewalk was this sign: "Libby and Son, Ship Chandlers and Grocers."

To inhale some fresh air, I immediately seated myself in an open window and was drawn in by a fellow-prisoner or I should have been shot by an outside guard. A little later we were drawn up in line and counted, and then listened to a speech from a man whom I learned later was "young Ross." He stated that for fear we might bribe our guards it would be necessary for us to give up what

money, watches, jewelry, and pocket knives we possessed. We might, he said, keep what Confederate money we had, "but greenbacks and coin must be turned over, all of which will be receipted for and returned when you are exchanged. And now, gentlemen, step up to this desk and get your receipts; after which you will all be carefully searched, and anything that you have not turned over will be confiscated." It was surprising to see the amount of property that thus passed under Confederate control. I could not understand how so much had escaped previous seizure, but the sagacity of Mr. Ross brought it to light. It was never seen by the Yankees again.

We were soon removed to the "Smiths' Building," another tobacco factory. Here we were searched as before, but the game was now hardly worth the hunt. Our rations while in Richmond we estimated at two to four ounces of beef and six to eight ounces of good wheat bread. To supplement this we made counterfeit greenbacks, which we were sometimes able to pass on unsuspecting guards. Once by cutting out the figures from a ten cent scrip, and with a little blood gluing this over the figure one in a dollar greenback, myself and three comrades bought with this bogus ten-dollar bill ninety loaves of good bread, and it was the only time while I was in the Confederacy that I made a full meal.

The morning after this we were loaded into box-cars for "exchange"; but the train moved towards Danville, which, we learned later, was our destination. As we approached the Roanoke River it was dark and raining. I had succeeded in removing the cap from the gun of one of our guards, and attempting to do the same for the other found that his was not capped. So when the river was crossed and we had cleared the houses, three of us jumped from the moving train and escaped to the woods. After five days and nights of almost superhuman effort and intense suffering we were all recaptured and taken to Danville. While here our Government sent, under flag of truce, clothing, a blanket and an overcoat, for each of us. We learned of their arrival, and there was great rejoicing; but on looking out next morning we saw our guards pacing their beats wearing blue overcoats and carrying new United States blankets. They gave us a portion, however, and our condition was much improved; but Danville looked like a Union camp. I saw here a number of recaptured prisoners undergoing the torture of buck and gag; and once, when we had dug a large tunnel from the cellar, our rations were cut off for forty-eight hours, and we were all driven to an upper room, thus crowding four hundred men into space formerly occupied by two hundred. We

were herded thus for two days, one person being permitted to descend to the yard below, and not until his return could another go. Entreaties, threats, and curses were met with bayonets, and a scene of horror ensued not to be described. About a half-dozen who lay on the opposite side of the room from me forced a window and leaped to the ground below; but they were riddled with buck-shot and not one escaped. They brought in those who were not killed outright, and we dug out some of the shot the best we could; but our remnants of knives were poorly adapted to such work, and the operation was critical. A man near me held a can of soup through an opening in the window to pour off some of the bugs. He fell, with a bullet through him. He was not killed, but he had learned his lesson.

We reached Andersonville May 20, 1864. As I passed inside, the ground seemed entirely occupied. The stockade then contained eighteen acres and eight thousand men. On all sides I heard cries of "Fresh fish!" "Look out for the dead-line!" "You can't stop here; pass on: plenty of room down the hill." I walked down the slope to unoccupied ground. My feet sank into the yielding sand, and as I retraced my steps my footprints had filled with the slimy ooze from the hillside. I would not lie on such ground except as a last resort. On the farther side of the stockade, near the dead-line, I found a smooth-faced boy named Reese. He was from Ohio, and he was slow in his speech. He always smiled when he spoke, and his smile was as sweet as a girl's, but sad as tears. He was sheltered under an old blanket stretched on three small sticks. I had secured an overcoat from the supplies sent us at Danville, and this I had traded to a guard for two United States blankets. I had stolen a sheet-iron tobacco plate from the cellar there which I had transformed into a dish. I had an old knife that I had managed to save from the searchers, and a haversack that had been carried through the Chattanooga campaign. I proposed a partnership with Reese, which, when I had shown my property, was speedily accomplished, and comparing our condition with that of thousands around us we were a pair of millionaires. He died in the pen at Florence. The three comrades with whom I escaped from the train died at Andersonville. One friend, with whom I slept, died at Charleston, and another was killed by a guard.

Prisoners kept pouring in until the number reached 23,000. The entire ground was covered until there was scarce room to move, and then the stockade was enlarged to thirty-three acres, and later the number of prisoners reached 35,000. The soft hillside by the tramping of so many feet became more solid,

RELEASED PRISONERS DANCING ON THE "STAR OF THE SOUTH." (FROM A WAR-TIME SKETCH BY WILLIAM WAUD.)

and thousands who had no vestige of a blanket burrowed holes to escape the heat and dew. When it rained these holes filled with water, and the occupants had to sit outside. The ration for the earlier months consisted of about four ounces of meat and a section of corn-bread four inches square by three inches thick. The bread, of unbolted meal, was baked very hard to the depth of one-half inch, while the center was raw. The bread would often be as

full of flies as a plum pudding is of fruit. As a large portion of our number drew rations after dark, the ingredients were not wasted. During the later months yams, rice, or pease were issued in lieu of meat, and meal or grits instead of bread. We had no vessels to receive these, and the steaming rice was shoveled from the wagon-box into blankets; or a man would take off his trousers, knot one of the legs, and thus receive the portion for his mess. The

same method was used in the distribution of the yams and pease, except sometimes the receptacle was a piece of underclothing.

Reese and I, with some half-dozen others, with the aid of sticks and half-canteens, dug a well something over twenty feet deep, which yielded only drops of water, but it was a great improvement over the sluggish stream which carried to us the sewage of the cook-house and the camps above. When rations were issued raw a feeble attempt was made to furnish wood. A few loads came in, so that once a week a mess of fifteen would receive two cord-wood sticks. These were so inadequate that we dug in the sand for the roots from the forest that had once covered the ground. This was done so long as a piece the size of a lead pencil remained. The heat of July and August caused Reese, and hundreds of others, to become blind after the sun went down, nor could they see until the sun rose again. We called them moon-eyed men.

All of the old prisoners had scurvy. Nine or ten months of prison life did not fail to produce it. While small-pox was epidemic in Danville the authorities caused a general vaccination. Many hundreds of these men were now attacked with a virulent gangrene. These, with the wounded, the scurvy cases, and the imbeciles, used to gather daily at the south gate to solicit medical aid. The dead were also carried there to await the opening at nine o'clock. Then Confederate doctors came in, and applied some substance to the wounds that caused them to emit smoke. This did not stop the work of the gangrene, but it killed the parasites. While the dead were accumulating I used to count thirty, forty, sixty, and more coming from all quarters of the stockade. Death came slowly. It seemed a gradual wearing out. I had noticed what I supposed was a dead soldier lying for some days near my place. He had comrades there, and at last one of us ventured to ask, "Why don't you carry that man out?" "You had better wait until he is dead." "Well, he will never be any deader than he is," was the retort. "You watch him and see." I noted him carefully for some minutes, when at last the breast heaved slightly, and emitted a faint sigh.

Passing down the hill one day a packed mass of men attracted my attention. As I pushed my way in, making inquiries, I was answered, "The hounds! The hounds!" A man sat naked on the sand. His comrades were pouring water over him. He was covered with scratches and bites from his head to his feet. His face, his breast, his back and limbs were torn and bruised. "I could have fought off the dogs," he said, "but the men cocked their revolvers and made me come down from

the tree, and then they set on the dogs until they were tired."

It was in June that a small portion of the prisoners were transformed into beasts, and began to prey upon the others. They snatched and ate the rations of the weaker ones, and they grew strong. We called them "raiders," and they grew in numbers and boldness until murder was added to theft and no one was safe. They made raids within a few steps of where I lay, and cut and bruised some men in a horrible manner. The prisoners began to organize as regulators, and armed themselves with the sticks that had supported their little shelters. The raiders, anticipating trouble, also began to organize, and called themselves regulators. The law and order men began the arrest of the raider crowd, and *they* began the arrest of the others, and even of non-combatants, that they might turn attention from themselves. The stockade was pandemonium those few days. Hundreds of half-naked men here, and hundreds there, surged to and fro, with sticks and fists for weapons. No one can say what was done. The dense crowds hid the acts of individuals, but order was victorious. A court was organized; as is well known six of the raiders were found guilty of murder and were hanged. The others, with the innocent men that had been arrested in the turmoil, were all compelled to run the gantlet, where fearful vengeance was visited upon the unfortunates.

Towards the last of August we were sent to Charleston, and later to Florence, South Carolina. There was no shelter. The weather was cold, ice forming on the little stream nightly. The rations were uncooked and more scant. There was no meat issued, and we were very weak. The punishments, as at Andersonville, involved the hounds, the buck and gag, and the chain gang. I did not see any stocks at Florence, but the commandant used to hang up by the thumbs men who had escaped and been retaken. I heard their shrieks in the long nights. Things got shadowy then. I was burning with fever and shaking to pieces. I could not eat the grits. Comrades brought me water from the swamp. I had lain so long that a depression was formed in the sand, and it was difficult to turn. I heard shots, and they said men were killed. I saw dead men carried by. Men stopped to look at me as I had looked upon others, and passed on. One said, "See how he shakes"; another, "How white that fellow is: *he* won't last long." Then there was talk of parole, and I was outside, a comrade under each shoulder. To the box-cars again — a Confederate steamer — ironclads — Fort Sumter — a transport of the United States, from the masthead of which floated the Stars and Stripes.

RELEASED—A CHEER FOR THE OLD FLAG. (FROM A SKETCH MADE ON THE UNION DESPATCH-BOAT "ELIZA HANCOCK," BY WILLIAM WAUD.)

Sailors in natty uniforms leaned over the rail, and looking down upon the deck of our rusty old cockle-shell they gave us a welcome cheer. Officers on board, and others passing to and fro in small boats over the choppy sea, waved us a salute. This was the sixth time we had left prison or stockade for exchange, and it now seemed that our guards had for once told us the truth. We had often said, during the weary months from Libby to Florence, that when we should again see the old flag we would shout until we woke the echoes for miles around. But it was a feeble cheer that went up from the wrecks of men squatting on the open deck. Here and there some of the stronger ones formed knots of five or six and broke into such a wild dance or walk around, cheering, yelling, and singing the while, that they might have been regarded as maniacs loosed from their cells. Some knelt in silent prayer, and tear-drops cut faint furrows down grimy cheeks where they had long been strangers. Others swore and cursed. They cursed everybody related to the Confederacy and the things that had contributed to the hardships of their prison experience; and as if there were not material enough to curse on that side, they crossed the lines and cursed Lincoln and Grant because of the broken cartel. I hugged to my side the little bag of grits I had accumulated. The bag was made of remnants of clothing and held about a quart. I could not eat the grits, but dared not let them go until I knew we were surely free. I had starved so long that these broken kernels of corn were very precious. I was constantly hoping to barter them for something that I could eat, or possibly for a dose of quinine or some peppers. But now a gang plank was run out from an opening in the side of the transport. It was lined on each side with sailors, who pushed us rapidly along and aboard the big vessel. In the hold before us was a great stack of blue uniforms and clean underclothing complete from cap to shoes. Kind attendants too were there to assist us, and they said, "Strip now, quick: take everything off"; and then, "Throw your rags overboard," and out they went through a port-hole just overhead. They were very filthy; for they were the remnants of what we had worn a year and a half before in the Chattanooga campaign, remnants of what we had gained in traffic with our guards, remnants of what we had taken from the bodies of our dead. They had been held together by threads raveled from the stronger parts and sewed with

needles made from splinters of Georgia pine. We thought Charleston harbor a fit burying-ground for them all. As fast as dressed we were marched in two ranks to an upper deck, where we passed a small window from which was handed a loaf of bread to each of us—a pound loaf of wheat bread. At another window each received a great piece of raw fat pork—a half-pound, and the sweetest morsel I ever tasted. At still another window each got a pint cup full of steaming United States coffee.¹ It was then, when our digestive organs had something on which to work, when we were decently clothed and were at last free from the torture of vermin, that lost manhood began to return. Each did not now look upon his fellow as something to be watched and feared. We did not watch that night lest our bread should be stolen. In fact it was reported that we would receive rations again in the morning, which was hard to believe. Some after being rationed once fell into line the second and even a third time and hoarded their bread and meat. When their actions were noted they were told to take all they wanted.

Rounding Cape Hatteras much of this bread and meat was brought to light again, and for forty-eight hours the ship presented anything but the neat and trim appearance we noticed when we first went aboard. The ship's surgeon, the officers and their wives, vied with the sailors in attentions to their passengers. Five only of our number died on the trip to Annapolis, and here, after we had been again stripped, and washed, and our hair clipped close, we were put to bed between white sheets. Women came to my cot with oysters fresh from the bay, with bread and butter, jellies and pickles, with shining glass and snow-white napkins, and when I had eaten they said, "Now you just rest and sleep, and dream of home." When I was able to read the card at the head of my cot, I found, "Phthisis pulmonalis, fever, general debility; diet, —; treatment, —." I cannot remember the diet nor the treatment, but I remember well the ministrations of these women; how they hovered round my cot, touching up my pillow, and how their cool hands rested on my hot forehead. I do not know whether they were army nurses, residents of Annapolis, or members of Christian and sanitary commissions: I never knew; but the soldiers have not forgotten their ministrations, and give to woman's loyalty and patriotism a "royal three times three."

J. T. King.

¹ We called real coffee "United States coffee" to distinguish it from burnt corn, burnt corn bread or meal,

burnt sweet potatoes, etc., which we had used as substitutes and had called "Confederate coffee."

A PERIL OF THE PLAINS.

THE FIRST EMIGRANT TRAIN TO CALIFORNIA.

BY JOHN BIDWELL (PIONEER OF '41).

IN the spring of 1839, — living at the time in the western part of Ohio, — being then in my twentieth year, I conceived a desire to see the great prairies of the West, especially those most frequently spoken of, in Illinois, Iowa, and Missouri. Emigration from the East was tending westward, and settlers had already begun to invade those rich fields.

Starting on foot to Cincinnati, ninety miles distant, I fortunately got a chance to ride most of the way on a wagon loaded with farm produce. My outfit consisted of about \$75, the clothes I wore, and a few others in a knapsack which I carried in the usual way strapped upon my shoulders, for in those days travelers did not have valises or trunks. Though traveling was considered dangerous, I had no weapon more formidable than a pocket-knife. From Cincinnati I went down the Ohio River by steamboat to the Mississippi, up the Mississippi to St. Louis, and thence to Burlington,

in what was then the Territory of Iowa. Those were bustling days on the western rivers, which were then the chief highways of travel. The scenes at the wood landings I recall as particularly lively and picturesque. Many passengers would save a little by helping to "wood the boat," *i. e.*, by carrying wood down the bank and throwing it on the boat, a special ticket being issued on that condition. It was very interesting to see the long lines of passengers coming up the gang-plank, each with two or three sticks of wood on his shoulders. An anecdote is told of an Irishman who boarded a western steamer and wanted to know the fare to St. Louis, and, being told, asked, "What do you charge for 150 pounds of freight?" Upon learning the price, a small amount, he announced that he would go as freight. "All right," said the captain; "put him down in the hold and lay some flour barrels on him to keep him down."

In 1839 Burlington had perhaps not over two hundred inhabitants, though it was the capital of Iowa Territory. After consultation with the governor, Robert Lucas of Ohio, I

concluded to go into the interior and select a tract of land on the Iowa River. In those days one was permitted to take up 160 acres, and where practicable it was usual to take part timber and part prairie. After working awhile at putting up a log house — until all the people in the neighborhood became ill with fever and ague — I concluded to move on and strike out to the south and southwest into Missouri. I traveled across country, sometimes by the sun, without road or trail. There were houses and settlements, but they were scattered; sometimes one would have to go twenty miles to find a place to stay at night. The principal game seen was the prairie hen (*Tetraonidea cupido*); the prairie wolf (*Canis latrans*) also abounded. Continuing southwest and passing through Huntsville I struck the Missouri River near Keytesville in Chariton County. Thence I continued up the north side of the river till the westernmost settlement in Missouri was reached; this was in Platte County. The Platte Purchase, as it was called, had been recently bought from the Indians, and was newly but thickly settled, on account of its proximity to navigation, its fine timber, good water, and unsurpassed fertility.

On the route I traveled I cannot recall seeing an emigrant wagon in Missouri. The western movement, which subsequently filled Missouri and other Western States and overflowed into the adjoining Territories, had then hardly begun, except as to Platte County. The contest in Congress over the Platte Purchase, which by increasing the area of Missouri gave more territory to slavery, called wide attention to that charming region. The anti-slavery sentiment even at that date ran quite high. This was, I believe, the first addition to slave territory after the Missouri Compromise. But slavery won. The rush that followed in the space of one or two years filled the most desirable part of the purchase to overflowing. The imagination could not conceive a finer country — lovely, rolling, fertile, wonderfully productive, beautifully arranged for settlement, part prairie and part timber. The land was unsurveyed. Every settler had aimed to locate a half-mile from his neighbor, and there was as yet no conflict. Peace and contentment reigned. Nearly every place seemed to have a beautiful spring of clear cold water. The hills and prairies and the level places were alike

covered with a black and fertile soil. I cannot recall seeing an acre of poor land in Platte County. Of course there was intense longing on the part of the people of Missouri to have the Indians removed, and a corresponding desire, as soon as the purchase was consummated, to get possession of the beautiful land. It was in some sense perhaps a kind of Oklahoma movement. Another feature was the abundance of wild honey-bees. Every tree that had a hollow in it seemed to be a bee-tree, and every hollow was full of rich golden honey. A singular fact which I learned from old hunters was that the honey-bee was never found more than seventy or eighty miles in advance of the white settlements on the

JOHN BIDWELL.
(FROM A DAGUERRETYPE TAKEN BY BRADY IN 1850.)

frontier. On this attractive land I set my affections, intending to make it my home.

On my arrival, my money being all spent, I was obliged to accept the first thing that offered, and began teaching school in the country about five miles from the town of Weston, which was located on the north side of the Missouri River and about four miles above Fort Leavenworth in Kansas Territory.

THE MISSOURI RIVER AT WESTON, FROM THE KANSAS SIDE.

Possibly some may suppose it did not take much education to teach a country school at that period in Missouri. The rapid settlement of that new region had brought together people of all classes and conditions, and had thrown into juxtaposition almost every phase of intelligence as well as of illiteracy. But there was no lack of self-reliance or native shrewdness in any class, and I must say that I learned to have a high esteem for the people, among whom I found warm and lifelong friends.

But even in Missouri there were drawbacks. Rattlesnakes and copperheads were abundant. One man, it was said, found a place to suit him, but on alighting from his horse heard so many snakes that he concluded to go farther. At his second attempt, finding more snakes instead of fewer, he left the country altogether. I taught school there in all about a year. My arrival was in June, 1839, and in the fall of that year the surveyors came on to lay out the country: the lines ran every way, sometimes through a man's house, sometimes through his barn, so that there was much confusion and trouble about boundaries, etc. By the favor of certain men, and by paying a small amount for a little piece of fence here and a small clearing there, I got a claim, and purposed to make it my home, and to have my father remove there from Ohio.

In the following summer, 1840, the weather was very hot, so that during the vacation I could do but little work on my place, and needing some supplies,—books, clothes, etc.,—I concluded to take a trip to St. Louis, which

SITE OF THE OLD STOCKADE, FORT LEAVENWORTH.

I did by way of the Missouri River. The distance was six hundred miles by water; the down trip occupied two days, and was one of the most delightful experiences of my life. But returning, the river being low and full of snags, and the steamboat heavily laden,—the boats were generally light going down,—we were continually getting on sand bars, and were delayed nearly a month. This trip proved to be the turning-point in my life, for while I was gone a man had jumped my land. Generally in such cases public sentiment was against the jumper, and it was decidedly so in my case. But the scoundrel held on. He was a bully—had killed a man in Callaway County—and everybody seemed afraid of him. Influential friends of mine tried to persuade him to let me have eighty acres, half of the claim. But he was stubborn, and said that all he wanted was just what the law allowed him. Unfortunately for me, he had the legal advantage. I had worked some now and then on the place, but had not actually lived on it. The law required a certain residence, and that the preëmptor should be twenty-one years of age or a man of family. I was neither, and could do nothing. Nearly all I had earned had been spent upon the land, and when that

was taken I lost about everything I had. There being no possibility of getting another claim to suit me, I resolved to go elsewhere when spring should open.

In November or December of 1840, while still teaching school in Platte County, I came across a Frenchman named Roubideaux, who said he had been to California. He had been a trader in New Mexico, and had followed the road traveled by traders from the frontier

we could ask him was answered favorably. Generally the first question which a Missourian asked about a country was whether there was any fever and ague. I remember his answer distinctly. He said there was but one man in California that had ever had a chill there, and it was a matter of so much wonderment to the people of Monterey that they went eighteen miles into the country to see him shake. Nothing could have been more satisfactory on the

LOW WATER ON THE MISSOURI.

of Missouri to Santa Fe. He had probably gone through what is now New Mexico and Arizona into California by the Gila River trail used by the Mexicans. His description of California was in the superlative degree favorable, so much so that I resolved if possible to see that wonderful land, and with others helped to get up a meeting at Weston and invited him to make a statement before it in regard to the country. At that time when a man moved out West, as soon as he was fairly settled he wanted to move again, and naturally every question imaginable was asked in regard to this wonderful country. Roubideaux described it as one of perennial spring and boundless fertility, and laid stress on the countless thousands of wild horses and cattle. He told about oranges, and hence must have been at Los Angeles, or the mission of San Gabriel, a few miles from it. Every conceivable question that

score of health. He said that the Spanish authorities were most friendly, and that the people were the most hospitable on the globe; that you could travel all over California and it would cost you nothing for horses or food. Even the Indians were friendly. His description of the country made it seem like a Paradise.

The result was that we appointed a corresponding secretary, and a committee to report a plan of organization. A pledge was drawn up in which every signer agreed to purchase a suitable outfit, and to rendezvous at Sapling Grove in what is now the State of Kansas, on the 9th of the following May, armed and equipped to cross the Rocky Mountains to California. We called ourselves the Western Emigration Society, and as soon as the pledge was drawn up every one who agreed to come signed his name to it, and it took like wildfire.

WESTERN TERRITORIES IN THE FORTIES

SHOWING THE PRINCIPAL ROUTES OF EXPLORATION

SCALE OF ENGLISH MILES

In a short time, I think within a month, we had about five hundred names; we also had correspondence on the subject with people all over Missouri, and even as far east as Illinois and Kentucky, and as far south as Arkansas. As soon as the movement was announced in the papers we had many letters of inquiry, and we expected people in considerable numbers to join us. About that time we heard of a man living in Jackson County, Missouri, who had received a letter from a person in California named Dr. Marsh, speaking favorably of the country, and a copy of this letter was published.

Our ignorance of the route was complete. We knew that California lay west, and that was the extent of our knowledge. Some of the maps consulted, supposed of course to be correct, showed a lake in the vicinity of where Salt Lake now is; it was represented as a long lake, three or four hundred miles in extent, narrow and with two outlets, both running into the Pacific Ocean, either apparently larger than the Mississippi River. An intelligent man with whom I boarded—Elam Brown, who till recently lived in California, dying when over ninety years of age—possessed a map that showed these rivers to be large, and he advised me to take tools along to make canoes, so that if we found the country so rough that we could not get along with our wagons we could descend one of those rivers to the Pacific. Even Frémont knew nothing about Salt Lake until 1843, when for the first time he explored it and mapped it correctly, his report being first printed, I think, in 1845.

This being the first movement to cross the Rocky Mountains to California, it is not surprising that it suffered reverses before we were fairly started. One of these was the publication of a letter in a New York newspaper giving a depressing view of the country for which we were all so confidently longing. It seems that in 1837 or 1838 a man by the name of Farnham, a lawyer, went from New York City into the Rocky Mountains for his health. He was an invalid, hopelessly gone with consumption it was thought, and as a last resort he went into the mountains, traveled with the trappers, lived in the open air as the trappers lived, eating only meat as they did, and in two or three years he entirely regained his health; but instead of returning east by way of St. Louis, as he had gone, he went down the Columbia River and took a vessel to Monterey and thence to San Blas, making his way through Mexico to New York. Upon his return—in February or March, 1841—he published the letter mentioned. His bad opinion of California was based wholly on his unfortunate experience in Monterey, which I will recount.

In 1840 there lived in California an old Rocky Mountaineer by the name of Isaac Graham. He was injudicious in his talk, and by boasting that the United States or Texas would some day take California, he excited the hostility and jealousy of the people. In those days Americans were held in disfavor by the native Californians on account of the war made by Americans in Texas to wrest Texas from Mexico. The number of Americans in California at this time was very small. When I went to California in 1841 all the foreigners—and all were foreigners except Indians and Mexicans—did not, I think, exceed one hundred; nor was the character of all of them the most prepossessing. Some had been trappers in the Rocky Mountains who had not seen civilization for a quarter of a century; others were men who had found their way into California, as Roubideaux had done, by way of Mexico; others still had gone down the Columbia River to Oregon and joined trapping parties in the service of the Hudson Bay Company going from Oregon to California—men who would let their beards grow down to their knees, and wear buckskin garments made and fringed like those of the Indians, and who considered it a compliment to be told "I took ye for an Injin." Another class of men from the Rocky Mountains were in the habit of making their way by the Mohave Desert south of the Sierra Nevada into California to steal horses, sometimes driving off four or five hundred at a time. The other Americans, most numerous perhaps, were sailors who had run away from vessels and remained in the country. With few exceptions this was the character of the American population when I came to California, and they were not generally a class calculated to gain much favor with the people. Farnham happened to come into the bay of Monterey when this fellow Graham and his confederates, and all others whom the Californians suspected, were under arrest in irons on board a vessel, ready for transportation to San Blas in Mexico, whither indeed they were taken, and where some of them died in irons. I am not sure that at this time the English had a consul in California; but the United States had none, and there was no one there to take the part of the Americans. Farnham, being a lawyer, doubtless knew that the proceeding was illegal. He went ashore and protested against it, but without effect, as he was only a private individual. Probably he was there on a burning hot day, and saw only the dreary sandhills to the east of the old town of Monterey. On arriving in New York he published the letter referred to, describing how Americans were oppressed by the native Californians, and how dangerous it was for Americans to go there. The merchants of Platte

"I TOOK YE FOR AN INJIN."

County had all along protested against our going, and had tried from the beginning to discourage and break up the movement, saying it was the most unheard-of, foolish, wild-goose chase that ever entered into the brain of man for five hundred people to pull up stakes, leave that beautiful country, and go away out to a region that we knew nothing of. But they made little headway until this letter of Farnham's appeared. They republished it in a paper in the town of Liberty in Clay County,—there being no paper published in Platte County,—and sent it broadcast all over the surrounding region. The result was that as the people began to think more seriously about the scheme the membership of the society began dropping off, and so it happened at last that of all the five hundred that signed the pledge I was the only one that got ready; and even I had hard work

to do so, for I had barely means to buy a wagon, a gun, and provisions. Indeed, the man who was going with me, and who was to furnish the horses, backed out, and there I was with my wagon!

During the winter, to keep the project alive, I had made two or three trips into Jackson County, Missouri, crossing the Missouri River, always dangerous in winter when ice was running, by the ferry at Westport Landing, now Kansas City. Sometimes I had to go ten miles farther down—sixty miles from Weston—to a safer ferry at Independence Landing in order to get into Jackson County, to see men who were talking of going to California, and to get information.

At the last moment before the time to start for the rendezvous at Sapling Grove—it seemed almost providential—along came a

man named George Henshaw, an invalid, from Illinois, I think. He was pretty well dressed, was riding a fine black horse, and had ten or fifteen dollars. I persuaded him to let me take his horse and trade him for a yoke of steers to pull the wagon and a sorry-looking, one-eyed mule for him to ride. We went *via* Weston to lay in some supplies. One wagon and four or five persons here joined us. On leaving Weston, where there had been so much opposition, we were six or seven in number, and nearly half the town followed us for a mile, and some for five or six miles, to bid us good-by, showing the deep interest felt in our journey. All expressed good wishes and desired to hear from us. When we reached Sapling Grove, the place of rendezvous, in May, 1841, there was but one wagon ahead of us. For the next few days one or two wagons would come each day, and among the recruits were three families from Arkansas. We organized by electing as captain of the company a man named Bartleson from Jackson County, Missouri. He was not the best man for the position, but we were given to understand that if he was not elected captain he would not go; and as he had seven or eight men with him, and we did not want the party diminished, he was chosen. Every one furnished his own supplies. The party consisted of sixty-nine, including men, women, and children. Our teams were of oxen, mules, and horses. We had no cows, as the later emigrants usually had, and the lack of milk was a great deprivation to the children. It was understood that every one should have not less than a barrel of flour with sugar and so forth to suit; but I laid in one hundred pounds of flour more than

the usual quantity, besides other things. This I did because we were told that when we got into the mountains we probably would get out of bread and have to live on meat alone, which I thought would kill me even if it did not others. My gun was an old flint-lock rifle, but a good one. Old hunters told me to have nothing to do with cap or percussion locks, that they were unreliable, and that if I got my caps or percussion wet I could not shoot, while if I lost my flint I could pick up another on the plains. I doubt whether there was one hundred dollars in money in the whole party, but all were enthusiastic and anxious to go.

In five days after my arrival we were ready to start, but no one knew where to go, not even the captain. Finally a man came up, one of the last to arrive, and announced that a company of Catholic missionaries were on their way from St. Louis to the Flathead nation of Indians with an old Rocky Mountaineer for a guide, and that if we would wait another day they would be up with us. At first we were independent, and thought we could not afford to wait for a slow missionary party. But when we found that no one knew which way to go, we sobered down and waited for them to come up; and it was well we did, for otherwise probably not one of us would ever have reached California, because of our inexperience. Afterwards when we came in contact with Indians our people were so easily excited that if we had not had with us an old mountaineer the result would certainly have been disastrous. The name of the guide was Captain Fitzpatrick; he had been at the head of trapping parties in the Rocky Mountains for many years. He and the missionary party went with

WESTPORT LANDING, KANSAS CITY. (FROM A PRINT OF THE PERIOD.)

FATHER DE SMET.

us as far as Soda Springs, now in Idaho Territory, whence they turned north to the Flathead nation. The party consisted of three Roman Catholic priests—Father De Smet, Father Pont, Father Mengarini—and ten or eleven French Canadians, and accompanying them were an old mountaineer named John Gray and a young Englishman named Romaine, and also a man named Baker. They seemed glad to have us with them, and we certainly were glad to have their company. Father De Smet had been to the Flathead nation before. He had gone out with a trapping party, and on his return had traveled with only a guide by another route, farther to the north and through hostile tribes. He was genial, of fine presence, and one of the saintliest men I have ever known, and I cannot wonder that the Indians were made to believe him divinely protected. He was a man of great kind-

ness and great affability under all circumstances; nothing seemed to disturb his temper. The Canadians had mules and Red River carts, instead of wagons and horses,—two mules to each cart, five or six of them,—and in case of steep hills they would hitch three or four of the animals to one cart, always working them tandem. Sometimes a cart would go over, breaking everything in it to pieces; and at such times Father De Smet would be just the same—beaming with good humor.

In general our route lay from near Westport, where Kansas City now is, northwesterly over the prairie, crossing several streams, till we struck the Platte River. Then we followed along the south side of the Platte to and a day's journey or so along the South Fork. Here the features of the country became more bold and interesting. Then crossing the South Fork of the Platte, and following up the north side for a day or so, we went over to the North Fork and camped at Ash Hollow; thence up the north side of that fork, passing those noted landmarks known as the Court House Rocks, Chimney Rock, Scott's Bluffs, etc., till we came to Fort Laramie, a trading post of the American Fur Company, near which was Lupton's Fort, belonging, as I understood, to some rival company. Thence after several days we came to another noted landmark called

A BIT OF ROUGH ROAD.

ON THE WAY TO THE PLATTE.

Independence Rock, on a branch of the North Platte called the Sweetwater, which we followed up to the head, soon after striking the Little Sandy, and then the Big Sandy, which empties into Green River. Next we crossed Green River to Black Fork, which we followed up till we came to Ham's Fork, at the head of which we crossed the divide between Green and Bear rivers. Then we followed Bear River down to Soda Springs. The waters of Bear Lake discharged through that river, which we

continued to follow down on the west side till we came to Salt Lake. Then we went around the north end of the lake and struck out to the west and southwest.

For a time, until we reached the Platte River, one day was much like another. We set forth every morning and camped every night, detailing men to stand guard. Captain Fitzpatrick and the missionary party would generally take the lead and we would follow. Fitzpatrick knew all about the Indian tribes, and

when there was any danger we kept in a more compact body, to protect one another. At other times we would be scattered along, sometimes for half a mile or more. We were generally together, because there was often work to be done to avoid delay. We had to make the road, frequently digging down steep banks, filling gulches, removing stones, etc. In such cases everybody would take a spade or do something to help make the road passable. When we camped at night we usually drew the wagons and carts together in a hollow square and picketed our animals inside in the corral. The wagons were common ones and of no special pattern, and some of them were

effect, to control and pacify them. Every man started his team into a run, till the oxen, like the mules and horses, were in a full gallop. Captain Fitzpatrick went ahead and directed them to follow, and as fast as they came to the bank of the river he put the wagons in the form of a hollow square and had all the animals securely picketed within. After a while the Indians came in sight. There were only forty of them, but they were well mounted on horses, and were evidently a war party, for they had no women except one, a medicine woman. They came up and camped within a hundred yards of us on the river below. Fitzpatrick told us that they would not have come

A POWWOW WITH CHEYENNES.

covered. The tongue of one would be fastened to the back of another. To lessen the danger from Indians, we usually had no fires at night and did our cooking in the daytime.

The first incident was a scare that we had from a party of Cheyenne Indians just before we reached the Platte River, about two weeks after we set out. One of our men who chanced to be out hunting, some distance from the company and behind us, suddenly appeared without mule, gun, or pistol, and lacking most of his clothes, and in great excitement reported that he had been surrounded by thousands of Indians. The company, too, became excited, and Captain Fitzpatrick tried, but with little

in that way if they were hostile. Our hunter in his excitement said that there were thousands of them, and that they had robbed him of his gun, mule, and pistol. When the Indians had put up their lodges Fitzpatrick and John Gray, the old hunter mentioned, went out to them and by signs were made to understand that the Indians did not intend to hurt the man or to take his mule or gun, but that he was so excited when he saw them that they had to disarm him to keep him from shooting them; they did not know what had become of his pistol or of his clothes, which he said they had torn off. They surrendered the mule and the gun, thus showing that they were friendly. They proved to be Cheyenne Indians.

SPLITTING THE HERD.

Ever afterwards that man went by the name of Cheyenne Dawson.

As soon as we struck the buffalo country we found a new source of interest. Before reaching the Platte we had seen an abundance of antelope and elk, prairie wolves and villages of prairie dogs, but only an occasional buffalo. We now began to kill buffaloes for food, and at the suggestion of John Gray, and following the practice of Rocky Mountain white hunters, our people began to kill them just to get the tongues and the marrow bones, leaving all the rest of the meat on the plains for the wolves to eat. But the Cheyennes, who traveled ahead of us for two or three days, set us a better example. At their camps we noticed that when they killed buffaloes they took all the meat, everything but the bones. Indians were never wasteful of the

buffalo except in winter for the sake of the robes, and then only in order to get the whisky which traders offered them in exchange. There is no better beef in the world than that of the buffalo; it is also very good jerked, *i. e.*, cut into strings and thoroughly dried. It was an easy matter to kill buffaloes after we got to where they were numerous, by keeping out of sight and to the leeward of them. I think I can truly say that I saw in that region in one day more buffaloes than I have seen of cattle in all my life. I have seen the plain black with them for several days' journey as far as the eye could reach. They seemed to be coming northward continually from the distant plains to the Platte to get water, and would plunge in and swim across by thousands — so numerous were they that they changed not only the color of the

A RECRUIT FROM CIVILIZATION.

water, but its taste, until it was unfit to drink ; but we had to use it. One night when we were encamped on the South Fork of the Platte they came in such droves that we had to sit up and fire guns and make what fires we could to keep them from running over us and trampling us into the dust. We were obliged to go out some distance from camp to turn them : Captain Fitzpatrick told us that if we did not do this the buffaloes in front could not turn aside for the pressure of those behind. We could hear them thundering all night long ; the ground fairly trembled with vast approaching bands ; and if they had not been diverted, wagons, animals, and emigrants would have been trodden under their feet. One cannot nowadays describe the rush and wildness of the thing. A strange feature was that when old oxen, tired and foot-sore, got among a buffalo herd, as they sometimes would in the night, they would soon become as wild as the wildest buffalo ; and if ever recovered it was because they could not run so fast as the buffaloes or one's horse. The ground over which the herds trampled was left rather barren, but buffalo-grass being short and curling, in traveling over it they did not cut it up as much as they would other kinds.

On the Platte River, on the afternoon of one of the hottest days we experienced on the

plains, we had a taste of a cyclone : first came a terrific shower, followed by a fall of hail to the depth of four inches, some of the stones being as large as turkeys' eggs ; and the next day a waterspout—an angry, huge, whirling cloud column, which seemed to draw its water from the Platte River—passed within a quarter of a mile behind us. We stopped and braced ourselves against our wagons to keep them from being overturned. Had it struck us it doubtless would have demolished us.

Above the junction of the forks of the Platte we continued to pass notable natural formations—first O'Fallon's Bluffs, then Court House Rocks, a group of fantastic shapes to which some of our party started to go. After they had gone what seemed fifteen or twenty miles the huge pile looked just as far off as when they started, and so they turned and came back—so deceptive are distances in the clear atmosphere of the Rocky Mountains. A noted landmark on the North Fork, which we sighted fifty miles away, was Chimney Rock. It was then nearly square, and I think it must have been fifty feet higher than now, though after we passed it a portion of it fell off. Scott's Bluffs are known to emigrants for their picturesqueness. These formations, like those first mentioned, are composed of indurated yellow clay or soft sand rock ; they are washed and broken

O'FALLON'S BLUFFS FROM NEAR THE JUNCTION OF THE FORKS OF THE PLATTE.

into all sorts of fantastic forms by the rains and storms of ages, and have the appearance of an immense city of towers and castles. They are quite difficult to explore, as I learned by experience in an effort to pursue and kill mountain sheep or bighorn. These were seen in great numbers, but we failed to kill any, as they in-

Mountains to whom they might sell it. This was a surprise to many of us, as there had been no drinking on the way. John Gray was sent ahead to see if he could find a trapping party, and he was instructed, if successful, to have them come to a certain place on Green River. He struck a trail, and overtook a party on

FORT LARAMIE IN 1849.

habit places almost inaccessible and are exceedingly wild.

As we ascended the Platte buffaloes became scarcer, and on the Sweetwater none were to be seen. Now appeared in the distance to the north of west, gleaming under its mantle of perpetual snow, that lofty range known as the Wind River Mountains. It was the first time I had seen snow in summer; some of the peaks were very precipitous, and the view was altogether most impressive. Guided by Fitzpatrick, we crossed the Rockies at or near the South Pass, where the mountains were apparently low. Some years before a man named William Subletts, an Indian fur trader, went to the Rocky Mountains with goods in wagons, and those were the only wagons that had ever been there before us; sometimes we came across the tracks, but generally they were obliterated, and thus were of no service. Approaching Green River in the Rocky Mountains, it was found that some of the wagons, including Captain Bartleson's, had alcohol on board, and that the owners wanted to find trappers in the Rocky

their way to the buffalo region to lay in provisions, *i. e.*, buffalo meat, and they returned, and came and camped on Green River very soon after our arrival, buying the greater part, if not all, of the alcohol, it first having been diluted so as to make what they called whisky — three or four gallons of water to a gallon of alcohol. Years afterwards we heard of the fate of that party: they were attacked by Indians the very first night after they left us and several of them killed, including the captain of the trapping party, whose name was Frapp. The whisky was probably the cause.

Several years ago when I was going down Weber Cañon, approaching Salt Lake, swiftly borne along on an observation car amid cliffs and over rushing streams, something said that night at the camp-fire on Green River was forcibly recalled to mind. We had in our party an illiterate fellow named Bill Overton, who in the evening at one of the camp-fires loudly declared that nothing in his life had ever surprised him. Of course that raised a dispute. "Never surprised in your life?" "No, I never was surprised." And, moreover,

he swore that nothing ever *could* surprise him. "I should not be surprised," said he, "if I were to see a steamboat come plowing over these mountains this minute." In rattling down the cañon of Weber River it occurred to me that the reality was almost equal to Bill Overton's extravaganza, and I could but wonder what he would have said had he suddenly come upon this modern scene.

As I have said, at Soda Springs — at the northernmost bend of Bear River — our party separated. It was a bright and lovely place. The abundance of soda water, including the intermittent gushing so-called Steamboat Spring; the beautiful fir and cedar covered hills; the huge piles of red or brown sinter, the result of fountains once active but then dry — all these, together with the river, lent a charm to its wild beauty and made the spot a notable one. Here the missionary party were to turn north and go into the Flathead nation. Fort Hall, about forty miles distant on Snake River, lay on their route. There was no road; but something like a trail, doubtless used by the trappers, led in that direction. From Fort Hall there was also a trail down Snake River, by which trapping parties reached the Columbia River and Fort Vancouver, the headquarters of the Hudson Bay Company.

Our party, originally sixty-nine, including women and children, had become lessened to sixty-four in number. One had accidentally shot and killed himself at the forks of the Platte. Another of our party, named Simpson, had left us at Fort Laramie. Three had turned back from Green River, intending to make their way to Fort Bridger and await an opportunity to return home. Their names were Peyton, Rodgers, and Amos E. Frye. Thirty-two of our party, becoming discouraged, decided not to venture without path or guide into the unknown and trackless region towards California, but concluded to go with the missionary party to Fort Hall and thence find their way down Snake and Columbia rivers into Oregon.¹ The rest of us — also thirty-two in number, including Benjamin Kelsey, his wife and little daughter — remained firm, refusing to be diverted from our original purpose of going direct to California. After getting all the information we could from Captain Fitzpatrick, we regretfully bade good-by to our fellow emigrants and to Father De Smet and his party.

We were now thrown entirely upon our own resources. All the country beyond was to us

a veritable *terra incognita*, and we only knew that California lay to the west. Captain Fitzpatrick was not much better informed, but he had heard that parties had penetrated the country to the southwest and west of Salt Lake to trap for beaver; and by his advice four of our men went with the parties to Fort Hall to consult Captain Grant, who was in charge there, and to gain information. Meanwhile our depleted party slowly made its way down the west side of Bear River.

Our separation at Soda Springs recalls an incident. The days were usually very hot, the nights almost freezing. The first day our little company went only about ten miles and camped on Bear River. In company with a man named James John — always called "Jimmy John" — I wandered a mile or two down the river fishing. Seeing snow on a high mountain to the west we longed to reach it, for the heat where we were was intense. So, without losing time to get our guns or coats or to give notice at the camp, we started direct for the snow, with the impression that we could go and return by sundown. But there intervened a range of lower mountains, a certain peak of which seemed almost to touch the snow. Both of us were fleet of foot and made haste, but we only gained the summit of the peak about sundown. The distance must have been twelve or fifteen miles. A valley intervened, and the snow lay on a higher mountain beyond. I proposed to camp. But Jimmy gave me a disdainful look, as much as to say, "You are afraid to go," and quickened his gait into a run down the mountain towards the snow. I called to him to stop, but he would not even look back. A firm resolve seized me — to overtake him, but not again to ask him to return. We crossed the valley in the night, saw many Indian campfires, and gained a sharp ridge leading up to the snow. This was first brushy and then rough and rocky. The brush had no paths except those made by wild animals; the rocks were sharp, and soon cut through our moccasins and made our feet bleed. But up and up we went until long after midnight, and until a cloud covered the mountain. We were above the timber line, excepting a few stunted fir trees, under one of which we crawled to wait for day, for it was too dark to see. Day soon dawned, but we were almost frozen. Our fir-tree nest had been the lair of grizzly bears that had wallowed there and shed quantities of shaggy hair. The

¹ Of the party leaving us at Soda Springs to go into Oregon I can now, after the lapse of forty-nine years, recall by their names only the following: Mr. Williams and wife; Samuel Kelsey, his wife and five children; Josiah Kelsey and wife; C. W. Flugge; Mr. Carroll; Mr. Fowler; a Methodist Episcopal preacher,

whose name I think was also Williams; "Cheyenne Dawson"; and another called "Bear Dawson." Subsequently we heard that the party safely arrived in Oregon, and some of them we saw in California. One (C. W. Flugge) was in time to join a party and come from Oregon to California the same year (1841).

THE LARAMIE RANGE.

snow was still beyond, and we had lost both sight and direction. But in an hour or two we reached it. It was nearly as hard as ice. Filling a large handkerchief, without taking time to admire the scenery we started towards the camp by a new route, for our feet were too sore to go by way of the rocky ridge by which we had come. But the new way led into trouble. There were thickets so dense as to exclude the sun, and roaring little streams in deep, dark chasms; we had to crawl through paths which looked untrodden except by grizzlies; in one place a large bear had passed evidently only a few minutes before, crossing the deep gorge, plunging through the wild, dashing water, and wetting the steep bank as he went up. We carried our drawn butcher knives in our hands, for they were our only weapons. At last we emerged into the valley. Apparently numerous Indians had left that very morning, as shown by the tracks of lodge-poles drawn on the ground. Making haste, we soon gained the hills, and at about 2 P. M. sighted our wagons, already two or three miles on the march. When our friends saw us they stopped, and all who could ran to welcome us. They had given us up for lost, supposing that we had been killed by the hostile Blackfeet, who, as Captain Fitzpatrick had warned us, sometimes roamed through that region. The company had barricaded the camp at night as best they could, and every man had spent a sleepless night on guard. Next morning they passed several hours in scouring the country. Their first questions were: "Where have you been?" "Where have you been?" I was able to answer triumphantly, "*We have been up to the snow!*" and to demonstrate the fact by showing all the

THE GRIZZLY (*URSUS HORRIBILIS*). (FROM AN ORIGINAL PAINTING BY THE LATE CHARLES NAHL.)

snow I had left, which was now reduced to a ball about the size of my fist.

In about ten days our four men returned from Fort Hall, during which time we had advanced something over one hundred miles towards Salt Lake. They brought the information that we must strike out west of Salt Lake, — as it was even then called by the trappers, — being careful not to go too far south, lest we should get into a waterless country without grass. They also said we must be careful not to go too far north, lest we should get into a broken country and steep cañons, and wander about, as trapping parties had been known to do, and become bewildered and perish.

September had come before we reached Salt Lake, which we struck at its northern extremity. Part of the time we had purposely traveled slowly to enable the men from Fort Hall the sooner to overtake us. But unavoidable delays were frequent: daily, often hourly, the road had to be made passable for our wagons by digging down steep banks, filling gulches, etc. Indian fires obscured mountains and valleys in a dense, smoky atmosphere, so that we could not see any considerable distance in order to avoid obstacles. The principal growth, on plain and hill alike, was the interminable sage-brush (*Artemisia*), and often it was difficult, for

miles at a time, to break a road through it, and sometimes a lightly laden wagon would be overturned. Its monotonous dull color and scraggy appearance gave a most dreary aspect to the landscape. But it was not wholly useless: where large enough it made excellent fuel, and it was the home and shelter of the hare — generally known as the “jack rabbit” — and of the sage-hen. Trees were almost a sure sign of water in that region. But the mirage was most deceptive, magnifying stunted sage-brush on diminutive hillocks into trees and groves. Thus misled, we traveled all day without water, and at midnight found ourselves in a plain, level as a floor, incrustated with salt, and as white as snow. Crusts of salt broken up by our wagons, and driven by the chilly night wind like ice on the surface of a frozen pond, was to me a most striking counterfeit of a winter scene. This plain became softer and softer until our poor, almost famished, animals could not pull our wagons. In fact, we were going direct to Salt Lake and did not know it. So, in search of water, we turned from a southerly to an easterly course, and went about ten miles, and soon after daylight arrived at Bear River. So near to Salt Lake were we that the water in the river was too salt for us or our animals to use, but we had to use it; it would not

quench thirst, but it did save life. The grass looked most luxuriant, and sparkled as if covered with frost. But it was salt; our hungry, jaded animals refused to eat it, and we had to lie by a whole day to rest them before we could travel.

Leaving this camp and bearing northwest we crossed our tracks on the salt plain, having thus described a triangle of several miles in dimensions. One of the most serious of our troubles was to find water where we could camp at night. So soon came another hot day, and hard travel all day and all night without water! From a westerly course we turned directly north, and, guided by antelope trails, came in a few miles to an abundance of grass and good water. The condition of our animals compelled us to rest here nearly a week. Meanwhile two of the men who had been to Fort Hall went ahead to explore. Provisions were becoming scarce, and we saw that we must avoid unnecessary delay. The two men were gone about five days. Under their lead we set forth, bearing west, then southwest, around Salt Lake, then again west. After two or three fatiguing days,—one day and a night without water,—the first notice we had of approach to any considerable mountain was the sight of crags, dimly seen through the smoke, many hundred feet above our heads. Here was plenty of good grass and water. Nearly all now said, "Let us

saddles used by the trapping party, and had learned a little about how to make them. Packing is an art, and something that only an experienced mountaineer can do well so as to save his animal and keep his pack from falling off. We were unaccustomed to it, and the difficulties we had at first were simply indescribable. It is much more difficult to fasten a pack on an ox than on a mule or a horse. The trouble began the very first day. But we started—most of us on foot, for nearly all the animals, including several of the oxen, had to carry packs. It was but a few minutes before the packs began to turn; horses became scared, mules kicked, oxen jumped and bellowed, and articles were scattered in all directions. We took more pains, fixed things, made a new start, and did better, though packs continued occasionally to fall off and delay us.

Those that had better pack-saddles and had tied their loads securely were ahead, while the others were obliged to lag behind, because they had to repack, and sometimes things would be strewn all along the route. The first night I happened to be among those that kept pretty well back, because the horses out-traveled the oxen. The foremost came to a place and stopped where there was no water or grass, and built a fire so that we could see it and come up to them. We got there about midnight, but some of our oxen that had packs on had not come up, and among

MONUMENT POINT, SALT LAKE.

leave our wagons, otherwise the snows will overtake us before we get to California." So we stopped one day and threw away everything we could not carry, made pack-saddles and packed the oxen, mules, and horses, and started.

On Green River we had seen the style of pack-

them were my two. So I had to return the next morning and find them, Cheyenne Dawson alone volunteering to go with me. One man had brought along about a quart of water, which was carefully doled out before we started, each receiving a little canister-cover full—less

WATER !

than half a gill ; but as Dawson and I had to go for the oxen, we were given a double portion. This was all the water I had until the next day. It was a burning hot day. We could not find the trail of the oxen for a long time, and Dawson refused to go any farther, saying that there were plenty of cattle in California ; but I had to do it, for the oxen were carrying our provisions and other things. Afterwards I struck the trail, and found that the oxen instead of going west had gone north, and I followed them until nearly sundown. They had got into a grassy country, which showed that they were nearing water. Seeing Indian tracks on their trail following them, I felt there was imminent danger, and at once examined my gun and pistols to see that they were primed and ready. But soon I found my oxen lying down in tall

grass by the side of the trail. Seeing no Indians, I hastened to fasten the packs and make my way to overtake the company. They had promised to stop when they came to water and wait for me. I traveled all night, and at early dawn came to where there was plenty of water and where the company had taken their dinner the day before, but they had failed to stop for me according to promise. I was much perplexed, because I had seen many fires in the night, which I took to be Indian fires, so I fastened my oxen to a scraggy willow and began to make circles around to see which way the company had gone. The ground was so hard that the animals had made no impression, which bewildered me. Finally, while making a circle of about three miles away off to the south, I saw two men coming on horseback. In the

glare of the mirage, which distorted everything, I could not tell whether they were Indians or white men, but I supposed them to be Indians, feeling sure our party would go west and not south. In a mirage a man on horseback looks as tall as a tree, and I could only tell by the motion that they were mounted. I made a beeline to my oxen, to make breastworks of them. In doing this I came to a small stream resembling running water, into which I urged my horse, whereupon he went down into a quagmire, over head and ears, out of sight. My gun also went under the mire. I got hold of something on the bank, threw out my gun, which was full of mud and water, and holding to the rope attached to my horse, by dint of hard pulling I succeeded in getting him out—a sorry sight, his ears and eyes full of mud, and his body covered with it. At last, just in time, I was able to move and get behind the oxen. My gun was in no condition to shoot. However, putting dry powder in the pan I determined to do my best in case the supposed Indians should come up; but lo! they were two of our party coming to meet me, bringing water and provisions. It was a great relief. I felt indignant that the party had not stopped for me—not the less so when I learned that Captain Bartleson had said, when they started back to find me, that they “would be in better business to go ahead and look for a road.” He had not forgotten certain comments of mine on his qualities as a student of Indian character. An instance of this I will relate.

One morning, just as we were packing up, a party of about ninety Indians, on horseback, a regular war party, were descried coming up. Some of us begged the captain to send men out to prevent them from coming to us while we were in the confusion of packing. But he said, “Boys, you must not show any sign of hostility; if you go out there with guns the Indians will think us hostile, and may get mad and hurt us.” However, five or six of us took our guns and went out, and by signs made them halt. They did not prove to be hostile, but they had carbines, and if we had been careless and had let them come near they might, and probably would, have killed us. At last we got packed up and started, and the Indians traveled along three or four hundred yards one side or the other of us or behind us all day. They appeared anxious to trade, and offered a buckskin, well dressed, worth two or three dollars, for three or four charges of powder and three or four balls. This showed that they were in want of ammunition. The carbines indicated that they had had communication with some trading-post belonging to the Hudson’s Bay Company. They had buffalo-robcs also, which showed that they were a roving

hunting party, as there were no buffaloes within three or four hundred miles. At this time I had spoken my mind pretty freely concerning Captain Bartleson’s lack of judgment, as one could scarcely help doing under the circumstances.

We now got into a country where there was no grass nor water, and then we began to catechize the men who had gone to Fort Hall. They repeated, “If you go too far south you will get into a desert country and your animals will perish; there will be no water nor grass.” We were evidently too far south. We could not go west, and the formation of the country was such that we had to turn and go north across a range of mountains. Having struck a small stream we camped upon it all night, and next day continued down its banks, crossing from side to side, most of the time following Indian paths or paths made by antelope and deer. In the afternoon we entered a cañon the walls of which were precipitous and several hundred feet high. Finally the pleasant bermy banks gave out entirely, and we could travel only in the dry bed of what in the wet season was a raging river. It became a solid mass of stones and huge boulders, and the animals became tender-footed and sore so that they could hardly stand up, and as we continued the way became worse and worse. There was no place for us to lie down and sleep, nor could our animals lie down; the water had given out, and the prospect was indeed gloomy—the cañon had been leading us directly north. All agreed that the animals were too jaded and worn to go back. Then we called the men: “What did they tell you at Fort Hall about the northern region?” They repeated, “You must not go too far north; if you do you will get into difficult cañons that lead towards the Columbia River, where you may become bewildered and wander about and perish.” This cañon was going nearly north; in fact it seemed a little east of north. We sent some men to see if they could reach the top of the mountain by scaling the precipice somewhere and get a view, and they came back about ten or eleven o’clock, saying the country looked better three or four miles farther ahead. So we were encouraged. Even the animals seemed to take courage, and we got along much better than had been thought possible, and by one o’clock that day came out on what is now known as the Humboldt River. It was not until four years later (1845) that General Frémont first saw this river and named it Humboldt.

Our course was first westward and then southward, following this river for many days, till we came to its Sink, near which we saw a solitary horse, an indication that trappers had sometime been in that vicinity. We tried to catch him but failed; he had been there long enough

to become very wild. We saw many Indians on the Humboldt, especially towards the Sink. There were many tule marshes. The tule is a rush, large, but here not very tall. It was generally completely covered with honeydew, and this in turn was wholly covered with a pediculous-looking insect which fed upon it. The Indians gathered quantities of the honey and pressed it into balls about the size of one's fist, having the appearance of wet bran. At first we greatly relished this Indian food, but

when we saw what it was made of—that the insects pressed into the mass were the main ingredient—we lost our appetites and bought no more of it.

From the time we left our wagons many had to walk, and more and more as we advanced. Going down the Humboldt at least half were on foot. Provisions had given out; except a little coarse green grass among the willows along the river the country was dry, bare, and desolate; we saw no game except antelope, and they were scarce and hard to kill; and walking was very fatiguing. Tobacco lovers would surrender their animals for anyone to ride who would furnish them with an ounce or two to chew during the day. One day one of these devotees lost his tobacco and went back for it, but failed to find it. An Indian in a friendly manner overtook us, bringing the piece of tobacco, which he had found on our trail or at our latest camp, and surrendered it. The owner, instead of being thankful, accused the Indian of having stolen it—an impossibility, as we had seen no Indians or Indian signs for some days. Perhaps the Indian did not know what it was, else he might have kept it for smoking. But I think otherwise, for, patting his breast, he said, "Shoshone, Shoshone," which was the Indian way of showing he was friendly. The Shoshones were known as always friendly to the whites, and it is not difficult to see how other and distant tribes might claim to be Shoshones as a passport to favor.

On the Humboldt we had a further division of our ranks. In going down the river we went sometimes on one side and sometimes on the other, but mostly on the north side, till we were nearing what are now known as the Humboldt Mountains. We were getting tired, and some were in favor of leaving the oxen, of which we then had only about seven or eight, and rushing on into California. They said there was plenty of beef in California. But some of us said: "No; our oxen are now our only supply of food. We are doing well,

THE HUMBOLDT PALISADES.—THE HUMBOLDT SINK.

TRUCKEE MEADOWS.

making eighteen or twenty miles a day." One morning when it was my turn at driving the oxen, the captain traveled so fast that I could not keep up, and was left far behind. When night came I had to leave the trail and go over a rocky declivity for a mile and a half into a gloomy, damp bottom, and unpack the oxen and turn them out to eat, sleeping myself without blankets. I got up the next morning, hunted the oxen out of the willow thicket, and repacked them. Not having had supper or breakfast, and having to travel nine miles before I overtook the party, perhaps I was not in the best humor. They were waiting, and for the very good reason that they could have nothing to eat till I came up with the oxen and one could be killed. I felt badly treated, and let the captain know it plainly; but, much to my surprise, he made no reply, and none of his men said a word. We killed an ox, ate our breakfast, and got ready to start about one or two o'clock in the afternoon. When nearly ready to go, the captain and one or two of his mess came to us and said: "Boys, our animals are better than yours, and we always get out of meat before any of the rest of you. Let us have the most of the meat this time, and we will pay you back the next ox we kill." We gladly let them have all they wished. But as soon as they had taken it, and were mounted ready to start, the captain in a loud voice exclaimed: "Now we have been found fault with long enough, and we are going to California. If you can keep up with us, all right; if you cannot, you may go to —"; and away they started, the captain and eight men. One of the men would not go with the captain; he said, "The captain is wrong, and I will stay with you, boys."

In a short time they were out of sight. We followed their trail for two or three days, but after they had crossed over to the south side of the Humboldt and turned south we came into a sandy waste where the wind had entirely obliterated their tracks. We were then thrown entirely upon our own resources. It was our desire to make as great speed as

possible westward, deviating only when obstacles interposed, and in such case bearing south instead of north, so as to be found in a lower latitude in the event that winter should overtake us in the mountains. But, diverted by following our fugitive captain and party across the Humboldt, we thereby missed the luxurious Truckee meadows lying but a short distance to the west, a resting-place well and favorably known to later emigrants. So, perforce, we followed down to the Sink of the Humboldt and were obliged to drink its water, which in the fall of the year becomes stagnant and of the color of lye, and not fit to drink or use unless boiled. Here we camped. Leaving the Sink of the Humboldt, we crossed a considerable stream which must have been Carson River, and came to another stream which must have been Walker River, and followed it up to where it came out of the mountains, which proved to be the Sierra Nevada. We did not know the name of the mountains. Neither had these rivers then been named; nor had they been seen by Kit Carson or Joe Walker, for whom they were named, nor were they seen until 1845 by Frémont, who named them.

We were now camped on Walker River, at the very eastern base of the Sierra Nevada, and had only two oxen left. We sent men ahead to see if it would be possible to scale the mountains, while we killed the better of the two oxen and dried the meat in preparation for the ascent. The men returned towards evening and reported that they thought it would be possible to ascend the mountains, though very difficult. We had eaten our supper, and were ready for the climb in the morning. Looking back on the plains we saw something coming, which we decided to be Indians. They traveled very slowly, and it was difficult to understand their movements. To make a long story short, it was the eight men that had left us nine days before. They had gone farther south than we and had come to a lake, probably Carson Lake, and there had found Indians who supplied them plentifully with fish and pine nuts. Fish caught in such water are not fit to

eat at any time, much less in the fall of the year. The men had all eaten heartily of fish and pine nuts, and had got something akin to cholera morbus. We were glad to see them although they had deserted us. We ran out to meet them and shook hands, and put

sible to get through down the smaller cañon. I was one of them, Jimmy John the other. Benjamin Kelsey, who had shown himself expert in finding the way, was now, without any election, still recognized as leader, as he had been during the absence of Bartleson. A party

ABANDONED.

our frying-pans on and gave them the best supper we could. Captain Bartleson, who when we started from Missouri was a portly man, was reduced to half his former girth. He said: "Boys, if ever I get back to Missouri I will never leave that country. I would gladly eat out of the troughs with my dogs." He seemed to be heartily sick of his late experience, but that did not prevent him from leaving us twice after that.

We were now in what is at present Nevada, and probably within forty miles of the present boundary of California. We ascended the mountains on the north side of Walker River to the summit, and then struck a stream running west which proved to be the extreme source of the Stanislaus River. We followed it down for several days and finally came to where a branch ran into it, each forming a cañon. The main river flowed in a precipitous gorge in places apparently a mile deep, and the gorge that came into it was but little less formidable. At night we found ourselves on the extreme point of the promontory between the two, very tired, and with neither grass nor water. We had to stay there that night. Early the next morning two men went down to see if it would be pos-

sible to get through down the smaller cañon. The understanding was, that when we went down the cañon if it was practicable to get through we were to fire a gun so that all could follow; but if not, we were not to fire, even if we saw game. When Jimmy and I got down about three-quarters of a mile I came to the conclusion that it was impossible to get through, and said to him, "Jimmy, we might as well go back; we can't go here." "Yes, we can," said he; and insisting that we could, he pulled out a pistol and fired. It was an old dragoon pistol, and reverberated like a cannon. I hurried back to tell the company not to come down, but before I reached them the captain and his party had started. I explained, and warned them that they could not get down; but they went on as far as they could go, and then were obliged to stay all day and night to rest the animals, and had to go about among the rocks and pick a little grass for them, and go down to the stream through a terrible place in the cañon to bring water up in cups and camp-kettles, and some of the men in their boots, to pour down the animals' throats in order to keep them from perishing. Finally, four of them

pulling and four of them pushing a mule, they managed to get them up one by one, and then carried all the things up again on their backs — not an easy job for exhausted men.

In some way, nobody knows how, Jimmy got through that cañon and into the Sacramento Valley. He had a horse with him — an Indian horse that was bought in the Rocky Mountains, and which could come as near climbing a tree as any horse I ever knew. Jimmy was a character. Of all men I have ever known I think he was the most fearless; he had the bravery of a bulldog. He was not seen for two months — until he was found at Sutter's, afterwards known as Sutter's Fort, now Sacramento City.

We went on, traveling west as near as we could. When we killed our last ox we shot and ate crows or anything we could kill, and one man shot a wild-cat. We could eat anything. One day in the morning I went ahead, on foot of course, to see if I could kill something, it being understood that the company would keep on as near west as possible and find a practicable road. I followed an Indian trail down into the cañon, meeting many Indians on the way up. They did not molest me, but I did not quite like their looks. I went about ten miles down the cañon, and then began to think it time to strike north to intersect the trail of the company going west. A most difficult time I had scaling the precipice. Once I threw my gun up ahead of me, being unable to hold it and climb, and then was in despair lest I could not get up where it was, but finally I did barely manage to do so, and made my way north. As the darkness came on I was obliged to look down and feel with my feet lest I should pass over the trail of the party without seeing it. Just at dark I came to an enormous fallen tree and tried to go around the top, but the place was too brushy, so I went around the butt, which seemed to me to be about twenty or twenty-five feet above my head. This I suppose to have been one of the fallen trees in the Calaveras Grove of *Sequoia gigantea* or mammoth trees, as I have since been there, and to my own satisfaction identified the lay of the land and the tree. Hence I concluded that I must have been the first white man who ever saw the *Sequoia gigantea*, of which I told Frémont when he came to California in 1844. Of course sleep was impossible, for I had neither blanket nor coat, and burned or froze alternately as I turned from one side to the other before the small fire which I had built, until morning, when I started eastward to intersect the trail, thinking the company had turned north. But I traveled until noon and found no trail; then striking south, I came to the camp which I had left the previous

morning. The party had gone, but not where they had said they would go; for they had taken the same trail I had followed, into the cañon, and had gone up the south side, which they had found so steep that many of the poor animals could not climb it and had to be left. When I arrived the Indians were there cutting the horses to pieces and carrying off the meat. My situation, alone among strange Indians killing our poor horses, was by no means comfortable. Afterward we found that these Indians were always at war with the Californians. They were known as the Horse Thief Indians, and lived chiefly on horse flesh; they had been in the habit of raiding the ranches even to the very coast, driving away horses by the hundreds into the mountains to eat. That night after dark I overtook the party in camp.

A day or two later we came to a place where there was a great quantity of horse bones, and we did not know what it meant; we thought that an army must have perished there. They were of course horses that the Indians had driven in there and slaughtered. A few nights later, fearing depredations, we concluded to stand guard — all but one man, who would not. So we let his two horses roam where they pleased. In the morning they could not be found. A few miles away we came to a village; the Indians had fled, but we found the horses killed and some of the meat roasting on a fire.

We were now on the edge of the San Joaquin Valley, but we did not even know that we were in California. We could see a range of mountains lying to the west, — the Coast Range, — but we could see no valley. The evening of the day we started down into the valley we were very tired, and when night came our party was strung along for three or four miles, and every man slept right where darkness overtook him. He would take off his saddle for a pillow and turn his horse or mule loose, if he had one. His animal would be too poor to walk away, and in the morning he would find him, usually within fifty feet. The jaded horses nearly perished with hunger and fatigue. When we overtook the foremost of the party the next morning we found they had come to a pond of water, and one of them had killed a fat coyote; when I came up it was all eaten except the lights and the windpipe, on which I made my breakfast. From that camp we saw timber to the north of us, evidently bordering a stream running west. It turned out to be the stream that we had followed down in the mountains — the Stanislaus River. As soon as we came in sight of the bottom land of the stream we saw an abundance of antelopes and sandhill cranes. We killed two of each the first evening.

Wild grapes also abounded. The next day we killed thirteen deer and antelopes, jerked the meat and got ready to go on, all except the captain's mess of seven or eight, who decided to stay there and lay in meat enough to last them into California! We were really almost down to tidewater, but did not know it. Some thought it was five hundred miles yet to California. But all thought we had to cross at least that range of mountains in sight to the west before entering the promised land, and how many more beyond no one could tell. Nearly all thought it best to press on lest the snows might overtake us in the mountains before us, as they had already nearly done on the mountains behind us (the Sierra Nevada). It was now about the first of November. Our party set forth bearing northwest, aiming for a seeming gap north of a high mountain in the chain to the west of us. That mountain we found to be Mount Diablo. At night the Indians attacked the captain's camp and stole all their animals, which were the best in the company, and the next day the men had to overtake us with just what they could carry in their hands.

The next day, judging by the timber we saw, we concluded there was a river to the west. So two men went ahead to see if they could

find a trail or a crossing. The timber seen proved to be along what is now known as the San Joaquin River. We sent two men on ahead to spy out the country. At night one of them returned, saying they had come across an Indian on horseback without a saddle who wore a cloth jacket but no other clothing. From what they could understand the Indian knew Dr. Marsh and had offered to guide them to his place. He plainly said "Marsh," and of course we supposed it was the Dr. Marsh before referred to who had written the letter to a friend in Jackson County, Missouri, and so it proved. One man went with the Indian to Marsh's ranch and the other came back to tell us what he had done, with the suggestion that we should go on and cross the river (San Joaquin) at the place to which the trail was leading. In that way we found ourselves two days later at Dr. Marsh's ranch, and there we learned that we were really in California and our journey at an end. After six months we had now arrived at the first settlement in California, November 4, 1841.

The account of our reception, and of my own experiences in California in the pastoral period before the gold discovery, I must reserve for another paper.

John Bidwell.

CALIFORNIANA.

Grizzly and Pioneer.

A GREAT many persons have told stories about grizzlies and about pioneers. But there is an aspect in which the grizzly and the pioneer may be said to represent the beginnings of a chapter of national folklore, or the first halting steps towards the development of a noble myth.

I remember that an old silver-freighter who walked all day long for many successive weeks across the Nevada desert, beside his high ore wagon, once said to me: "I had a curious notion lately. I thought that, perhaps, when the American frontiersman had been dead a hundred thousand years, the stories that would be written and believed about him would be like those of the demigods." My old silver-freighter was well educated, and knew his mythology better than I did. He had full faith, too, in the permanence of the myth-making spirit. "Some fellow, I don't know who," he said, "has got to stand right out to represent all this pioneering that hundreds of us have been doing for generations. It may be a fellow with buckskins and a Kentucky rifle, or it may be a fellow with a slouch hat and a mule-whip. We can't any of us tell yet awhile." Ten years later the railroad reached the camp; he bought a small California farm and settled down, as miners, prospectors, stage-drivers, and frontiersmen of every class are doing all the time.

I have often meditated upon the idea which the old teamster of the desert had evolved, in his crude way,

feeling, far better than he could express it, the influence of the fast-passing epoch. As I consider the subject, two things, the grizzly and the California pioneer, seem on the way to take such form as to outlast railroads and cities. In a lesser sense they already belong together in literature, but perhaps they are slowly and surely assuming places side by side, or at least in the same group, in a new myth of the American continent. In the course of time—in five centuries, or twenty centuries—it may be that two giant shadows of the past, the Argonaut and his grizzly, will loom up over the Sierras, as Hercules and his Nemean lion in the legends of the Greeks.

No man is ever able to say of those things which lie within the present reality: "This is to perish; that is to broaden and grow, striking roots into universal nature until all men bear witness to its immortality." Nevertheless, when the last grizzly has perished, when the old race of miners is as far lost in traditions as the first Cornishman who picked up stream-tin, or the first iron-smelters of the Andreaswald who fought the Saxon invaders, when the great Californian valleys and all the shining slopes of the long, parallel mountain ranges beside the Pacific are clothed with continuous gardens and orchards, and mighty and populous cities grow from the villages of to-day, there ought to be a background of sublime fable to inspire poet, artist, and sculptor.

It is the first step towards a myth that always proves the most difficult. Already, the world over, men have come to know the old cañon-keeper and forest-dweller

as "the grizzly," not the grizzly bear. He has become differentiated, and is on the way to still further separation from other bears, and other creatures of the high order that furnish noble subjects for art. Sometime, I am sure, an American Thorwaldsen will know how to hew a Sierra grizzly out of some gray cliff of Rocklin granite, and there it will remain while the world endures, supreme as the Lion of Lucerne. Some day an American Barye will create in bronze a massive grizzly, lord of the land of pines and sequoias, calm and terrible as a Numidian lion. Perhaps in the day of battle, a thousand years hence, in some wild Sierra pass, the free men of the mountains, changing the course of history, and broadening the California myth to a world myth, will make the American Grizzly for all time such a name as the Lion of England, or the ancient Winged Bull of Assyria.

The Pacific Coast, a land larger in extent, more varied in soil, climate, and resources, than that western third of Europe from Gibraltar to the Arctic Circle, has already adopted the grizzly in its common speech. Where the oriental sage said of the wise man that he walked forth "alone, like the rhinoceros," the similar comparison known to the man of the land between Arizona and Alaska has been a comparison with the grizzly. A man is said to be "as strong as a grizzly," or as dreadful when aroused, or as much of a boss, or "a regular grizzly of a fellow." It is not a light phrase; it goes deep down to the roots of the matter; it is the last word said.

By a thousand camp-fires since the first trappers met grizzlies in the Rockies men have told stories of the mighty creature, and when the last grizzly is gone from the cañons the body of literature that will continue to grow up about him may some day be like the marvelous dragon literature that has sprung from the bones of the pterodactyl. The grizzly in his best estate has not only no equal for strength and dignity in the "three Americas," but he rivals the lion and tiger. Civilization is claiming his haunts so rapidly that two or three generations will see him as extinct as the saber-toothed tiger or the great cave-bear of Europe. This early perishing may give the grizzly another advantage in his progress towards a permanent place in art and literature.

Again, the grizzly stories that frontiersmen tell have all the unconscious dignity of their subject; they rise at times to the height of an epic of the Sierras, and they possess a singular vitality. One must gather them up from explorers like Lewis and Clarke, Kit Carson and St. Vrain, from placer-miners' stories of '49, from Spanish-Californian missions and stock-ranches, and from the lonely American preëmptors' cabins in the Siskiyou. One must cast aside the mere "newspaper yarns" invented by men who never saw a grizzly. Then one discovers this fundamental fact—that the grizzly has somehow impressed himself irrevocably upon the imagination of the man of the Pacific Coast, and this in a way that the black and brown bears have never yet done to any people. In the delightful German tales Bruin is a good-natured, stupid fellow, whom one cannot but like even while smiling over his adventures. The bear in the negro folk-lore of the

South assumes much the same place. But the grizzly stands apart, so different in his very nature, and so impressive in every aspect, that another long step towards the creation of a noble and satisfactory myth appears to have been taken by the pioneers, the true myth-builders and makers of literature in their log-cabins, by their winter fires. How long a step has thus been gained we shall know better when the grizzly is gone from the Sierras. Perhaps the folk-lore of the American Indians will help the development of the myth, but it seems to me that it will be on Aryan lines.

What figure may fitly stand beside the grizzly, as the grizzly will look to men a thousand years hence, when mighty bulks of rough-hewn stone set forth his majestic strength in every American city, and we leave dragons, gryphons, and phenixes to the countries where they belong? The grizzly is American to the backbone, and his qualities are appreciated wherever he is known. His companion is to be found, if anywhere, in the first American pioneer of the Rockies and Sierras, the Gold Seeker, brave, rugged, and honest as the grizzly himself. My old silver-freighter had a glimpse of the truth. "Some fellow has got to stand up and represent the whole crowd." The fact of the growing grizzly legend helps one's imagination to seize upon the more complex fact of the growing pioneer legend, which, like the other, needs only time for its fulfilment.

The Argonaut—let us call him that because he seems to like it best—has even fewer years remaining than the grizzly. Name him as you will,—prospector, placer-miner, frontiersman of the Pacific Coast, son of four generations of pioneers; call him Californian or Arizonian, whichever you choose,—there he stands at the end of the road; and though he spreads out his grasp to Alaska and Mexico, the continent is crossed, and he is disappearing, as priest and *vaquero* disappeared before him.

Strange indeed is the law of the growth of the myth-spirit, which works continually among men, but only at long intervals to full achievement. The goddess of myths either seizes upon the first of a type to lift it to the stars, or else she waits until the last of the race of heroes goes forth, Sigurd-like, to his death, before she pours her cup of immortality on his name and line. Men hear of Volsung because of his son's son who rode the Glittering Heath. The goddess may not choose among the founders of the Atlantic colonies with their heroic histories. Perhaps she will not even take the buckskin-clad Boones and Crocketts, though over them her spirit still hangs uncertain. If it may not be trapper nor hunter, voyageur, guide, nor pioneer of the Atlantic slope, or the Mississippi Valley, what is more likely than that the imagination of the race will sometime, when the last pioneer is dead, crystallize the story of the whole westward march into some Sierran Titan leaning upon his mighty pick, as Thor upon his Mjöltnir? The hills will be empty of gold; the waters will have reclaimed the deserts; new conditions of life may have come to pass over all the lands from Maine to California. But every child will hear the stories of old-world dragons and new-world grizzlies; of old-world giants and new-world pioneers.

HOW LONDON IS GOVERNED.

BY THE AUTHOR OF "GLASGOW: A MUNICIPAL STUDY."

METROPOLITAN London, the greatest and most enlightened city this world has ever seen, has never had a legal existence, a fixed boundary line, or a municipal government.

For limited purposes the metropolis became last year an administrative county and acquired a representative council; but previous to the new local government act, which gives all the counties of England elective councils, the metropolis had no distinct organization or corporate form. London, the ancient City, had maintained its old-time bounds and its venerable charters; but its area was only one square mile and its resident population was only fifty thousand, while "Greater London" had attained a population fully a hundred times as large, spread over an area of at least five hundred square miles. Greater London lay in the three counties of Middlesex, Kent, and Surrey, with huge suburbs in Essex and encroaching outposts in Hertfordshire. It was governed in the most anomalous manner by Parliament directly as an interposing providence, by the ministers of the Crown, by the magistrates of the several counties, by special boards and commissions, and by many scores of parish vestries and other minor local authorities. The acts of Parliament that affected one feature or another of the administration in whole or in part of the metropolitan area were legion, and were scattered through the statute-books of centuries. Truly this great aggregation of people and interests had a perplexingly intricate organization. But still it was somehow governed. Its vast expanding life as one social, commercial, and industrial entity found its organs.

How London has been governed in the past, how it is governed at present, how it is meeting the various social and economic problems of modern metropolitan life—these are questions eminently worthy of consideration by all who would study municipal matters. For London is the capital not only of the British Empire, but in some sense also of the whole world. Its experiences are of universal interest and importance. In it the new forces of urban life are at work in most significant ways. It is slowly but surely evolving central municipal institutions that shall meet its peculiar needs. Its population is waking

up with a sense of unity and with an appreciation of great things to be done through united municipal action for the common welfare. It is only lately that the people of advanced industrial nations have learned to accept the fact that life in cities under artificial conditions must be the permanent lot of the great majority, and that it is the business of society to adapt the urban environment to the needs of the population. Life in the modern city should not be an evil or a misfortune for any class. There should be such sanitary arrangements and administration as to make the death rate of the great city smaller than that of the nation as a whole. There should be such educational facilities as to insure to all the young people of a city the most suitable physical, intellectual, and industrial training. The masses of people in London are rising to some faint perception of these truths, and they are beginning to clamor for social and governmental reforms. The immediate future of London is fraught with magnificent possibilities. From the extreme of chaos, disorganization, and uncontrolled freedom of individual action, it is not impossible that the great metropolis may a generation hence lead all the large cities of the world in the closeness and unity of its organization and in the range of its municipal activities. Municipal socialism has a better outlook in London than in Paris or Berlin, although as yet London has given fewer tangible evidences of this trend than has any other center of civilization. However that may be, the London questions have assumed an extraordinary importance in England, and to understand them reasonably well it is necessary to review and analyze with some care the government of London.

BRITISH MUNICIPAL REFORM.

THE ever-memorable reform act of 1832, which gave representation in Parliament a modern and rational basis, was soon followed, as a part of the reform program of the day, by a general municipal government act which abolished the ancient and exclusive privileges of the merchants and trades guilds and enlarged the municipal corporations to the inclusion of the whole body of citizens paying a certain minimum amount of rates. This act of 1835 is the most signally important piece of

legislation in all the history of modern city governments. Similar to it, and a part of the same general movement, were the act of 1833, reforming the Scotch municipalities, and that of 1840, which rendered a like service to those of Ireland. Apart from minor differences in the three acts, this legislation gave a uniform framework of municipal government to, practically all the large towns and cities of the United Kingdom. It preserved the old-time government by mayors, aldermen, and councilors, while doing away with close corporations and throwing open the municipal franchise to the new classes of electors who had received the borough parliamentary franchise in the reform of 1832, the councilors becoming the direct representatives of the burghesses or citizens. I have recently described the working of one of these reformed city governments in the pages of this magazine; and Glasgow may suffice as a type of the simply, and therefore effectively, organized municipality of Great Britain, in which the whole administrative authority centers in the town council, as an elective committee of the citizens, the mayor being the annually designated presiding officer of the council. Half a century witnessed much additional legislation, which was embodied in the great municipal government consolidation act of 1882; but the general plan of 1835 remains unchanged because experience has given it the stamp of thorough approval. It is not a little strange that none of our American States has seen fit to adopt the superior and strictly republican model of a city constitution that works so well in England, and that is so obviously suited to American conditions.

But London was excluded from the operation of this act that gave healthy and popular representation to all the other large communities of England. The situation of London was exceptional, and Lord Russell announced that its reform must be made the subject of a separate act. For more than fifty years that promised reconstruction and modernization of London government has been awaited in vain, except in so far as various special enactments are to be regarded as advance instalments of reform—the new administrative county government being a very substantial instalment.

The conditions of medieval town life seem to have been fairly well met by a local government that was in the hands of the organized mercantile and trade bodies. It was these associations of burghesses who secured the old borough charters and revived the local liberties that had languished under feudal tyranny. But when in the later days the organization of industry was revolutionized, and the towns were growing at an unprecedented rate under the new forces of modern life, the government

by the self-perpetuating gilds became totally obsolete and inadequate. The gilds had remained as close corporations with their old names and old privileges, but they included few, sometimes none, of the actual working members of the trades whose names they bore, and they had no longer any relation to the industrial life, nor were they in any sense representative of the community at large. In short, their pretenses to exclusive governmental authority had become absurd and intolerable. Elsewhere they were disbanded and their accumulated estates were applied to public objects, or else they survived merely as social or mutual-benefit clubs; but in the City of London they held their ground, and they survive to-day, their authority being only slightly diminished.

THE GILDS OF LONDON.

LET us examine briefly the survival of old-time municipal government as it exists within the narrow bounds of London proper, before passing to the discussion of the great metropolis that has overflowed the limits of the old City walls. There are nearly eighty of the so-called City companies, these being the survivors of the medieval gilds. They are commonly known as the Livery Companies, because on occasions of ceremony their members of the higher grade wear distinctive garbs that date from the reign of Edward III. The twelve principal companies, in the order of precedence, are the Mercers, Grocers, Drapers, Fishmongers, Goldsmiths, Skinners, Merchant Taylors, Haberdashers, Salters, Ironmongers, Vintners, and Clothworkers. It might seem superfluous to give the long list of minor companies; but each name contains a picture of the old London life of periods when nearly all the reputable citizens were grouped as members of these quaint callings. Alphabetically arranged, and omitting the twelve already named, the London companies are: Apothecaries, Armourers and Braziers, Bakers, Barbers, Basket Makers, Blacksmiths, Bowyers, Brewers, Broderers (Embroiderers), Butchers, Carmen, Carpenters, Clockmakers, Coach and Coach-Harness Makers, Cooks, Coopers, Cordwainers, Curriers, Cutlers, Distillers, Dyers, Fanmakers, Farriers, Fellowship Porters, Feltmakers, Fletchers, Founders, Framework Knitters, Fruiterers, Girdlers, Glass-sellers, Glaziers, Glovers, Gold and Silver Wire-drawers, Gunmakers, Horners, Innholders, Joiners, Leathersellers, Loriners, Makers of Playing Cards, Masons, Musicians, Needlemakers, Painters, Parish Clerks, Pattern Makers, Pewterers, Plasterers, Plumbers, Poulterers, Saddlers, Scriveners, Shipwrights,

Spectacle Makers, Stationers, Tallow Chandlers, Tinsplate Workers, Turners, Tylers and Bricklayers, Upholders, Watermen and Lightermen, Wax Chandlers, Weavers, Wheelwrights, Woolmen.

The companies were originally designed to regulate the callings whose names they bear, and to benefit the members and their families in various ways. They became incorporated, and at length they assumed joint control of the government of the City. Admission to them was by the four methods of purchase, patrimony, apprenticeship, and honorary vote, all of which remain in vogue, although the apprenticeship is now, of course, a mere matter of form. The gilds are societies of gentlemen. Great endowments have accumulated from the rise in value and the gradual increase of modest estates or charity trust funds that were acquired by the companies for the most part several hundred years ago.

The aggregate annual income of the London gilds is not far from \$5,000,000, most of it being derived from the rents of the house property that they own in all quarters of the metropolis. They have estates in many parts of England also, and the capitalized value of all their holdings would probably far exceed \$100,000,000. The Mercers and Drapers are the richest, with incomes of \$400,000 or \$500,000 each; while the Goldsmiths, Clothworkers, and Fishmongers are reputed to be worth \$250,000 or \$300,000 a year. A number of other companies are very wealthy, while many of the minor gilds have trifling incomes. Half of the companies have their own halls, many of which are among the notable architectural survivals of the old-time London; and most of those which are without their separate buildings transact their business at the central Guildhall. About one-fourth of the income of the companies is derived from charitable trust property, and is devoted to the support of almshouses, to educational purposes, and to general charity. A large part of the remaining sums is spent in lavish ways, not less than half a million dollars a year going for banquets and entertainments. In many of the companies the members are paid solid cash for attending ordinary meetings. Membership varies from a mere handful of men in the smallest companies to about 450 in the largest, the average being not far from 100, and the total membership of the entire number being about 7000.

THE "CITY" AND ITS GOVERNMENT.

THE resident population of the City of London proper, as has been said, was fifty thousand by the last census. The "City" is a business district, with a day population of a

million souls, nineteen-twentieths of whom reside in Greater London. The members of the gilds do not, of course, to any extent live in the City. But those who reside within a radius of twenty-five miles are entitled to have a part in the City's government. They vote, in one or another of the twenty-six City wards, for aldermen and common councilors. Each ward elects an alderman for life, and each elects a number of common councilors for a one year's term. The common council has two hundred and six members. The Lord Mayor, Aldermen, and Common Councilors form a great court or governing body that controls all the affairs of the City. Recent legislation has made it possible for resident householders to assist in electing councilors and aldermen; but the affairs of the municipal corporation remain practically in the hands of the close and self-perpetuating gilds. The Lord Mayor—whose jurisdiction, it should be understood, extends only throughout the limits of the small inner City—is chosen annually from the ranks of the aldermen. The Court of Common Hall selects two aldermen who have served as Sheriff of London, and from these two the group of aldermen designate one to fill the office of Lord Mayor. Reëlection to that office is an honor rarely bestowed. When the year is ended, the Lord Mayor turns the Mansion House over to his successor and continues to serve the City as an alderman who has "passed the Chair." Of the present aldermen about half have "passed the Chair," *i. e.*, have served their year as Lord Mayor. The Queen almost invariably bestows knighthood upon the Lord Mayor, and he emerges from his brief and always exceedingly expensive months of lavish entertaining in the Mansion House with the handle of "Sir" to his name.

The City corporation, with its headquarters in the noble old Guildhall, has, like the individual companies, large estates, chiefly in the form of house property; and it also owns the great markets of London. Its affairs are administered by committees of the council. The City proper has its own separate police system, its street and drainage authorities, its educational work, and its various functions. Its "livery-men," or gild-men, besides voting for members of Parliament in the districts where they actually live, assist in electing two members for the City of London. It is not to be disputed that the corporation of London, with its constituent gilds, has become a great privileged monopoly, held together by the powerful but selfish interest of some seven thousand influential men. It was perhaps in 1873 that Mr. Gladstone in a speech at Nottingham declared that the London gilds must be reformed and their great sums of money devoted

to public purposes. Previous to that utterance the livery-men were to a considerable extent Liberal in politics, but since then they have become almost unanimously Conservative. In 1880 a parliamentary commission was appointed to inquire into the history, status, and revenues of the London companies; and its voluminous report, published in 1884, is marvelously interesting. This commission, composed of men of the highest weight and authority, advised the reform of the gilds by law, and the application of their properties to public uses.

Recent years have witnessed on the part of the workingmen and the Liberals of Greater London a series of determined assaults upon the companies; but as yet there has been no result except a marked change in the conduct of these societies. They have begun to make a large use of their funds for the purchase of parks and open spaces in and about the great metropolis, and for the endowment of technical and general education, principally in London, but also in other parts of the British Islands. The "City and Guilds of London Institute," endowed by a number of the companies, supports great central institutions for technical education, and it subsidizes night classes in the practical trades throughout the United Kingdom. Two or three of the companies are contributing heavily to the maintenance of polytechnic institutes and "people's palaces" for the young working folk of London.

Sooner or later the gilds will be obliged to surrender their political and municipal privileges, and public opinion will compel them to account openly for their funds. Possibly their endowments may be construed by Parliament as public trusts, and devoted by law, after the analogy of the old London parochial charity endowments, to the promotion of the general welfare of the metropolitan masses. However that may be, the County Council, as the representative of the aroused and gradually centralized municipal life of the Greater London, will eventually undermine the venerable charters and privileges of the City, and will reduce the central district to the status of one of a series of subordinate parts of an inclusive municipal corporation. This survival of the unreformed medieval borough will pass away within a few years; and those who have never seen a Lord Mayor's show on the 8th of November should not postpone the sight too long.

GREATER LONDON'S BOUNDARIES.

BUT we must turn from this anomaly, this fossilized relic of medievalism, to the vast modern city in which it is embedded. What are

the bounds of Greater London? There are a hundred or more diminutive old parishes within the area of the inner, the technical London. Outside this center, parish after parish has been invaded by the steadily extending rows of brick houses and the metropolitan street system. At least a hundred thousand people are added every year to this great aggregation that we popularly call London. One may go east or north or south or west from Charing Cross and almost despair of ever reaching the rim of the metropolis. In fact, at the time of the reform acts, between fifty and sixty years ago, the city had confessedly grown beyond all knowledge and control. It covered scores of parishes, each of which was governed upon ancient rural lines by an elected Board of Vestrymen whose business it was to provide for street-making, paving, drainage, public lighting, and other concerns, and to levy the rates wherewith to pay the cost of parochial government. No two parishes were governed exactly alike. There was little or no accountability on the part of local officers. No interest was taken in the election of vestrymen. One parish knew nothing about the affairs of another. The West End parishes knew less about those of East London than they knew about Calcutta or Hong Kong. Within the continuously built area there were several hundred separate local authorities. Scores of old villages had been swallowed up by the ever-encroaching metropolis, and rural conditions had given place to those of urban life.

There was a certain unmistakable organic unity in the metropolis; yet no political organization corresponding to that unity had been effected. Numerous affairs essentially important called for united action. But the absence of central agencies left the city to grow of itself, without regulation and without intelligent plans. When the vast developments of modern industry and commerce began fairly to appear, the necessity for measures recognizing the metropolis as a whole became absolutely imperative. Fortunately Parliament could be appealed to in cases of dire emergency; and the British Parliament may indeed be said to have been the governing body of London from the moment when it began to be regarded as something more than a network of contiguous parishes covered with houses.

The earliest recognition of the unity of London was shown by the general government in its provision for the registry of vital statistics. London, according to the Registrar-General, was not merely the ancient City, but the larger populated district. The old so-called Bills of Mortality, dating from the plague of 1592, prior to which deaths were not officially recorded, were from time to time extended to

include larger areas as the outside population grew. In 1838 this wider area came to be definitely known as the Registrar-General's district. It then contained 44,816 acres, or just seventy square miles. It was afterwards extended several times, but for many years it has remained fixed at 75,334 acres, or about 118 square miles. This district is practically identical with that which was adopted as the metropolis in 1855 for the purposes of the Metropolitan Board of Works, and which was adopted again in 1870 as the sphere within which the newly formed School Board for London should operate. And it has now, by the law which became operative early in 1889, and which detaches its parts from the counties of Middlesex, Kent, and Surrey, been erected into a separate administrative county. This, then, must be taken as the present official limit of Metropolitan London. The London of the Metropolitan Parliamentary Boroughs has until very lately remained an area nearly identical with the seventy square miles of the reform period of fifty years ago; but it now includes $125\frac{1}{4}$ square miles, and is therefore larger, by a district covering seven square miles, than the new county. But the Central Criminal Court District, which is regarded as another of the London boundaries, comprises more than 268,000 acres, or 420 square miles.

Finally, the Metropolitan Police District contains 690 square miles, and includes all within a radius of fifteen miles from Charing Cross. This district is now called "Greater London" in distinction from the Metropolis, in the weekly returns of the Registrar-General. The multiplicity of boundaries is somewhat confusing. But henceforth "London" or "the Metropolis" will be commonly regarded as the county area, and "Greater London" will designate in a general way the whole urban population most of which is included in the Metropolitan Police District. The census of 1881 gave the City of London 50,652 people, found 3,834,354 within the area now known as the Metropolis or the County of London, and enumerated a total of 4,776,661 in the "Greater London" of the Metropolitan Police District. The census of 1891 will show that the County now includes decidedly more than 4,000,000 people, and that there are within the police circumscription about 5,500,000. The estimate of 6,000,000 or 6,500,000 people living within twenty miles of Charing Cross may not be regarded as extravagant. And popularly speaking these people are all Londoners. Ultimately the official bounds of the municipality will include them. This larger area is not as yet densely peopled, and it will be made to accommodate several millions more.

THE GROWTH OF LONDON.

WE are too frequently disposed to think of the rapid growth of our American cities as merely incidental to the settlement of a new country, and to regard the European cities as old and stationary. It is true that their *nuclei* are ancient, but so far as the greater part of their built-up area is concerned they are almost or quite as new as the American cities. They, like our own population centers, have grown unprecedentedly in recent decades as the result of modern transportation and industrial systems. Thus London to-day is five times as large as it was at the opening of the present century. From 900,000 at that time, the population of London grew to 1,500,000 in 1830; and by 1855 it had increased to 2,500,000. Since 1855 it has more than doubled. The present sovereign has witnessed a gain of two hundred per cent. or more since she began to reign. There are three or four dwelling-houses now for every one that was visible at the date of her coronation. In the past forty years from 2000 to 2500 miles of new streets have been formed in London. Who, studying the growth of foreign cities, can doubt the continued growth of our own? London is not an exception. All the other great towns of England have grown up as by magic within this century. And the same statement applies to those of the Continent. Paris is five times as large as it was in the year 1800; Berlin has grown much more rapidly than Paris; Vienna has expanded marvelously since 1840. This is a digression; but I shall continue it enough further to remark that an examination of the causes which have built up these European centers easily justifies the judgment that none of our twenty leading American cities has begun to approach its maximum size.

From about 1805 to 1855, an even half-century, London's population had grown from a round million to two millions and a half. The situation had become almost intolerable from lack of central management. The home department of the general government maintained a metropolitan police force and kept tolerably good order. Government commissioners of sewers also levied taxes upon the whole community and provided an imperfect sort of drainage system. Underground sewers were entirely unknown in London until 1831, and they were not numerous or extensive in 1855. Not a single large underground main had been constructed. Such as they were, the sewers and drainage ditches poured their pollution directly into the Thames at frequent intervals on both banks, and at times the river was so befouled and clogged with filth that navigation was obstructed. The era of mod-

ern trade and commerce had set in, and traffic was blocked on the streets for lack of suitable central arteries. There was not in all London at that time a good pavement, nor a broad convenient thoroughfare. The river was without an adequate supply of bridges, and without suitable embankments and retaining walls.

The parishes, of which there were seventy-eight outside the City proper and within the Registrar-General's metropolitan district, were attending in an irregular way to local concerns, while some parts of the metropolis were no-man's land and were without any pretext of local management whatever. The selfishness of the fossilized City corporation was egregious. It never at any time tried to extend its government so as to include the huge outlying population; nor would it consent to any reasonable scheme for the incorporation of the Greater London. Either proceeding would have swamped this inner sanctuary of monopoly and exclusive privilege. The outsiders were too disorganized to act together. Moreover, too many of their influential fellow-citizens were members of one or another of the city companies. And so reform dragged.

THE METROPOLIS MANAGEMENT ACT.

A GREAT beginning, however, was made in the year 1855. In lieu of the complete reform and municipalization of the overgrown city, Parliament enacted what has since been known as the Metropolis Management Act. This act contained the rudiments of a municipal constitution. It divided the area outside the City proper into thirty-eight districts, following parish lines and uniting small parishes for the purposes of the act. Twenty-three parishes were regarded as large and populous enough to stand singly, and fifty-five smaller ones were grouped into fifteen districts. To these thirty-eight districts were confirmed, under a somewhat more uniform system, the local functions that the parishes had always exercised—these including local sewerage, street making and paving, street lighting, sanitary administration, and some other minor matters to which additions have been made by subsequent enactments. The principal purpose of the act was, however, to create a central authority. This body was called the Metropolitan Board of Works. Each parish or district was governed by an elective board called in the single parishes the Vestry and in the consolidated areas entitled the District Board; and these bodies were chosen by all rate-payers who were taxed for the care of the poor on a rental value of \$200 a year. The vestries and district boards varied in size according to the population of the area, the average being about 75, and the

whole number of these local representatives being about 3000. Each district board or vestry was authorized to send a representative to the Metropolitan Board of Works, and the Corporation of the City of London was given three members. Subsequently the board was enlarged and the greater districts or parishes were accorded two or three delegates, making a central body of about sixty members in all.

These thirty-eight parishes and districts remain to-day in possession of their functions as constituted in 1855: The Metropolitan Board of Works survived until April, 1889, when it was superseded by the new County Council, which I shall take further occasion to describe. The central improvements of London for the period from 1855 to 1889, enormous as they have been in the aggregate, are the work of the metropolitan board. Its first and most imperative task was the creation of a system of main sewers. Obviously the petty parish vestries could undertake no such work. Then it became the board's duty to improve systematically the main thoroughfares. The river banks, the Thames bridges, the paramount problem of parks and open spaces, the problems of overcrowding and unsanitary houses and numerous lesser matters, came under the board's jurisdiction. Its rounded generation of active work has resulted in vast improvements. London was chaos when the board found it. To-day it has many of the appointments of a modern metropolis, and it is well advanced towards the assumption of a fully organized municipal life.

Before taking up the specific departments of the board's work, and the whole subject of London's municipal appointments and public services, it may be well to continue a little further the discussion of the governmental machinery. The metropolitan board accomplished a great work, but in its latter years its administration was honeycombed with scandals. Its indirect election removed it from the people. There was no interest in its personnel, and its members were for the most part obscure. The London public knew astonishingly little about it. It was the creature of the vestries, and these vestry local governments have not themselves been successful. The vestries and district boards are practically unaccountable. The taxpayers, at least until very recently, have almost utterly ignored the election of vestrymen. The levying of taxes has been at the most various rates in the different parts of the metropolis. There has been much incompetency and extravagance, and often much lack of wisdom in the making of such public improvements as have come within the sphere of the parishes and districts.

PROPOSED MUNICIPAL CONSTITUTIONS.

NUMEROUS attempts have been made to build further upon the foundation laid in 1855, and to secure a full-wrought municipal government for London. A select committee of Parliament reported in 1861 in favor of the direct election of the Metropolitan Board of Works by the rate-payers, with a view to transforming it into a regular municipal common council. And about once in four or five years ever since 1855 some Cabinet Minister or prominent member of the House has brought in a bill to make the board a central elective council, and to supersede the vestries by newly constituted local areas with subordinate councils. Such bills were introduced by Sir George Cornewall Lewis in 1860, by John Stuart Mill in 1867, by Charles Buxton in 1869-70, by Lord Elcho in 1875, by Mr. J. F. B. Firth in 1880, and by Sir William Harcourt as Mr. Gladstone's Home Secretary in 1884.

As the latest of these important propositions it may be worth while to examine the bill of 1884, introduced by Sir William Harcourt. It created a great central council of 240 members, merging the old City corporation into the metropolis, and treating the inner City as one of the thirty-nine administrative areas, but giving it a large representation in recognition of its historical importance and its heavy property and commercial interests. Among the other districts representation was proportioned to population and wealth. All the authority possessed by the old board of works, by all the parish and district boards, by the authorities of the City corporation, and by other local functionaries, was concentrated in the hands of the new central council. This body was expected to revise and consolidate the districts, reducing their number, and granting to each a local district council composed of the members of the central body from any given district and of other elected members. These local councils were to do simply the things delegated to them by the higher authority, and were to be subject always to the control of the central council.

This London proposition adapted the general municipal system of England to the peculiar conditions of the metropolis. The principle of the English system is that of "absolute control through a directly elected authority of all administration and of all expenditure." This principle was not in controversy; it was accepted by all parties. But there had long been a strong party, inspired by the livery-men of the gilds and now largely identified with the Conservatives, who advocated the partitioning of London into six or

twelve, or even a greater number of cities, and the giving to each one a separate municipal government of its own. The idea had some seeming justification in the fact of London's vastness and of certain traditional topographic and natural lines of division. But the real motive was the effectual dismemberment of the great London that threatened to assimilate and absorb the ancient City and to dispossess its privileged beneficiaries.

What the situation called for was not a series of distinct municipalities, but a sort of federalized municipal government. There were great common concerns which required concerted action and vigorous central administration. The defeat of measures proposed in 1880 and 1884 was accomplished by the active opposition of the gilds, which spent hundreds of thousands of dollars in lobbying and sham demonstrations, and which flooded Parliament with petitions containing thousands of fictitious names. The great bill of 1884 contained the provisions of a magnificent metropolitan constitution, and its adoption would have been of incalculable advantage to the millions of Londoners.

THE ADMINISTRATIVE COUNTY.

MEANWHILE there had been a continual demand for reform in the county governments of England. These governments had been wholly non-representative. In every county a number of gentlemen, usually belonging to the landlord class, held the Queen's commissions as magistrates or justices of the peace. And they, meeting four times a year in the so-called "quarter sessions," levied the county tax, managed the road business, granted liquor licenses, and attended to all the administrative as well as the minor judicial business of the county. The great towns had all acquired their representative municipal governments, and were for most ordinary purposes detached from the counties. It was at length proposed that elective councils on about the same plan as those of the municipalities should be given to the counties, with subordinate district councils in subdivisions of the county. This great measure was brought forward by the Ministry in 1888, and it became a law to the satisfaction of all parties. It was no part of the original intention of this measure to reform London administration; but it was found in drafting the so-called Local Government Bill that it would be wholly impracticable to include in an elective government intended for the great rural county of Kent a million or two of Londoners who had overflowed the extreme north-western corner of the county. And similar considerations were applicable to Middlesex and Surrey. It was found much more feasible

to treat all the great urban communities of England as separate counties for administrative purposes. Thus London was made a county, with the area of the old Metropolitan Board of Works. The other cities of England were already organized for administrative work; but the new "administrative county" of London had to be dealt with specifically in the bill. It is a curious fact that the Conservatives, who had so strenuously opposed the earlier plans for a great London municipal organism, were now the men who laid the solid framework for such a structure, as a mere incident in the elaboration of a measure intended to initiate local self-government in the rural parts of England. When direct and centralized self-government had been given to the towns and cities of England, London was made an exception. When, more than fifty years later, it was no longer possible to deny some measure of local self-government to the counties and townships of rural England, London was for the first time given an elective central authority. If English legislation is sometimes in defiance of logical symmetry, it sooner or later accomplishes the desired results with a practical wisdom that is rarely equaled in other countries.

The parishes and districts of 1855, which still remain the local government areas of the metropolis, and from whose vestries and boards the Metropolitan Board of Works had always been constituted as a delegate body, were not taken as the basis of apportionment for the new County Council. The parliamentary reform bill of 1885 had created fifty-seven districts besides the City within the metropolitan area, for the purpose of representation in the House of Commons; and these districts were taken as the best temporary divisions for the election of councilors. Each was accorded two members, while the City proper was allowed four; and thus provision was made for one hundred and eighteen members, to be elected every three years. The councilors were empowered to add to their body nineteen members having the rank of aldermen and holding their seats for six-year terms, but having no different authority from the ordinary members. They were further to choose annually, from their own number or otherwise, a chairman, a vice-chairman, and a deputy-chairman, thus bringing the whole body up to about one hundred and forty members of a metropolitan parliament.

The bill left much to be done in the future. Thus the City of London and its functions remain practically untouched, and the parish vestries and district boards continue to exercise their accustomed jurisdiction in minor affairs. Ultimately, of course, these powers will all be conferred upon the central County Council, in

order that it may re-delegate such authority as it deems best to a revised series of ward or district councils; or else Parliament itself will ordain a new and improved subdivision of London, and constitute minor councils with well-defined duties subject to the County Council. But as matters stand, the County Council is not without an important range of authority. It supersedes the Metropolitan Board of Works, which had grown to be an administrative body of vast undertakings. It is also assigned certain administrative duties that had formerly belonged to the county justices. It is now demanding from Parliament very extensive additions to its powers. If as yet it is but a framework, it is a substantial and enduring one, and it will in the very early future have become the most important municipal administrative body in the world. It is expected that it will secure an enlargement of the official bounds of London to include an area perhaps as extensive as that of the police jurisdiction. Its members will ultimately sit *ex officio* in reformed district councils for minor administrative purposes. It will invade the sanctuary of the inner City and destroy its "flummery" and ancient traditions so far as they carry with them peculiar immunities and privileges. It will take in hand, one after another, great public works, and will make London a fitting place for its people to live in, and a convenient place for the vast world commerce that centers there.

THE BRITISH IDEAL.

HENCEFORTH, then, *the* government of London will be that of the County Council, which will gradually absorb the authority now belonging to obscure parish authorities, and will acquire very much of the jurisdiction now and heretofore exercised directly by departments or bureaus of the imperial government. The full development of that government is only a question of time. Nobody doubts what its form and principle will be. The absolute control of municipal affairs by one central, elective body, representing the masses of the citizens, will be the permanent and final government of this chief of urban communities. Such is the British ideal of a perfect municipal government. All administrative and appointive power will be vested in the council. It will work through standing committees, each committee supervising some branch of business or administration, at the head of which will be a skilled executive officer appointed upon his merits.

It is possible that the title of Mayor, or Lord Mayor, may sometime be transferred from the present head of the ancient City corporation

to the chairman of the County Council. In England, however, a mayor has no appointive power or special executive duties, but is simply a member of the common council and its presiding officer for the time being. The American idea of setting a mayor up, outside the council, as a sort of rival principality, would appear incomprehensibly absurd in England. In our own cities we attempt the impossible feat of governing ourselves by a council and by a mayor at the same time. Sometimes we arbitrarily give the greater power to the one, sometimes we give it to the other, and not infrequently we distrust both and confer administrative powers upon special boards and commissions. What is needed is municipal self-government exercised through one central organ; and this can be accomplished by choosing an absolute dictator from time to time under the title of mayor, in accordance with the ideas of certain American reformers. But this method is highly unrepugnant, besides being incompatible with a wise continuity of policy. Why does it not occur to reformers in New York, Brooklyn, Philadelphia, Chicago, and other American cities to espouse the simple, republican, stably balanced system that pertains in all foreign countries, and *par excellence* in England, of a city government controlled throughout by a central elective council?

THE NEW COUNCIL AND ITS ELECTION.

LONDON's new government rests upon a franchise so popular that practically nobody who would care to vote is excluded. In the first place, all householders are enfranchised; and this includes every man who rents a place for his family, even if it be only a small room in the garret or the cellar of a tenement house. It also includes those who live within fifteen miles of the metropolis, but own or occupy metropolitan quarters, for any purpose, worth a certain very limited rental. Owners of freehold property in London, no matter where they live, if British subjects, are entitled to vote. Widows and unmarried women who are householders, occupiers or owners of property, are also authorized to vote for county councilors. The principal basis of the franchise is the household; and the chief disqualifications are receipt of public alms and failure to pay rates that have fallen due. Any resident of the metropolis or vicinity who is entitled to vote is eligible to election. Furthermore, any British subject who owns land in London or who is possessed of a limited amount of property, no matter where he lives, may be chosen a councilor of the county of London. The fact of residence in one district does not disqualify,

either in law or in the popular judgment, for candidacy in another district.

Thus the present council, elected in January, 1889, from fifty-seven districts besides the City, is constituted in utter disregard of the precise residence of members. The successful candidates in East or South London districts were in many instances prominent men who live in the West End or in rural suburbs. If it were the English fashion, as it is the American, to elect as representatives of a ward or district only men who live in that ward or district for the general duties of a municipal council, the ward plan would be given up in whole or in part, and councilors would be elected upon a general ticket by the whole city. For the strict ward plan can never result in a representative body of the best type. But nowhere in England is residence in a ward deemed a necessary qualification.

Great interest was shown in the election of the first council. The machinery of nomination and election was borrowed from the general municipal and parliamentary systems in vogue throughout the country. Thus, it being desired that John Burns should be a candidate for the Battersea district, it was only necessary for purposes of a valid nomination that a blank should be filled out with John Burns's name, residence, and calling, and the name of the district; that it should be signed by a "proposer," a "seconder," and eight other resident voters; and that it be filed with the county's returning officer at least six days before the date of the election. An unlimited number of such nominations may be filed. The names are announced, and opportunity is given for candidates to withdraw if they choose. Four days before the election the revised lists of candidates in all the districts are posted up conspicuously. The Australian system of secret voting has long been in vogue in England, and the government provides the ballot papers. Nobody may be voted for except those who have been duly nominated in the manner specified above.

Since two councilors are elected from each of the London districts, the nomination is equivalent to an election when only two candidates are presented. In the case of Battersea, for example, there were six nominations, and therefore six names appeared on the ballot paper. The voter marked two names, and the two candidates who received the highest number of votes were elected. The candidates averaged about five in each district, one having eight. In only one was there no contest. In Saint George, Hanover Square, Colonel Howard-Vincent and Mr. Antrobus were the only nominees, and no election was held. In subsequent elections it will doubtless happen in numerous districts that the present incumbents

will be returned without opposition, as is the custom to a great extent in municipal elections throughout Great Britain.

All the stringent regulations against the lavish and corrupt use of money that have proved so salutary in purifying English parliamentary elections have been made applicable to the election of London councilors. Under no circumstances may the election expenses of a councilor aggregate more than twenty-five pounds (\$125), except that an additional threepence is allowed for each voter in the district above the first five hundred. All expenditures must be made through authorized agents, and these must report the items to the candidate, who within a month must render a complete return of expenses incurred in his election. No payments may be made on behalf of any candidate for conveyance of voters, for bands of music or parades or other public demonstrations, for clerks or messengers except at the rate of one employed person for each thousand voters, nor for placards or printed matter except through a selected advertising agent. These laws are construed strictly, carry heavy penalties, and are scrupulously observed.

This first London council possesses as high an average of ability and distinction as the House of Commons. Sir John Lubbock and the Earl of Rosebery are two of the four members for the City, and such well-known men as Mr. Firth, Mr. Lawson, Mr. Martineau, Colonel Hughes, Colonel Howard-Vincent, Mr. Antrobus, Lord Monkswell, Sir R. Hanson, Lord Compton, and John Burns are in the list, together with many who have a high local reputation for character and ability. Two ladies were elected — Lady Sandhurst and Miss Jane Cobden. The councilors added to their number by choosing the following persons as aldermen: Lord Lingen, Lord Hobhouse, Quintin Hogg, Sir Thomas Farrer, Frederic Harrison, John Barker, Edmund Routledge, Frank Debenham, S. S. Tayler, Arthur Arnold, Hon. R. Grosevenor, S. Hope Morley, J. Eccleston Gibb, G. W. E. Russell, Earl of Meath, Evan Spicer, Mark Beaufoy, Miss Cons, and the Rev. Fleming Williams. A council containing so much distinguished material and approved political ability can but have prestige and success. The aristocracy by no means predominates in the London council, although it is so liberally represented. The noble lords who hold seats are practical, popular men, with a talent for affairs, and they sit beside several scores of plain untitled citizens of London, some of whom are of as humble origin as John Burns, the labor leader, but most of whom are men of more than commonplace abilities. It may interest New York, Boston, and Chicago readers to be assured that there

are no saloon-keepers or ward "bosses" in this London council, over which Lord Rosebery presides as chairman, while the scientist-statesman, Sir John Lubbock, serves as vice-chairman, and the distinguished London reformer, Mr. Firth, as deputy-chairman.

THE LONDON SEWERS.

THE defunct board of works handed down its unfinished undertakings to the County Council. The more than thirty years of the board's existence witnessed vast, but only partly successful, attempts to undo the mistakes of the past and to modernize the metropolis. The prime occasion for the establishment of the metropolitan board in 1855 was the need of main sewers. Upon this work of a general drainage system the board had spent \$35,000,000 from 1856 to 1888. This is apart from the cost of the network of smaller sewers that ramify the parishes, and that have been built by the vestries and parish boards.

The natural drain for the whole region is, of course, the Thames; but the time had come when a free discharge at intervals into the river was intolerable. Long before this the stream would have been filled with a putrid, plague-generating mass of sludge, to the destruction of navigation and commerce as well as of life. Main sewer tunnels, following either bank, carry the sewage to a point some fifteen miles below the city, where it meets a strong tidal movement. Filtration works have been erected there at vast expense. It has been hoped that the compressed sludge, of which there are several thousand tons per day, can all eventually be disposed of as a manure; but hitherto it has been necessary to barge much of it out to sea, large vessels having been built for that purpose. The experimental work is far from completed, and the new council will find the problem of sewage disposal both expensive and vexatious. A royal commission appointed for that purpose in 1882 reported in 1884 upon this question. All the large cities of Europe have since then been watching the experiments at London, and hoping that a solution might be found that would be applicable elsewhere.

The royal commissioners found the discharge of crude sewage objectionable at any point on the Thames estuary, on both sanitary and navigation grounds, and could not approve, as a permanent measure, the discharge into the river of the impure liquid after the process of deposition or precipitation of the solid material. The only final remedy they could advise for the further purification of this liquid was its application to land. It now remains for the County Council to add sewage farms to its

present means for the disposal of the London drainage and the protection of the Thames. Sir Robert Rawlinson in an elaborate paper on "London Sewerage and Sewage" has lately declared that the entire volume of that sewage is now worth \$8,750,000 a year for manurial purposes, and that the direct irrigation of land is the true system for the London authorities to adopt. London is now a well-sewered city; and this great sanitary reform has reduced the death rate most notably.

STREETS, PARKS, AND TRANSIT.

A STREET map of London as the city was in 1840 or 1850 would be necessary to make plain all the improvements that have been wrought, especially in the central districts lying within four or five miles of Charing Cross. As the metropolis grew, naturally the pressure of traffic upon its central thoroughfares became enormous. It was necessary, at great cost, to widen and straighten important streets, and to open new thoroughfares. Thus great improvements were made in the lines of streets that lead from Charing Cross to the Bank. It became imperative to create other arteries between the City and the West End, and the Holborn Viaduct with High Holborn and New Oxford streets was constructed. Queen Victoria street and the magnificent Thames embankments constituted still another new route created with the outlay of millions. The Northumberland Avenue, the Gray's Inn Road, the Charing Cross Road, and dozens of other now important thoroughfares, have been recently cut through solid masses of buildings, involving heavy financial operations in condemning property, clearing sites, constructing the streets, and reselling the new street frontage.

London, like all other old cities, is a vast tangled network of streets that for the most part begin nowhere and end nowhere. Upon this network it became necessary to superimpose a system of main thoroughfares as avenues of communication. This work had begun, either under the authorities of the City corporation or under special parliamentary commissions, long before the day of the metropolitan board; but this body has accomplished the major part. Including the splendid river boulevards and retaining walls known as the Albert, Victoria, and Chelsea embankments, I find that the metropolitan board had expended from 1856 to 1887 about \$75,000,000 upon these main street improvements, during which time the outlying parts of the metropolis had added to the ordinary street system about 2000 miles of new thoroughfares, lined with from 500,000 to 600,000 new houses. But the

cost of these new streets has been defrayed by the adjacent property owners and the local boards; and it is to the expense of main arterial improvements that I refer. Including what the City and special commissions have spent, not less than \$100,000,000 has gone into this work of reforming the vicious street system of London since 1850. And still the task is far from completed. New lines of communication must yet be made to relieve the glut of traffic on east and west routes north of the Thames.

Only a competent central authority like the new council can manage these gigantic municipal reforms in the suitable way. While these main improvements have been in progress, it should be said in justice to the vestries and district boards that the network of lesser streets has been wonderfully changed for the better, and that London as a whole is now a well-paved city. It devolves upon the council, as upon its predecessor the board of works, to regulate the width and formation of new streets, the lining of the buildings, the naming of streets, and the numbering of houses. Unfortunately the metropolis was already far too large when this power was given to a central authority. There are fine avenues in the newer suburbs; but throughout most of the metropolis the lesser streets must remain in a condition that to an American seems painfully chaotic. An important work was done by the metropolitan board in constructing Thames bridges, but the supply is wholly insufficient. One or two new Thames tunnels are now in progress, and \$20,000,000 ought to be expended soon for additional bridges.

Great attention has been given in recent years to the acquisition of ground for parks. Formerly the principal public gardens and open spaces of London were appurtenances of the Crown, and were under control of the "Commissioners of her Majesty's Works and Public Buildings." This remains true of Hyde Park, with St. James's and Green, of Richmond, Hampton Court, and the Kew Gardens, of Regent's Park and of Greenwich—all noble pleasure grounds that are freely at the service of the London masses. But the County Council has fallen heir to a number of parks that had been either created by the metropolitan board or transferred to it. Thus in 1887 the Victoria, Battersea, and Kennington parks had been transferred from the control of her Majesty's commissioners to the metropolitan board. And among the other well-known parks, commons, and open spaces that have come under the council's charge are Southwark, Finsbury, Blackheath, Hackney, Clapham, Hampstead Heath, Stoke Newington, Shepherd's Bush, Tooting Beck, Plumstead, Streatham, Wormwood Scrubs,

Wandsworth, Vauxhall, and Brixton. A large amount of legislation enacted within the past quarter-century has had for its object the creation and preservation of open spaces, the transformation of disused cemeteries into park spaces, and the encouragement in all possible ways of park-making in and about the metropolis. The result has been surprising in the aggregate. The City corporation has lately made good use of some of its wealth in the purchase for public parks of several extensive tracts beyond the limits of the metropolis. The guilds and certain private associations are also zealously helping to atone for past neglect, and to provide the present and future metropolis with recreation grounds and breathing-spaces. But there is daily reason for regret that the need of parks was not sooner foreseen, and that so many ancient tracts of common land have been swallowed up in the expanding wilderness of brick and mortar and narrow streets beyond recovery. Much remains to be done in the opening of park spaces in London.

The great metropolis needs improved and systematized local transit. For want of anything better, the omnibus system has grown to enormous magnitude. The street railways are only moderately successful, because not permitted in the heart of the city. There are three systems, one in South London, one in North London, and one in East London, operated by several companies, and having lines aggregating about a hundred miles in length. They are not very profitable, and contribute nothing to public revenues except ordinary taxes. The regular steam railways run innumerable suburban trains, and constitute the rapid-transit system of London. Their tracks are laid upon elevated road-beds which bridge the streets. But they enter the city with so little system that their network of tracks comes short of furnishing a really scientific scheme of metropolitan transit. An underground line, the "District" road, continued by another, the "Metropolitan," serves a very important purpose, making a circuit and connecting a number of the principal railway passenger stations. Ultimately this underground system will be extended, although it has many disadvantages. The streets of London are hardly broad enough or straight enough for the introduction of anything like a complete system of surface cable or electric lines.

WATER AND LIGHTING SUPPLIES.

THE London water supply is another problem that demands attention. The health, comfort, and permanent well-being of a large city depend upon its having an abundance of

pure water as upon almost no other consideration. London has always been served by private water companies, and there are now eight of them operating in different districts. They derive nearly all their supply from the rivers Thames and Lea, the intakes being several miles above London. Strenuous attempts are made, under the acts forbidding the pollution of rivers, to keep these sources of supply uncontaminated, but with only partial success. For the most part the companies filter their water; but the supply is none of the purest, and it is limited in quantity. Because a continuous flow is not provided, most houses are obliged to use cistern storage. Legislation intended to protect consumers and compel the companies to give adequate service has not been very successful. Absurdly enough, the companies have been allowed to collect water rates based upon the rental value of the houses supplied. Now it so happens that the assessed rental value has trebled since 1855 and doubled since 1868. It has increased twenty-five per cent. since 1880. The consequence is that the water companies have been steadily increasing their charges without improving their services. They supply actually less water per house on the average than they did ten or fifteen years ago, and they collect greatly augmented rates. The market value of their shares has gone up accordingly. The advance in assessed values of house property from year to year is worth additional unearned profits of half a million dollars to the water companies every year. From 1871 to 1883 their stock had increased one hundred per cent. in value.

Parliamentary investigating committees have from time to time reported in favor of the assumption of the water supply by a central public authority, but until now the suitable authority has not existed. Negotiations looking to a purchase for the public a few years ago resulted in agreements on the part of the companies to sell out their antiquated and insufficient plants for the modest sum of about \$170,000,000; but eminent engineers estimated that an entirely new and superior supply could be procured at a cost of \$60,000,000—this to include four gallons per inhabitant per diem of pure water for drinking purposes brought from the chalk strata, and an unlimited supply of river water for general uses. The fire department was under control of the metropolitan board, and is now subject to the County Council. Its work is hampered by the private control and the insufficiency of the water supply; and everything in the situation conspires to demand a new consolidated municipal water department. Upon the organization of the council last year,

a number of bills for the enlargement of its powers and the further improvement of London government were introduced in Parliament. One of these bills provided for the purchase of the plants and rights of the water companies by the County Council. The question has been vigorously agitated during the present year, and the County Council, encouraged by the vestries and all London, is besieging Parliament for the requisite authority. The demand cannot be long resisted. A public water supply would give the citizens a far better service at materially reduced cost, besides earning sufficient profits to pay the interest charges and gradually redeem the principal of the original investment.

Most of the large British towns and cities have assumed the gas supply as a municipal function, and have found it advantageous to do so. But London has not been properly organized for such undertakings, and the manufacture and distribution of gas remains in private hands, although it is under the surveillance of the County Council. Until a few years ago a large number of gas companies competed for the London business. These are now consolidated into three companies, which operate in different territories. Their shares sell at from 250 to 300, and they pay dividends of from 12 to 18 per cent. They, like the water companies, tear the streets up quite at their own pleasure. The general government with its postal telegraph wires, the water companies, the gas companies, the council with its main drainage system, and the parish boards with their control of local drainage and paving, all have independent right to break the street surface, and it would be superfluous to comment upon the confusion that has often resulted. Nothing could better illustrate the need of a fully empowered central authority.

Twenty years ago, or more, London began to construct capacious subways for wires, pipes, and various conduits to protect the surface of the streets. But the gas companies secured the right to use the subways or not at their option; and there are on record instances where, immediately after the completion of costly and magnificent subways under beautifully paved streets, gas companies have torn up the pavement on each side from one end of the street to the other, and laid their leaking pipes in the ground. It is not so very strange then, especially in view of the fact that nearly all of the large cities of Great Britain have assumed the water and gas supplies and are operating them with great success as municipal monopolies, that the London people are now determined to centralize and to municipalize such services in the hands of their new representative body.

Electric lighting has made relatively little progress in English cities; but a noteworthy beginning in London is now announced by the St. Pancras Vestry, which has decided to provide electric light within its own populous district both for street illumination and for private consumption. Within a few years we shall undoubtedly see the subway system extended throughout the central parts of the metropolis, and carrying water pipes, illuminating and fuel gas pipes, telegraph and telephone wires, electric light and power wires, numerous pneumatic tubes, and perhaps other and newer fangled things. And these services of supply will have been taken in hand very largely by the public authorities.

HOUSING AND SANITATION.

THE housing of the working people and of the masses of the population has forced its way to the front in London, as in all great European towns, as one of the most serious problems of the day. Unfortunately, in the period when the new forces of industry were giving modern cities so rapid a growth,—the period, we may roughly say, embraced in the first half of this century,—it was deemed a matter of little public concern how private owners constructed either factories or residence blocks. They might build tenement houses to accommodate a hundred families, with practically no open court space, with low, small, and dark apartments, and with an arrangement of rooms that offended against privacy and decency and invited epidemic diseases. An ounce of prevention would have been better than remedies that are costing millions of pounds sterling. The metropolitan board was given authority over the construction of new buildings, and by successive acts of Parliament it acquired wide functions as to the housing of the people, that have now descended to the council.

Besides regulations of a sanitary nature, and those relating to safety of construction, the authorities make rules as to the height, frontage, projections, and general street appearance of houses. An act of 1882 confers a much needed power to require a certain proportionate clear space in the rear of each house. Under a series of artisans and laborers' dwellings acts the metropolitan board acquired the power to buy up property in unhealthy areas, clear away the old houses, and sell or lease the ground for the erection of suitable tenements. Several millions have been expended in this way, the best results being due to the coöperation with the authorities of private individuals and associations. Thus the Peabody Fund houses, Miss Octavia Hill's model tenements, and the

fine blocks of several incorporated associations for building workingmen's dwellings, have provided decent homes within twenty years for several hundred thousand people.

Fortunately in the outlying parts of London the prevailing type is the small house of two or three stories, and in a majority of the metropolitan districts the average is not greater than eight or ten people to a house. There are, however, in the central quarters many terribly congested districts in which nothing will suffice but wholesale demolition by the public authorities. Gradually a million or two of Londoners must be rehoused; and the vastness of this problem seems to be transforming some very practical and conservative men into socialists. In connection with the house reform legislation, authority has been given to establish workingmen's lodging-houses in London, upon the plan of those so successful in Glasgow. But little or nothing has yet been done in this direction. The parish and district authorities have power to establish free libraries and reading-rooms, and to construct and operate public baths and wash-houses. Something has been accomplished towards these ends, and there are perhaps fifteen of the combined baths and wash-houses in London; but there should be at least a hundred and fifty. The free libraries, moreover, are so few and far between that their existence is known to a very small percentage of the population.

I am aware that there is much in the intricate management of London affairs that I have left undescribed. Thus for the purposes of the English poor law there is a Metropolitan Poor Law District, subdivided into thirty parishes or unions of parishes, each subdivision having a board of guardians elected by the rate-payers. These boards administer the poor laws and care for the hundred thousand paupers of London. They administer outside relief, and support poor-houses—"work-houses" as they are called in England—and infirmaries.

The ordinary sanitary administration is in the hands of the vestries and district boards. These bodies attend to garbage removal and street-cleansing, maintain sanitary inspection of houses, employ public analysts and food inspectors, and provide against epidemic diseases. It must be remembered that each of these parishes or consolidated districts is as populous as a fair-sized city, their average inhabitancy being more than 100,000. While their functions are similar, no two of them organize their business in exactly the same way, and there are wide differences in the efficiency of their work. The sanitary administration of the entire metropolis ought to be brought under the control and inspection of the central council,

although parceled out for practical execution to the minor councils.

As a result of public improvements and reforms in the sanitary administration, imperfect as these reforms have been, the death rate of London has been reduced from more than thirty as the average annual rate per thousand during the half-century from 1800 to 1850, down to the present average rate of about twenty. This means in a population of 5,000,000 the saving of 50,000 lives a year. It means, of course, the prevention of a vastly greater number of cases of sickness, a marked increase in the average duration of life, and an important conservation of the physical strength and wealth-producing energy of the people. The saving of 500,000 lives in every decade in the one city of London as a result of improved public arrangements is a triumph in sanitary science that may well encourage further efforts.

THE LONDON SCHOOLS.

ON the creation of a popularly elected school board for the metropolis in 1870 and its great work of education I may say in a word that it has now more than four hundred schools, with about 450,000 children enrolled as pupils. Prior to 1871 all the elementary schools of London were denominational and private, being partly supported by grants from the government. There were then about 300,000 pupils enrolled in all London; and a large proportion of the schools were utterly inefficient, and attendance was irregular. Probably not 200,000 children were receiving efficient and regular instruction. There are now at least 650,000 enrolled in schools of good character and standing approved by the government inspectors. Thus the general educational condition of London has been revolutionized within twenty years. Compulsory education is not a merely nominal provision in London, for school attendance is enforced by an army of 272 "visitors."

The school board was the first public body that the metropolitan population was permitted to elect by direct vote. It has fifty-five members, elected in eleven large districts. The entire board is renewed every three years, and the principle of minority representation prevails. Thus in the Tower Hamlets district, which elects five members, the voter might "plump" his five votes for a single candidate, or might distribute them to two, three, four, or five candidates. In that district two years ago Sir Edmund Hay Currie and Mrs. Annie Besant were regarded as candidates favoring the "progressive" as opposed to the "reactionary" policy. The radicals and anti-denominationalists con-

centrated their votes upon these two candidates and elected them, whereas if they had pushed a full ticket of five names they would have been defeated. The plan gives every considerable element an opportunity to secure representation.

Supported by various agencies, public and private, technical education is rapidly advancing in London. I have recently described in this magazine the Polytechnic Institute movement, and a long chapter might be written upon the gratifying progress of other practical education movements among the working people of London in recent years. No large American city has, at this moment, so favorable a prospect for the intellectual and industrial training of all its young people as has the English metropolis.

CERTAIN PENDING QUESTIONS.

THE metropolitan police force is not under the control of any local authority, but is directed by commissioners who are responsible to the Home Office of the general government. There is a strong demand in London for the transfer of the police authority to the County Council, and the subject has provoked much discussion. It is urged that the concentration of imperial and national interests in London is so vastly important that the higher authorities should maintain control of the police in protection of all those central concerns that pertain to the greatest capital in the world. Ultimately a compromise will probably be reached. The County Council ought certainly to have some share in the police administration of the metropolis.

A problem that is continually upon the minds of the London reformers is that of the ownership and taxation of the land upon which London stands. There is very little freehold land in or about the metropolis. Houses are built upon land acquired by leasehold title. When the leases fall in, they carry the houses with them. Everything eventually goes to the ground landlord. The ownership of ground-rents and of houses is usually separate, though sometimes united in the same individual; but it is almost never the case that the occupier is the owner of either. House occupiers have no motive to make repairs, and house owners make as few as possible, especially in the twenty years that precede the falling in of a lease. Nobody acquires the home feeling, or takes a proper interest in the affairs or improvements of the vicinity in which he lives. Taxes are collected chiefly from the occupier, and local revenues are raised almost wholly from rates imposed upon the rental value of occupied house property. Lots not

built upon, since actual rental is the basis of taxation, are exempt.

The whole system is wrong. Large parts of London are held as individual properties, such as the estates of the Dukes of Westminster and Northampton and the Portman and Bedford estates; and these properties are increasing enormously in value by the falling in of leases and the increase of rentals. There is a powerful movement, led by the Liberal party, in favor of what is known as leasehold enfranchisement. It is proposed to enact laws giving the holder of a lease the right to purchase the freehold at a fair valuation. The reform has everything to commend it. The most determined opposition to it comes, however, from the advanced socialistic element that advocates the municipalization of the ground upon which London stands, and that fears the success of a reasonable reform like leasehold enfranchisement. Eminent men serving on a parliamentary commission that investigated the leasehold question in 1884 signed a report emphatically condemning it. "The system of building on leasehold ground is a great cause," they declared, "of the many evils connected with overcrowding, unsanitary building, and excessive rents"; and they further averred that "the prevailing system of building-leases is conducive to bad building, to deterioration of property towards the close of the lease, and to a want of interest on the part of the occupier in the house he inhabits; and legislation favorable to the acquisition on equitable terms of a freehold interest on the part of the leaseholder would conduce greatly to the improvement of the dwellings of the people of this country."

It remains to give a few facts about the financial administration of London. The parishes are the areas within which assessments and collections of taxes are made. The various rates are all levied upon the rental value of occupied premises, and the County Council and school board levies are collected and paid over to those central bodies by the local officers of the parishes and districts. Taxation is much heavier in some districts than in others, because of the greater amount of pauperism, or other neighborhood causes. Bills are pending in Parliament for the equalization of taxes throughout the metropolis. The council, as successor to the metropolitan board, is the borrowing authority for London. About one hundred lesser authorities — vestries, district boards, guardians of the poor for various districts, bath and wash-house commissioners, burial boards, and the school board — owe the council more than \$40,000,000, which they have expended in public improvements. The council's own net indebtedness — inherited from the metropolitan

board—approaches \$85,000,000. Thus the outstanding obligations in the name of the central municipal authority amount to about \$125,000,000. This sum may be regarded as the debt of London. The annual rental value upon which rates are levied exceeds \$150,000,000.

Many of the public improvements of the metropolis have been paid for out of the proceeds of an ancient but thoroughly objectionable tax of thirteen-pence—about twenty-six cents—upon every ton of coal brought by land or by water within an area considerably greater than that of the metropolis. The list of public works that the proceeds of these coal dues have secured in the past two hundred and fifty years is most formidable, but taxes of this kind bear too heavily upon the poor. It is the fault of the rating system of London that wealth does not pay its fair share towards public objects.

THERE is much that is instructive and admirable in the governmental arrangements of London, and still more that is commendable in the spirit of reform and progress that is now awake and active there. But perhaps the chief lessons for us in America are lessons of warning. If London, within the lifetime of men still in their prime, had taken due pre-

cautions, what errors might have been averted! London is now creating a park system, and acquiring land that has quadrupled in value within thirty years. London is widening and straightening streets, and incurring thereby the expense of appropriating frontage that costs twice as much now as it would have cost a few years ago. The people of London have been compelled to pay hundreds of millions as a penalty for the neglect to provide an adequate public water supply. They suffer an inestimable loss in convenience and in actual money through the haphazard nature of passenger transportation facilities. An intelligent system might have been devised if the matter had received due attention thirty years ago. If London had provided suitable building regulations forty or fifty years ago, and forbidden faulty and unsanitary construction, enormous subsequent expenses of demolition would have been averted. If the ground-rent system had not been allowed to grow insidiously through the past generations the general character of London, architecturally and in other respects, would have been enormously improved. Our American cities, studying the experience of Old World centers like London, cannot exercise too great forethought in preparing for the greatness that inevitably awaits them.

Albert Shaw.

THE RETURN OF THE DEAD.

WHEN the dead return, 't is not in garments ghostly,
And shapes like those in life they wore ;
Not as vague phantoms shivering through the casements,
Like fugitives from night's dim shore :

Not with signs and omens dolorous their coming ;
No outward sense their forms may mark ;
To spirit prescience alone their spirits
Speak sweetly from the outer dark.

When the dead return, 't is as a blest conviction
That fills like light the waiting soul.
It is but this ; and like the daylight fading
It vanishes without control.

Yet who has felt this bliss no more can sorrow
Hold utterly within her sway ;
He knows that howso sharp may be his anguish
It can endure but for a day !

Arlo Bates.

TOPICS OF THE TIME.

"The Century's" Twentieth Anniversary.

THE first number of this magazine (under another name) bears the date of November, 1870. If this were not an unescapable fact it would be hard for those of us who have worked in the editing and publishing of it from the beginning to realize that twenty years have elapsed since, with how much of strain and anxiety, of enthusiasm and honest pride, the initial number was at last made up, printed, bound, and issued to the world!

It has seemed to us as perhaps more modest, as well as more feasible, not to attempt at this time a detailed review of the literary and art accomplishments of THE CENTURY, but instead to dwell upon the mechanical phase of magazine development in our day; and to this end we have asked Mr. Theodore L. De Vinne to describe the evolution which has taken place in his own printing house in connection with periodical printing. Mr. De Vinne was not the first printer of the magazine; but early in its history he took hold of it, and the progress made during the lifetime of THE CENTURY has been owing very largely to his own skill, energy, and patience in experiment. In the interesting article he has written, and which is published in this number, nothing is said of this; but it would ill become us not to make here and now such public acknowledgment. With a printer less conscientious, less open to new ideas, it would have been easy to block or delay the advance in magazine illustration which has been urged forward by the Art Department of The Century Co. and the artists and artist-engravers who have so ably worked for this magazine and for its companion ST. NICHOLAS. It is gratifying to be assured that the above statement will not be set down as a strained form of self-glorification, but that, on the contrary, it only expresses the opinion of nearly all, either at home or abroad, who have watched the development of modern illustrated periodicals.

It would be an agreeable task to speak here by name of the various members of THE CENTURY force, in all the various departments, who have worked with devotion to a single end, during a large part, or the whole, of the past twenty years. But omitting this we may, and should surely, speak of one who is no longer with us. Dr. Holland, besides being one of the founders, was editor-in-chief of the magazine during eleven years of its existence. The aims and methods and general character which he gave it are strongly impressed upon THE CENTURY; while, in sympathy with the times, it has continued, and doubtless will continue, to expand in new and important directions.

If some other writer were reviewing the twenty years of this magazine we would wish him to examine the record of these pages as to printing and wood-engraving; to note the relation of THE CENTURY to American literature, painting, sculpture, architecture, landscape gardening, science, and invention, and to the various reforms that have been made or are in progress

in religious teaching, in education in general, in charitable enterprise, in the industrial world, and in governmental administration.

If there is any one dominant sentiment which an unprejudiced reviewer would recognize as pervading these forty half-yearly volumes it is, we think, a sane and earnest Americanism. Along with and part of the American spirit has been the constant endeavor to do all that such a publication might do to increase the sentiment of union throughout our diverse sisterhood of States—the sentiment of American nationality. It has always been the aim of THE CENTURY not only to be a force in literature and art, but to take a whole-some part in the discussion of great questions; not only to promote good literature and good art, but good citizenship.

The kind of Americanism which THE CENTURY has desired to cultivate is as far as possible from the "anti-abroad" cant of the political, literary, or artistic demagogue. It is the Americanism that deems the best of the Old World none too good for the New; that would, therefore, learn eagerly every lesson in good government, or in matters social or esthetic, that may be learned from the older countries; that would abolish entirely the stupid and brutal tax on foreign art, but is not so besotted in Anglomania as to wish, as do some American congressmen, to steal bodily the entire current literature of Great Britain for the benefit of American readers.

In working on the lines above briefly mentioned THE CENTURY has had the encouragement of a following of readers remarkable as to numbers—we believe in the same field unprecedented; remarkable also for generous appreciation. Mistakes have been no doubt made, some of them the result of that very spirit of experiment and desire for improvement which must characterize every live periodical—that spirit and that desire which if once lost would soon lose to us the immense and inspiring audience which it is THE CENTURY'S privilege and responsibility to address month by month and year by year.

Forestry in America.

WHAT is the present stage of development and discussion of forestry interests and subjects in this country? We have not, as yet, any real forestry in America; and we can have, therefore, only talk and writing about it, consideration and discussion, or, at best, efforts to arrange and prepare means and conditions for practical forestry. Some of the States have forestry commissions, and all should have, each with one paid officer to devote his time to the promotion of popular intelligence regarding the care of wooded lands and of the sources of streams, tree-planting, and the relation of forests to the fertility of the soil and to the agricultural prosperity of the country. We have also several State forestry associations, voluntary, unofficial organizations of public-spirited men and women who

wish to stimulate popular attention and interest regarding forestry matters. Their work is useful, but it might be made much more effective. Meetings, addresses, and newspaper writing are indispensable in the earlier stages of any movement requiring popular intelligence and coöperation, but systematic and continuous effort soon becomes necessary, and this can be commanded only by employing and paying a competent agent or secretary. Many good things have had their origin in gratuitous missionary labor, but the time comes when the work of carrying them forward must be paid for.

Effort in behalf of forestry interests takes different directions in different parts of the country. The State of New York has nearly a million acres of mountain forest lands, not in one compact body, but in scattered tracts separated by private holdings. In this situation the property of the State cannot be adequately protected from spoliation, nor properly administered as a source of revenue. Those who have given attention to the matter in this State therefore favor disposing of outlying tracts, by sale or exchange, and the acquisition by the State of sufficient additional territory to constitute a large State park, or forest reservation, around the sources of the Hudson River and the other great water-ways of the State. This plan was presented in a message from the governor to the Senate during the last session of the legislature, and by the concurrent action of both branches of that body was committed to the present Forest Commission for thorough investigation, the finding to be reported to the legislature at its next meeting. This is one of the most important forestry enterprises ever undertaken in this country. The business and commercial prosperity of the city of New York depends in very large measure upon the permanent maintenance of forest conditions around the sources of the Hudson River, and the interests of large portions of the interior of the State are also closely connected with the destiny of the North Woods. No part of the Adirondack Mountain forest region is adapted to cultivation. It is naturally suited to the perpetual production of timber, and to this crop alone. The five or six millions of people who will soon be dwellers in the great city which is so rapidly growing up on and around Manhattan Island will need the whole Adirondack wilderness for an outlying park and forest playground for their summer rest and recreation. The movement to preserve these mountain forests, and to make the region a public possession, should have the cordial support of all civilized anglers and huntsmen, of lumbermen and owners of timber lands, and of public-spirited citizens in general. At present large portions of the region are being rapidly and irretrievably ruined.

There is a recent movement in Massachusetts to secure the incorporation of a board of trustees empowered to hold any parcels of ground which may be conveyed to them on account of historic interest or beauty of scenery, and to open them as parks or commons for public use, under suitable regulations and on condition of police protection. This beginning is of great importance. All the pleasant and convenient portions of the coast of New England will soon be crowded with buildings. There will be an almost continuous town, with few places left where men can walk and meditate by the sea without being intruders upon

private grounds. Land should be secured while it is obtainable for seashore commons, parks, and open spaces, with wise foresight of the conditions which will soon result from the increasing density of our population. Unless there is prompt action in this direction our children will probably live to see the shore lands everywhere inclosed, and in many places a fee demanded for a good view of the ocean, as we had to pay to see Niagara until the State of New York made that scene of beauty and grandeur a public possession and forever free to all.

It is desirable that all such efforts as this one just organized in Massachusetts should be made broad enough to include all the various public out-of-door interests which require the attention of the people, the care of beautiful scenery, of forests, streams, and wooded lands, historic sites, fish and game preserves, the purity of the water supply for towns, the treatment of roadsides, of parks, open spaces, and public grounds of all kinds. Such movements are apt to fail of full development and efficiency unless the coöperation of all classes of out-of-door people is secured. Plans for similar objects are under consideration in New Hampshire, and we hope they may be carried into effect in the preservation of the wonderful natural beauty of the White Mountain region. The scenery of New Hampshire is one of the most valuable pecuniary possessions of the people of the State. Good work has been done in Ohio and in other States in securing the preservation of important historic sites or of tracts of unusual natural beauty. California has been especially fortunate in this respect. One of her citizens, Col. J. B. Armstrong, has offered her a gift of six hundred acres of fine redwood forest to be set apart for the public use. Congress has passed the bill reserving for the public use the Tulare Big Trees, and there is every expectation that the bill for the establishment of the Yosemite National Park will also be passed. The endeavor to rescue the present Yosemite reservation from impending injury should attract and inspire all lovers of natural beauty and of the peace and joy which it nourishes, and should appeal especially to the pride and enlist the active coöperation of Californians. There is room and need for much more effort for similar objects. The people who are interested in forestry are acting wisely in organizing and carrying forward such movements. In many of the States of our country there is no opportunity for forestry in the proper sense of the term, but there is everywhere imperative need of popular education in the care of woodlands, trees, roadsides, and open spaces, and in appreciation of the value of change of scene and environment for all who live and work under the conditions of our modern life.

Our natural interest in forestry is connected chiefly with the problems of the management and destiny of the forests on the public domain. These forests, and the lands on which they stand, belong equally to the people of the whole country. They are as much the property of the inhabitants of New York and Virginia as of the people of the States in which the nation's forests and lands are situated. They should be at once withdrawn from sale, and the army of the United States should guard them from spoliation until a commission of competent men examines them and decides what portions of them should be kept permanently in forest for the protection of the sources of important

rivers. At present these invaluable forests are pillaged and devastated without scruple or limit by people who think it fine business to appropriate to themselves without cost the property of the nation. They have been doing this so long that they appear to claim the right to continue their ravages permanently, and are indignant at the suggestion of any interference by the owners of the property. Extensive tracts of these forests are destroyed by the pasturage of sheep owned by men who have no right whatever on the nation's land. Other great areas are desolated by fires, many of which are purposely started. Now these are the plain facts regarding mountain forests and their functions which are known to all persons of intelligence who have given any serious attention to forestry subjects. The sponge-like mass of roots, soil, leaves, and other vegetable matter which forms the forest floor acts as a natural storage reservoir, and holds back the water of rainfall and melting snow, allowing it to escape and descend but slowly to the channels of the streams, which are thus fed with comparatively equable flow all the year around. If forest conditions are destroyed, if the network of living root-fibers which holds the soil together and in place on steep slopes and around the shoulders of the hills is killed out by fire or pasturage, the soil soon begins to break and slip down from the hillsides, carrying away the sponge-like stratum which before had held vast quantities of water in store in a natural reservoir spread all over the surface of the hills. After this the water rushes down the hillsides in destructive torrents; and it soon scoops out great chasms and gullies, choking the streams and covering the fertile lands of the valleys below with inert sand and gravel.

The forests on the public domain have a special interest and value for the people of this country because they guard the sources of rivers which can be used to redeem and fertilize millions of acres of arid lands. A territory large enough for a great empire can be made marvelously productive by means of irrigation, if these forests on the nation's land are protected and preserved. If forest conditions are destroyed on these mountains, many millions of acres in the arid regions below must forever remain desert and uninhabitable. The timber of these forests can be fully utilized without impairing forest conditions, or affecting in any degree the permanent flow of the streams which have their sources in them. Artificial storage reservoirs will doubtless be found necessary for purposes of irrigation, to supplement the function of the natural reservoirs, the mountain forests, but if the forests are destroyed the reservoirs will be filled up with sand and gravel, dams will be broken and swept away, and there will soon be but little water available for use in agriculture. Besides, if the forest covering of the mountains is destroyed, the mountains themselves will soon begin to change. They depend upon the forests for their permanence. If they are deprived of their indispensable vital integument, "the everlasting hills" are torn away and dragged down by rushing torrents of water and storms of wind. The rivers perish because their sources are destroyed. As much water may fall as before, but it becomes destructive instead of vivifying. It rushes away in uncontrollable fury and is lost.

All this is known. It is not a matter of theory, probability, or opinion. It has been incontrovertibly

established by repeated observations in all the mountain countries of the Old World and in our own country. The results are uniform. No exceptions have been observed, and there is no question or doubt regarding these destructive tendencies and effects among those who have observed the facts which are everywhere palpable in this department of nature and of human experience. Those who know anything of the subject are agreed that, in general, the forest-clothing of mountains cannot be permanently removed without far-reaching evil results. But the interests which are opposed to the protection of the nation's forests, and which are nourished by their constant and enormous spoliation, are strong and determined.

A Duty of Congress to Itself.

THE defeat of the International Copyright Bill on the 2d of May has illustrated the saying that next to a victory the best thing for a good cause is a defeat. The movement for honorable treatment of literary property has shown its vitality since that vote as never before; has, in fact,

Sprung harmless up, refreshed by blows.

The indignant protest with which the unexpected rejection of this measure was greeted by the press and by the opinion of educated people in general cannot be mistaken: it clearly demonstrates that whatever stigma the House of Representatives may be willing to put upon itself, the people of the United States do not deserve to rest under the charge of being "a nation of pirates." Never was public sentiment more outraged or more ill-divined than by those Representatives who concluded that their popularity was to be enhanced by voting for what they erroneously supposed to be "cheap books." There has never been presented the slightest evidence that any considerable portion of our people oppose this reform, while the Copyright Committee has poured in upon Congress petitions for its passage from hundreds of the most distinguished Americans in all walks of life. The luster of these names should have challenged the attention of Representatives and plead for the importance of the measure. As it is, the House has put itself in a most disgraceful position — disgraceful to the country, but chiefly to itself. Happily there is yet an opportunity in the present Congress for righting the record. Should the present long session terminate without the redress of this time-honored wrong, let it be a solemn obligation upon every reader of these lines to urge upon his Representative during the recess his duty to the cause of justice, to the opinion of intelligent sentiment everywhere, and to the collective and individual reputation of members of Congress.

To Representatives who do not recognize an ethical obligation to set the official seal of criminality upon an offense which has incurred the condemnation of the civilized world, appeal may be made — indeed has unceasingly been made — in the name of the prosperity of American literature. It is humiliating to have to urge upon lawmakers so elementary a consideration as the value of a national literature — that literature is the phonograph of national life, preserving and reproducing what is most worth record; that it is a standing

army for the defense of national ideas and institutions; a necessary means of fireside travel and of intellectual interchange by which the sympathies of the different sections of the country are strengthened; and, last of all, the strongest barrier to a sordid materialism which is the greatest menace to the American system of government. Alas! to reach some legislators even these considerations seem too subtle; they are not cast in the idiom of the corridors of the Capitol. Some material equation of dollars and cents seems to be needed, such as the fact that American authors have suffered the loss of millions of money by the absence of International Copyright. To such Representatives that statement seems more tangible than, for instance, this significant paragraph from Sir Henry Maine's treatise on "Popular Government":

The power to grant patents by federal authority has, however, made the American people the first in the world for the number and ingenuity of the inventions by which it has promoted the "useful arts"; while, on the other hand, the neglect to exercise this power for the advantage of foreign writers has condemned the whole American community to a literary servitude unparalleled in the history of thought.

These words, nevertheless, are painfully true, and until writers are admitted to the equality of the law with other men we probably shall never have in America a thoroughly self-sustaining profession of letters, producing a national literature of three dimensions—with depth of thought as well as length and breadth of superficial activity. It is not merely a question of the additional money return which ultimately would accrue to a given effort, though that is doubtless desirable as a condition to thorough work: it is a question rather of the soil and atmosphere which nourish letters—of a friendlier and more appreciative attitude of the people towards their own literature, of the restoration of the decreasing regard for books, and of the enhancement of the self-respect and dignity of the writer. To quote from the admirable address of the Western Association of Writers in memorializing Congress in favor of the Copyright bill:

The classics of every nation should be read by every nation, but the bulk of the literature of each country should be its own, conveying its own traditions and national ideas, and inculcating the spirit of its own institutions.

For readers as well as for authors International Copyright means a declaration of American literary independence.

The Making of California.

WITH General Bidwell's faithful narrative in the present number *THE CENTURY* begins a systematic record of some of the chief features of the Anglo-Saxon movement to California, a part of the national life which has no parallel either in our own history or in that of any other country. We say "a part of the national life," for though the immediate scene of the search for gold and of the foundation of one of our

greatest commonwealths was a narrow strip of Pacific coast, the lines of sympathy and interest at that day reached to every quarter of the country, if not to every quarter of the globe. Nothing more characteristically American than this movement has been exhibited in our hundred years. The material conquest of California is not only important in itself, but as having set the pitch for the winning of the nearer West. The actual successes of that period have had their counterparts in other portions of the country; but the romance, humor, and tragedy of the California movement have an enduring and attractive individuality. Frequently in the long story one catches a discordant note, savage or sordid, but he is a superficial student of the time who does not see that it was not all for gold that the buoyant, brave, and hardy pioneers poured into the land of promise, by every practicable route, from the workshops, colleges, farms, and offices of the East. That they were not mere misers or speculators is proved by the way they spent their treasure, the yield of which, it has been calculated, cost in the mass, in labor and expenditure, dollar for dollar.

It is, therefore, not only the development of California which interests us, but the development of Californians—the broadening of a self-reliant type of American. "Get work," says the saw:

Get work; be sure 't is better far
Than what you work to get.

Yet the spectacle of the activity of the surging crowds in the cañons of the Sierra lacks something of ideality until one ponders upon its inner motive, as shown in the entr'actes. One has only to read the newspapers of that day, or, better, to look through the volumes of "Hutchings' California Magazine," to catch the "very pulse" of the movement to California. Those pages are a sounding-board of homesick cries; they are pervaded with loneliness, with pathetic praises of home and children in prose and verse, intensified by the uncertainties of absence. Every note in the human gamut was familiar to the pioneer, but it is this lingering on the domestic note which in the retrospect gives him particular and poetic interest.

The picture of those times is a varied and salient one, full of light and shadow, and it will be the aim of our series to do justice to each. Adventure, danger, courage, heroism, and sacrifice are familiar terms to those who know the intimate life of the period, and these are thrown still more in relief against the unknown and changing conditions of a stormy experience. The events of that time are far enough away to be contemplated by this generation with the interest of novelty; and under the guidance of the pioneers themselves, led by the honored contributor of this month's paper, we hope to make our readers agreeably familiar with the pastoral life of the Spanish Californians, with the several perilous routes to the land of gold, and with the many-colored scenes in the midst of which a star of the first magnitude was added to the national flag.

OPEN LETTERS.

Spoiling the Egyptians.

THE traveler in Egypt is very soon confronted by the fact that Egypt is not all there. He visits the greatest ruin in the world, Karnak; the famous Hall of Ancestors has been stripped of its treasure: the bas-relief representing King Thothmes III. making offerings to threescore of his predecessors is in the Louvre. Seen on the spot such a sculpture would be of extraordinary interest and value even to the most casual student of Egyptian history. One stands in the doorway of the same hall and the great obelisk of Queen Hatasou rises before him—a reminder that her chair, recently found, is now in Manchester, England. A statue of the architect of Karnak would be a rare sight when one's thoughts were full of the glories of his work; the only one known is in Munich.

On one side of the main entrance to the Temple of Luxor, in front of the great pylon built by Rameses II., stands a single beautiful obelisk of red granite; its companion is in Paris. Of the two obelisks which formerly stood near Pompey's Pillar—the only conspicuous monument now left in Alexandria—one is on the Thames Embankment in London, while the other is being slowly reduced to powder by the climate of New York.¹

At Assouan the tourist visits the granite quarries whence came most of the obelisks of Egypt. Close by was once a pillar bearing a Latin inscription, to the effect that "new quarries having been discovered near Philæ, many large pilasters and columns had been hewn from them during the reigns of Severus and Antoninus (Caracalla) and his mother Julia Domna," and that the hill was "under the guardianship of Jupiter-Ammon-Cenubis (Kneph) and Juno (Saté)," deities of Elephantine. The inscription would be interesting to one standing on that very hill, but how carelessly it is passed by in the distant museum to which it has been removed.

Tombs are empty; not only were the mummies long since taken away by pilfering Arabs, but heavy sarcophagi, many of which might have been left in place without the possibility of injury, have been borne oversea.

Bubastis has been recently excavated, and its famous temple of Pasht is now scattered over the world—in London, Paris, Manchester, Greenock, York, Boston, Canada, and elsewhere. Bubastis is within two hours of Cairo on a main line of railway (to Ismailia on the Suez Canal), and if the interesting sculptures and statues found by M. Naville could have been kept on the ground and under proper surveillance (a less serious expense than their transportation) a museum would have been formed for the delight and instruc-

tion of visitors for all time. To-day, standing upon the elevated site of the houses of the town described by Herodotus, one looks across the bed of the broad canal which once flowed around the temple, and down upon a few scattered stones from among which nearly all of any interest have been removed. Probably no one person will ever see again all that was found at Bubastis, and the interest in the place itself is gone forever. Is it worth this to the museums which now hold the scattered fragments?

To give a list of all the Egyptian antiquities which are missing from their own land would be to reproduce the catalogue of the Egyptian exhibit of every museum in the world. A large part of these are mummies, funerary ornaments, vases, etc., of which there are thousands in existence, and such may properly be carried away to give pleasure and profit to the sight-seers of distant lands; but others are specific monuments, statues of gods and goddesses, bas-reliefs from the walls of certain tombs and temples, rare tablets, and the sarcophagi of famous kings, of every one of which there is but one.

The modern spoiling of Egypt was begun by Napoleon Bonaparte, who bore away the most precious things of a conquered land to enrich his own museums. Italy, served in the same way, has been more fortunate, and has seen many of her antiquities returned. In the time of Napoleon, before the era of railways and steamships, Egypt was farther removed from the great centers of civilization than is the interior of Australia to-day. Even forty years ago the traveler who had visited the temples of Egypt was looked upon as an explorer, and his book found a ready publisher. Then there was some reason for removing to other countries these neglected antiquities. The obelisk now in the Place de la Concorde was transplanted from the Temple of Luxor in 1831, when only the tops of the pylons and columns showed themselves here and there among the hovels of an Arab village. But to-day, thanks to the good work begun by M. Maspero, under the Egyptian government, the hovels have been swept away, the columns brought to light, and, when the work is completed, the temple will be seen in all its grandeur, but forever imperfect for want of the missing obelisk.

In this day of rapidly improving travel Egypt grows more accessible every year, and the time is not far distant when the journey from New York to Cairo will be no more serious a matter than is now the trip to Paris; and the Londoner will think nothing of running down to Luxor to spend his Christmas holidays under its warm sun. A thousand persons will visit Egypt a century hence to one to-day, and, without disparaging the heroic work of many of the excavators and the

¹ The following is quoted from an article in the "New York Tribune" of July 27, on the recent attempt to preserve the obelisk now standing in Central Park: "Before making the application [of the preservative] all the loose flakes on the surface were removed. They filled more than six barrels with stone, and weighed in the aggregate more than half a ton. . . . Now it

is simply a question, Professor Newberry says, how long paraffine and other preservatives can fight off the climatic attacks. If strictly cared for, the inscriptions may be retained in good condition for a century or longer. . . . The obelisk, which is now in a healthy old age, will be obliged, like everything else, to succumb at last."

grand results of their labors, it may yet come to be a matter of regret that the era of excavation could not have been contemporaneous with the day when the world would no longer think of removing the monuments from their own land and their own associations. Antiquities seen in Egypt possess an interest for even the unscientific tourist which can never be felt in the lifeless halls of the Egyptian departments of our museums.

The paramount interest in the country of the Pharaohs is not an art interest but an historical one; and its connection with the Bible, so strongly accentuated by the recent finding of the royal mummies at Deir-el-Bahari, makes it surpass all other lands in this regard. In Palestine there are only the localities to remind one of the Bible, but Egypt is full of sculptures and inscriptions which bear upon sacred history, and now the very bodies of Bible characters are being brought to light. Are we furthering historical research by scattering the tools of study throughout the world? It may be granted that much good has been done in the past and many valuable discoveries made by allowing such a document as the Rosetta Stone to rest in the British Museum within reach of the scholars of England; and the thousands of sculptures and statues in the British Museum and in other collections have done a vast educational work and have helped to interest the world in ancient Egypt. Indeed many of the more fragile monuments would probably have been destroyed long ago had they not been removed to a safe place, and before the establishment of the Museum of Egyptian Antiquities there was no such place in Egypt. Is it not time, however, to call a halt, and to provide for the preservation to Egypt, from this day forth, of all the objects she needs to make her history complete?

The exportation of antiquities by private persons has long been forbidden by law, but responsible explorers are granted permission to excavate with the understanding that a share of the result of their work shall go to the Egyptian Museum—theoretically the Museum being allowed to take whatever it pleases. But professional courtesy makes it difficult for the Museum authorities to retain the best of everything found by other explorers when the matter is left to choice, and indeed, with English influence becoming every day more paramount in Egyptian affairs, it is impossible for them to act freely. There is also too great an opportunity for the concealment of treasures, and for the carrying away to other countries of more than is needed simply to gratify a love of acquisition.

When M. Mariette, the founder of the Egyptian Museum, was in charge of the monuments, he insisted that excavations should be made only by the government of Egypt, which then furnished the necessary money. Foreign excavators were excluded, and the removal of antiquities to other countries ceased for a time. The government now provides only enough for the actual expenses of the Museum, and if new

excavations are to be made the means must be found outside of Egypt. If those interested in such work are not willing to intrust their money to the eminent commission, consisting of three Englishmen, three Egyptians, and two Frenchmen, which would at present have it in charge (provision could be made that certain approved explorers should do the work), then would it not be well to accept, with some modifications, the system of exploration which obtains in Greece? There such work by foreigners is allowed, with the restriction that absolutely no original object shall be taken from the country. Casts, squeezes, and drawings may be made, and reports published, and sometimes an explorer is granted for a certain number of years the sole right of reproduction of the objects he has excavated, and these he is allowed to sell to museums.¹

The climate of Egypt is such that many objects which elsewhere would need a roof above them can there remain uncovered in the very spot where they are found. Such of the more fragile objects as need to be removed from the place of finding should be gathered into one great treasure-house, amid the climatic conditions which have already preserved them through so many centuries.

Some of the things still hidden may well be left for our successors, but we in our passing day are trustees of the monuments now known, and there is much to be done in the way of preserving, guarding, and further excavating these. Esneh, one of the most beautiful of the Ptolemaic temples, the traveler finds nearly covered with mud-huts, and with only a single great hall visible; but here the columns are so grand and the proportions so magnificent that he longs to organize a force on the spot, dig out the other halls and the sanctuary, and reveal the beauties which are only awaiting an explorer with the means.

Thirty years ago the Temple of Edfou, now the most perfect of all, was buried under forty feet of soil, and nothing was visible except the top of the pylons. M. Mariette says: "I caused to be demolished the sixty-four houses which encumbered the roof, as well as twenty-eight more which approached too near the wall of the temple. When the whole has been isolated from its present surroundings by a massive wall the work of restoration at Edfou will be accomplished." The wall is not yet built; the village huts come close to one side, and on the other side towers a heap of rubbish nearly to the top of the 125-foot pylon.

The same eminent authority tells us that "Karnak, more than any other Egyptian temple, has for a long time suffered from infiltration of the Nile, whose waters, saturated with niter, eat into the sandstone. . . . The time may come when, with crash after crash, the columns of the magnificent hypostyle hall, whose bases are already three parts eaten through, will fall, as have fallen the columns in the great court in front of it." At Karnak the earth is seven feet deep around the base of the columns, and heaps of rubbish rise close to the

¹ While the present law in Greece works well in the case of important monuments, yet when hundreds of small objects, almost identical, are found together, a few score of which would be sufficient for Grecian museums for all time, it becomes a matter of regret that some of these cannot be exported for the enrichment of foreign collections. The treasury of the National Museum could be benefited by the sale of articles which now only crowd its shelves in useless duplicate. So many objects found in Egypt

are of this class that a law absolutely restricting the exportation of all antiquities would not only be continually violated (without much more severe customs' examinations than are now enforced), but it would be unnecessary. The present law which allows only antiquities under the seal of the Egyptian Museum to be removed is an admirable one, but it is almost a dead letter, and it is said that £20,000 worth of antiquities are exported every year.

outer walls and almost level with their tops. Fragments, not too large to be moved with comparatively simple machinery, and the proper position of which could be accurately determined by their inscriptions, lie everywhere; heads of statues, and even parts of obelisks, could be put in place. No one who sees the results of the work done in excavating the columns of Luxor, and in some cases reconstructing parts with brick and plaster, can doubt that similar labor put upon Karnak would repay a hundred fold in our day, and it might be the means of preserving to the world its grandest ruin. A recent commission has estimated that \$15,000 spent upon Karnak will make it safe from immediate danger and practically restore it, and \$42,500 is asked for by this commission as the minimum amount imperatively needed for the preservation and protection of all the most important temples.

Egypt must be aided in guarding her treasures. There is already a system of surveillance, and a tax of one pound is levied upon every Nile traveler to contribute to the preservation of the temples. But the ignorance and cupidity of the Arab guardians is apparent to every tourist: for a sufficient *bakshish* they can easily be induced to leave the traveler while he gratifies his own private bump of acquisitiveness by chipping away a piece of sculpture or cutting out a cartouche. A trustworthy man, of some education, should be in charge of each temple, and held responsible for damages to its walls. To such a man might be intrusted the work of continuing excavations and clearing away rubbish by slow degrees, as at Pompeii, so that no great amount of money need be spent at once; and, as at Pompeii, a new element of interest would constantly be added for the tourist.

The government does all it can with the limited means at command, but Egypt is "a nation meted out and trodden down," and the movement to preserve her monuments and to keep them within her own borders as the common heritage of all nations must come from without.

William W. Ellsworth.

COMMENT.

THE original spoiling of the Egyptians history considers to have been a creditable act; but the "spoiling" by our nineteenth-century vandals in Egypt is not only discreditable but barbarous. The Egypt Exploration Fund, whose vice-president for France is Maspero, is in hearty sympathy with the English society for the preservation of the monuments of Egypt, and some of its officers have started a fund for that purpose. Its managers have repeatedly called attention to the terrible mutilation of sculptures by relic fiends or by those who fill their orders. Professor Sayce, of our Fund, and Colonel Ross write earnestly from Egypt, extracts from their letters appearing in my letter on "Civilized Barbarism," in the "Boston Post" of March 19, 1890. Mr. Ellsworth does not express as much indignation as I then expressed. I closed with these suggestions:

I hope our American press will disseminate these painful facts as to the destruction of precious historical monuments at the instance of vandals who visit Egypt, or who pay gold for monuments that must be had at any and all sacrifice. First, I hope thereby our people will be more careful how they give *carte blanche* orders for mon-

umental remains, without regard to how they are to be obtained. Secondly, that that perfection of pleasure-giving, instruction-imparting tours, a trip up the Nile, may not lose, at least in part, its infinite charm—that of the inscriptions, pictorial representations, ethnographic bas-reliefs of a great people and contemporaneous races of 2000 to 6000 years ago—to all educated people who would profit by their inspection of the remains of ancient Egypt. Lastly, that the importance of exploration and research, such as the Egypt Exploration Fund carries on, may be strikingly emphasized—and more decipherments be made ere it is too late. For its work is above as well as under ground. Professor Sayce declares that "it is evident that whatever inscriptions there are above ground in Egypt must be copied at once if they are to be copied at all."

Brimful with general sympathy for Mr. Ellsworth's views, I must yet touch judiciously on a few of his special ideals and intimations. Egypt as a colossal Pompeii means a colossal and impossible fund to preserve absolutely intact her monumental treasures. Hence the museum at Cairo, to preserve the portable treasures, has a grand mission aside from its value as a great museum. Such is the greed of the Turk, Egyptian, Arab, that the greater the fund the greater would be their steals; such is iconoclasm in Egypt that it is religiously bound to deface statues and inscriptions. The most that we can accomplish, with a liberal outlay annually, will be the protection of the chief temples and sites. Let us spend \$25,000 to \$50,000 a year for this purpose; but who will give the money?

The most valuable of the portable sculptures discovered at Bubastis were removed to save them from certain destruction. There was no money for guards to protect them by night and day; much less for building a museum "for the delight and instruction of visitors for all time." The best pieces were reserved for the Cairo Museum, which always has the pick of all "finds" in Egypt, and whose director grants the right to explore for science and his museum's benefit. Most of the objects taken from Egypt by the Fund, by permission of the director, are duplicates which he does not wish, but which are of great value to other museums. Comparatively few people can see Egypt; but hundreds of thousands of people can and do see the collections elsewhere, to their great profit in many cases.

Greece is not a typical case: with fifty fold its monuments and every Greek an iconoclast, the cases would be parallel perhaps. No little triangular jealousy exists between English, French, and German savants in Egypt,—the natural *odium archaeologicum*,—some of whom are sure to let the tongue wag under the influence of the green eye. I notice that sometimes tourists' letters unwittingly catch the glitter of that eye. Let us save the monuments of Egypt; let us explore; let us use the duplicates to make our own "Egypt at Home" for study and profit; all of which is consistent and may be accomplished.

Wm. C. Winslow.

EGYPT EXPLORATION FUND, BOSTON.

General Lee and the "Yankee in Andersonville."

AS a constant reader of THE CENTURY, "A Yankee in Andersonville," by Dr. T. H. Mann, comes under my observation in the July number. The article in

question seems a fair and faithful relation of facts; indeed, as I was in Lynchburg at the time he mentions, I know his account of his experience there is as he states it. Any one who experienced the necessary and often unnecessary horrors of many of the Northern "pens" where so many suffered and died can readily believe, as I do, all he says of Andersonville. But in speaking of seeing General R. E. Lee "for the first and only time in my life," he is evidently inaccurate. Dr. Mann says:

He [Lee] sat upon his horse carelessly, with one knee resting upon the pommel of the saddle, and leisurely smoking a cigar. He appeared a middle-sized man, with iron-gray hair and full gray beard, not very closely cut; as fine-looking a specimen of a man and soldier as I ever saw. He remarked, as we filed past him, "Am sorry to see you in this fix, boys, but you must make the best of it." His tone was kind, and spoken as though he really sympathized with us, as I have no doubt he did.

It is kind in Dr. Mann to think and speak thus of our Lee, but it is plain he never saw General Robert E. Lee. All who knew him will say this picture is not true to nature. "Jeb" Stuart's favorite attitude, sometimes indeed under fire, was to sit "carelessly, with one knee resting upon the pommel of his saddle," and maybe "leisurely smoking a cigar,"—though I never saw him smoke,—but General Lee never did so undignified a thing as this in his life. If there was any trait of his character that was always conspicuous it was dignity, and while on duty he was the sternest man I ever saw. In the social circle he was most courteous and affable. That he should have addressed Federal prisoners gratuitously at all was very unlike him; but if he had, it certainly would not have been in that free-and-easy, glib style quoted. It would have been very much more like him to have used the term *men*, but to have called them "boys" is altogether inconsistent. That he "sympathized" with the prisoners no one will doubt who correctly estimated the goodness and noble-heartedness of the man. His humanity and sympathy for his suffering "people"—a term of his own that he always used in speaking of his soldiers—in my humble judgment alone prevented him from being what Stonewall Jackson was, the greatest general of either army. I was connected with General Lee's army for four years nearly, and I believe if he had been a smoker I would have known it. And I am informed by one who knew General Lee better than I could that he never smoked a cigar in his life.

Very likely Dr. Mann really saw one of the many bogus counterfeits of General Lee, as I have many a time seen them attitudinizing in the conceit that they resembled him in personal appearance, which would explain some inconsistencies of an otherwise interesting and very likely faithful war reminiscence.

Dr. Mann, in speaking of his two-days' railway trip to Danville from Lynchburg (a two-hours' ride now), mentions that it was his only experience of riding in a passenger coach, "box-cars" being used on all other occasions. If he had known how few coaches there were in the Confederacy he would not have been surprised. Our troops, and indeed the sick and wounded, were from necessity nearly always transported in box-cars; and on one occasion as early as 1862, when our resources were not nearly so exhausted, I saw Jefferson Davis get out of a box-car at Gordonsville, having rid-

den from Culpeper, the only other occupants of the car being Federal prisoners captured from Pope's army.

And if Dr. Mann had known how scarce "raw corn" was as late as 1864, he would not have commented on its being issued as rations to prisoners, when very likely our soldiers in the field (many of them) were suffering even for raw corn. I could give some personal experience here in point.

One more item, which I must say with all respect is beyond my understanding, how it was possible for the prisoners at Andersonville to dig wells (not tunnels),—perpendicular wells, and a number of them,—eighty and even a hundred feet deep, in the hard clay soil, with only pieces of old canteens as digging implements. I can believe that the "mass of maggots" was "from one to two feet deep," but there must be some mistake about the depth of the wells or the pieces of canteens.

*E. A. Craighill, M. D.,
Late Private Co. G., 2d Va. Inf'y, 1st (Stonewall) Brigade
A. N. Va., and Ass't Surgeon C. S. A.*

LYNCHBURG, VA.

DR. MANN'S REJOINDER.

It is possible, of course, that I did not see General Lee, but the picture he made sitting upon his horse in the twilight of May 5, 1864, has not yet been effaced from my mind. Dr. Craighill will agree with me that the men of either army, who stood up for four years and took the brunt of battle, were not in the habit of seeing apparitions.

The Confederate army did suffer much from lack of rations, and no doubt at times from lack even of raw corn, but the cause was lack of transportation rather than of such supplies within the Confederacy. There was corn enough rotting in the fields ungathered, and in the bins, within twenty miles of Andersonville to feed properly every prisoner in that stockade.

Why could not a well one hundred feet deep be dug with a split canteen for a shovel and an old case-knife for a pick as easily as could a tunnel? No doubt it puzzled a Virginia planter in ante-bellum days to imagine how a New England Yankee could obtain a living from the bleak and rocky hills he inhabited; yet he did it by digging away, in sunshine and rain, every day in the year except Sundays, Fourth of July, Thanksgiving, Fast Day, and "Llection."

"The Builders of the First Monitor."

As one of the executors of the late Captain John Ericsson, I feel called upon to correct some of the statements made by Mr. G. G. Benedict in his article in *THE CENTURY* for March, 1890. From documents in my possession, and facts of which I have personal knowledge, it is clear that Mr. Benedict is seriously at fault in many of his statements.

It is not true, for example, that Mr. C. S. Bushnell had less "practical experience and wealth" than his associates. His practical experience in vessels dated from his boyhood, when at sixteen years of age he was master of a large vessel, and a large owner and extensive builder in sailing and steam ships up to the time when he became contractor for the ironclad *Galena*,

of which Messrs. Winslow and Griswold were subcontractors under him for the iron plating.

Captain Ericsson's most intimate friend, Mr. C. H. Delamater, is entitled to the credit of bringing the plan of the *Monitor* to the attention of Mr. Bushnell, who no sooner saw and appreciated it than he carried it to Hartford, Connecticut, where the Secretary of the Navy, Hon. Gideon Welles, on a certain Friday early in September, 1861, urged him to take the plan immediately to Washington and lay it before the Government. This Mr. Bushnell did, not stopping at his home in New Haven, but arriving at the capital on Sunday morning. After breakfast he invited Mr. Winslow and Mr. Griswold to take a ride with him, that he might, undisturbed, explain to them the magnitude of his discovery. To their credit it may be said that this was an easy task, and it was agreed that all three should call upon Mr. Seward and Mr. Lincoln the following (Monday) morning. Mr. Seward gave them a letter of introduction to Mr. Lincoln, and the latter was so much pleased with the plan that he promised to meet them the next day (Tuesday) at the Navy Department, and use his influence with the Naval Board for its adoption. Promptly at eleven o'clock Mr. Lincoln appeared, and, after listening to the adverse criticism, expressed his opinion that "there was something in it, as the Western girl said when she put her foot into her stocking!" After the President had withdrawn, Messrs. Bushnell and Winslow secured from Admiral Smith and Commodore Paulding a promise to sign a favorable report, provided Captain Davis — the remaining member of the committee — would join them. This he declined to do, and the enterprise seemed hopelessly blocked. Mr. Bushnell, after consulting with Secretary Welles, then started for New York, and by persistent persuasion succeeded in inducing Captain Ericsson to go on to Washington, where he had no difficulty in satisfying Captain Davis of the stability of the *Monitor*, and inducing him to join his associates in recommending a contract for its construction.

Mr. Benedict's statements, that "Days lengthened into weeks while Bushnell labored ineffectually to remove the prejudices and obtain the approval of the Board," that "His own efforts having proved thus unavailing," he applied to Messrs. Winslow and Griswold, and that they "decided to take the scheme past the Naval Board, directly to the head of the nation," etc., are wholly misleading. The fact is, that the entire enterprise was managed with the greatest expedition. The plan was never presented to the Board until the Tuesday morning when President Lincoln met Mr. Bushnell and his associates at Admiral Smith's office, and was accepted three days later, after Mr. Ericsson's arrival from New York.

"Mr. Bushnell says that [the hard conditions exacted by the Government were] never an embarrassment to Captain Ericsson and himself. If so, may it not have been because their pecuniary risk was so much less than that of their associates?"

The real reason was because of the unbounded faith which Ericsson had — and which Mr. Bushnell shared — in the ability of the vessel to do all that was required of her. It may also be said that Mr. Bushnell had secured other parties to take the place of Messrs. Winslow and Griswold in case they finally refused to sign the contract. After hesitating for a week, they

decided to share in the enterprise, but only on condition that Mr. Bushnell should secure Mr. Daniel Drew of New York and Hon. N. D. Sperry of New Haven as bondsmen for all parties. Mr. Bushnell was both able and willing to take all the risks involved in his share of the work, and has always felt more than satisfied with the public appreciation of his effort to aid the country in its darkest days. He has never had the slightest wish to appropriate the lion's share of the credit, and joins most heartily with Mr. Benedict in honoring all gentlemen whose names are given such well-earned distinction in Mr. Benedict's article.

George H. Robinson.

The Flag first hoisted at Mobile.

THE JUNE CENTURY, page 309, speaks of the flag hoisted by Lieutenant De Peyster over Richmond as "the same one that had been first hoisted at Mobile on the capture of that city."

Now the *first* flag hoisted over Mobile was hoisted by men from the ironclad *Cincinnati*. On April 12, 1865, a fleet of transports took the force that had been operating on the east side of Mobile Bay against Spanish Fort, reported to be about fifteen thousand men, over to the west side of the bay. The naval force accompanied them, ready for action. On landing, a white flag, or its equivalent, was found on every house. The citizens reported Mobile evacuated. Two boats left the *Cincinnati* to hoist a flag over one of the batteries in the harbor. The gig commanded by Acting Master J. B. Williams, executive officer, reached Battery McIntosh first and hoisted the flag there. They found everything in order except that the powder had been thrown into the bay before the evacuation. After some little time spent in rummaging, the two crews started for the city. They found no opposition to their landing, and hoisted the ensign they carried on the roof of the Battle House, climbing up on each other's shoulders to get to the flagstaff on the roof. Twenty-five minutes after our ensign was hoisted a party of cavalry came tearing in, their horses all in a foam. They went up to the roof of the custom house, across the street from the Battle House, and the first thing they saw was our flag and our men across the way. They were chagrined, and set up the flag they bore against a chimney, where it could not be seen from the street. Our men went over and helped them hoist it where it could be properly seen, then we took down our ensign and returned to the ship. Our flag was hoisted while the mayor was surrendering the city.

Ambrose S. Wight,
Late Clerk to the Commander of the "Cincinnati."
LINDEN, MICHIGAN.

A Letter from Lincoln when in Congress.

THE following copy of an autograph letter of Congressman Abraham Lincoln to the Hon. Josephus Hewett of Natchez, Mississippi, evinces a spirit of fairness and kindly feeling towards the South, and may be found of interest to readers of THE CENTURY. The original is in possession of Mrs. M. E. Gilkey of this place.

DUNCANSBY, MISS.

L. L. Gilkey.

WASHINGTON, February 13, 1848.

DEAR HEWETT: Your Whig representative from Mississippi, P. W. Tompkins, has just shown me a

letter of yours to him. I am jealous because you did not write to me—perhaps you have forgotten me. Don't you remember a long black fellow who rode on horseback with you from Tremont to Springfield nearly ten years ago, swimming our horses over the Mackinaw on the trip? Well, I am that same one fellow yet. I was once of your opinion, expressed in your letter, that presidential electors should be dispensed with, but a more thorough knowledge of the causes that first introduced them has made me doubt. The causes were briefly these. The convention that framed the Constitution had this difficulty: the small States wished to so form the new government as that they might be equal to the large ones, regardless of the inequality of population; the large ones insisted on equality in proportion to population. They compromised it by basing the House of Representatives on *population*, and the Senate on States regardless of population, and the execution of both principles by electors in each State, equal in number to her senators and representatives. Now throw away the machinery of electors and this compromise is broken up and the whole yielded to the principle of the larger States. There is one thing more. In the slave States you have representatives, and consequently electors, partly upon the basis of your slave population, which would be swept away by the change you seem to think desirable. Have you ever reflected on these things?

But to come to the main point. I wish you to know that I have made a speech in Congress, and that I want you to be *enlightened* by reading it; to further which object I send you a copy of the speech by this mail.

For old acquaintance' sake, if for nothing else, be sure to write to me on receiving this. I was very near forgetting to tell you that on my being introduced to General Quitman and telling him I was from Springfield, Illinois, he at once remarked, "Then you know my valued friend, Hewett of Natchez"; and on being assured I did, he said just such things about you as I like to hear said about my own valued friends.

Yours as ever,

A. LINCOLN.

Horace Greeley at Lincoln's First Nomination.

ON reading "The Inside Facts of Lincoln's Nomination" in the July CENTURY, I am reminded that I was in that large house in the Chicago "Wigwam" the day Lincoln was nominated, and was very desirous of the nomination of William H. Seward, as were a large number with me from Wisconsin. After the nomination of Mr. Lincoln, before proceeding to the nomination of Vice-President, the convention adjourned until the afternoon. I went from the convention to the Tremont House. Shortly after arriving there Horace Greeley came into the reception hall of the hotel with some of his friends. I then thought his face never showed more feeling of triumphant satisfaction that his political antagonist was defeated, that Seward and Thurlow Weed were humbled. I noticed this the more as I knew of the bitter feeling existing between Greeley and Seward and Weed.

Mr. Greeley's friends were gathering around him in the hall, congratulating him on the result. I heard one ask him: "Now what next? Who is it best to bring forward for Vice-President?" Mr. Greeley said, "The friends of Mr. Seward are very sore, and they must

have their own way as to Vice-President." On being asked if he had in his mind the proper name, Mr. Greeley put his open hand to the side of his mouth and in an undertone said, "Hamlin of Maine"; and Mr. Hamlin was nominated in the afternoon.

COLORADO SPRINGS, COL.

G. H. Stewart.

An Error in "A Single Tax upon Land."

In his article on "A Single Tax upon Land," in the July CENTURY, Mr. Edward Atkinson says:

It was presented more than a century since by the economists of France known as the physiocrats; it was applied in France under Turgot, before the French Revolution, with very disastrous results.

This is a remarkable statement for a man to make who "has endeavored, to the best of his ability, to explore the subject," for the proposition of the physiocrats holds about the same relation to the modern proposition as Fulton's steamboat holds to the *Umbria*. Besides, it was not applied by Turgot, though he attempted an approach to it, and as a result he was swept out of power by the privileged classes whose monopolies were threatened.

Henri Van Laun says in "The French Revolutionary Epoch," Vol. I., p. 35:

At all events, Turgot, "the man with the brain of a Bacon and the heart of a Chancellor de L'Hôpital," is regarded as the likely savior of France. His fame had preceded him, and this led the people to expect a renewal of administrative marvels, such as his intendants of Limoges brought to light. If regeneration without a revolution had been possible for France, Turgot would have accomplished it. Plans vast and numerous, comprising everything the Revolution afterwards effected, were incubated: the abolition of feudal rights, of laboring upon the highways, vexatious restrictions of the salt system, interior imposts, liberty of conscience and of the press, unfettered commerce and industry, disestablishment of the monastic orders, revision of criminal and civil codes, uniformity of weights and measures, and many others.

When at last Parliament was convened (see p. 41),

to them Turgot, with honest straightforward eloquence, unfolds his scheme. "No bankruptcy, no increase of imposts, no loans"; to which are added free trade in corn, the abolition of gilds, and last, but not least, equality of territorial imposts for all. What matters it to them that in less than two years, with provisional measures of this kind, he has paid twenty-four million francs to the public creditors, redeemed twenty-eight millions of installed money, and moreover discharged fifty millions of debt. Let him do so again, but not ask them to abate one iota of their privileges. They refuse to be taxed like the common herd; they consider such demand preposterous, and flatly decline to listen to it.

As a last resort Turgot prevails upon the king to register the edicts in a bed of justice, but the pressure of the privileged classes is so great that Turgot is compelled to resign (p. 44).

Good Malesherbes, Turgot's trusty helper, disgusted with all these vile cabals, voluntarily quits the Ministry; the latter, more courageous, waits until he is sent away, uttering these memorable words at his first dismissal: "Sire, the destiny of kings led by courtiers is that of Charles I."

Says John Morley, "Critical Miscellanies," Vol. II., pp. 150-151:

He suppressed the corvées and he tacked the money payment which was substituted on the Twentieths—an impost from which the privileged classes were not exempt.

This was about as near to the *impôt unique* as the privileged classes permitted him to get.

Leon Say in his work on Turgot, Anderson's translation (p. 205), says :

Calonne's territorial subvention, bearing upon all land owners and upon all estates without exception or privilege, was nothing more than the land tax of which Turgot was developing the plan at the very moment of his dismissal, and which was to have been the object of his next reform.

James Middleton.

NEW ORLEANS.

MR. ATKINSON'S CORRECTION.

MR. JAMES MIDDLETON'S Open Letter, which I am glad to see in print, gives me the opportunity to correct the error in my article on the "Single Tax upon Land" and in the rejoinder to Mr. Henry George, to which Mr. Middleton refers.

The single tax, or what the physiocrats call *l'impôt unique*, was not applied in France under Turgot; that is, it was not put into practice. The services which Turgot rendered are rightly and fully stated in the extracts given by Mr. Middleton. *L'impôt unique*, or the single tax advocated by the physiocrats, may or may not have been of the same nature as the single tax on land valuation now proposed by Mr. Henry George. It was, however, based upon the same idea, in which Turgot shared, that all wealth is derived from land.

I may rightly give an explanation as to how this error crept into my copy and into THE CENTURY. You may remember that the first draft of this article upon the "Single Tax upon Land" was submitted to you, and while you liked it and desired to publish it, it was too long; neither did it satisfy myself that it was in a sufficiently popular form to be easily comprehended.

In that original draft I attributed the issue of the

French *assignats*, the paper money of the French Revolution which collapsed in such a disastrous manner although secured upon the confiscated lands of the nobles, to the misconception in regard to land which had been held by the physiocrats and sustained or applied by Turgot. In making the necessary excision I overlooked the fact that I left the statement in an incorrect form, as if a single tax on land valuation, corresponding to the plan of Mr. George, had been actually put into practice in France. This is not the fact; and the simplest way is to admit the error. Even when writing my short rejoinder to Mr. George, I failed to observe that by my excision I had left the paragraph in its erroneous form.

Edward Atkinson.

BOSTON.

George D. Prentice and S. S. Prentiss.

MR. JOHN GILMER SPEED writes to us that although Mr. Joseph Jefferson's remarks as to Mr. Prentice's dueling prowess reflect the opinion of others with better opportunities to judge, nevertheless Mr. Prentice was bravely and consistently opposed to what he called "the miserable code that is said to require two men to go out and shoot at each other for what one of them may consider a violation of etiquette or punctilio in the use of language." Mr. Speed says: "Mr. Prentice had on more than one occasion to defend himself from attacks made upon him in the streets, but he was never the aggressor in such fights."

With regard to S. S. Prentiss (who, by the way, was lawyer, orator, and statesman, but not an editor), letters from lawyers state that while he did fight two duels with General Foote, he fought no others, and was really opposed to the practice; yielding in these cases to what Dr. Nott in his sermon on the death of Hamilton termed "the force of an imperious custom."

Observations.

To know a thing we must see it as a whole; to understand it we must see it as a part.

WHETHER I shall be unfortunate depends also on others; whether I shall be unhappy depends only on myself.

EVEN mine enemy can sympathize with my grief; but only my friend can sympathize with my joy.

HEAVEN is a place into which the more I push others the more I am led myself.

TWO men have no need of philosophy—those who have no leisure for it, and those who have.

Ivan Panin.

Some Bookish Rhymes.

AN UNCUT COPY.

WHEN I was young I sent my friend a copy of "My
Verses,"
And when he died he left his books to me, dear to
his heart.
To-day I looked them over all, and find—ten thou-
sand curses!—
My book is there and no two leaves have e'er been
cut apart.

AN INCONSISTENCY.

THE bibliophile who loves his margins wide—
Who grudges e'en to type an inch or two—
Most strangely has not ever stepped aside
To read with glee a virgin blank-book through.

THE GRANGERITE.

HE says he's fond of books as of himself—
This man who never yet has hesitated
To hack and cut a dozen books for pelf
Wherewith *one* may be extra-illustrated!

John Kendrick Bangs.

A Reader's Choice.

LET critics praise the thoughtful prose
Of warriors and of sages,
Let maidens linger o'er the verse
Wherein the poet rages —
From these I turn without regret
To Advertising Pages.

The authors drive unwilling pens
In search of novel plots;
The poet's lines are haunted by
The ghosts of those he blots;
We smell the artist's midnight oil
In all his lines and dots.

But oh! the Advertiser,
He seeks untraveled ways —
We feel the eager wish to please
In every word he says;
The other's toil is hired,
For leave to speak *he* pays.

No matter how inspired
The poet may seem to be,
For every foot I give his price —
Each throb is charged to me;
The Advertiser's efforts
Are always thrown in, free.

They greet one with "Good-morning!"
Sweet words of cheer and hope! —
(What matter that they're followed
By hints of toilet soap?)
They offer us great padded chairs
In every kind of slope.

A cup of chocolate is brought
Upon a dainty tray;
Assorted jack-knives then are shown
In bluff and easy way;
You're asked to see Niagara,
And pressed to spend the day —

There's no time to be weary:
Before one has a chance
Up pops a "gent" in shirt-sleeves,
And with a backward glance
Displays invitingly a pair
Of his "Three Dollar Pants."

Typewriters by the dozen
Dazzle our eager eyes,
And each one "holds the record,"
And each one "took the prize";
And when we read of any
The others we despise.

Of powders made for baking
There's but one pure in ten,
As proved by affidavits
Of scientific men;
You turn the page — and all's disproved
By men as wise again.

Behold a Queen Anne cottage
Where Cupid loves to dwell!
'T is built for really nothing —
Just how, "our book will tell";
And here are patent shingles
To roof the pretty shell.

Lo! fountain-pens, unnumbered,
"On trial," and the rest,
All used by Twain and Tennyson,
All guaranteed the best,

All worth their weight in — promises
After a six-months' test.

We read of schools on mountain tops,
Of railroads to the sea,
Of cameras, revolvers,
Of tricycles and tea,
With gowns and gaiters, watches, clocks,
Each on a guarantee.

For agents, all are begging,
Though fortunes great are made
In books upon commission
And "all expenses paid";
They offer farms for nothing
On maps and plans displayed.

In winter — here are heaters
With patent grate and flue;
In summer — ice-cream freezers,
Refrigerators, too;
And here are Brobdingnagian fruits,
That grow in spite of you.

Oh! could I own a check-book
In Russia, edged with gold,
Backed by some banker's well-stored vaults,
And all his wealth untold,
I'd write to every one of them
A letter fierce and bold —

I'd order from each dealer
All he did advertise,
And all these dreams of luxury
At once I'd realize,
Then sit and open bundles
In a sort of Paradise!

Tudor Jenks.

A Song of a Square.

It's a bright little spot in the heart of the town,
And the sun in its wanderings often looks down
On the fledglings of fashion who constantly fare
With jesting and laughter through Rittenhouse Square.

Whole beves of beauties in glistening brocade
Stroll languidly under the sycamores' shade
To gossip and chatter while taking the air
And flaunting their feathers in Rittenhouse Square.

While loitering over the greensward there go
In endless procession fop, gallant, and beau
Tricked out like Sir Plume in his ruffles, to stare
At the gay promenaders of Rittenhouse Square.

But one little maid in the glittering host
Is humble and poor. All the wealth she can boast
Is the gold that shifts over her shimmering hair
When sunshine is plenty in Rittenhouse Square,

Yet not a fine lady of any we meet
Has glances so cheery or smiles half so sweet
As those she flings over her shoulder at care
When walking beside me through Rittenhouse Square.

O Nelly, sweet Nelly! The proud world goes by,
But what is its scorn when we know, you and I,
That when April is white upon apple and pear
There'll be wedding-bells ringing in Rittenhouse
Square!

Mary E. Wardwell.

In Cap and Bells.

IN motley, I — a jester, I —
 Time's fool with bauble, asses' ears,
 And peeping from my hood there blears
 A face all seamed and scarred with smiles —
 The footprints of the miles and miles
 Of weary jests,
 Jest at Master Time's stern hests.

IN motley, I — a jester, I —
 Living to make King Time each day
 Crack his pale cheeks with laughter gay,
 To smooth the hard cushions of his throne,
 He, the strong mastiff — I, the bone
 Crunched in his teeth,
 Ending my jests for him in death.

IN motley, I — a jester, I —
 But oh! we wear — Time's honored fools —
 Hearts of sable on life's field, gules.
 The world 's a bladder; men, dried pease;
 I, the stick, rattle them to please
 King Time away:
 But I, I am not that I play.

You like the colors of my cap?
 Marry, 't is well!
 You like the jingle of each little bell?
 Marry, 't is good!
 I 'll shake my hood

To drop you quips at your command.
 So, come to me: hold out your hand:
 But for each ringing laugh you give, I cry,
 "You are the jester, *you*: it is not I."

Esther Singleton.

Patient Griselda.

IN days of yore called Golden,
 'T was the woman was beholden
 To her husband for her high or low degree;
 He raised her to his level,
 Were he banker, bishop, devil,
 Angel, poet, alderman, or Ph. D.

So Griselda, called the Patient,
 Had to stay where she was stationed,
 Nilly willy, in her high or low degree;
 To fill my lordship's goblet,
 Or darn his holey doublet,
 Was all *she* knew of life or liberty.

To-day in late requital
 Let the husband take his title
 To distinction through his lady's high degree,
 And rank in art and science
 As professor by alliance,
 Perchance as consort of a K. C. B.

Oh, she asked not for the ballot,
 For it is not to her palate;
 But she claims her right to learning's high degree
 With doctors of divinity
 With whom she feels affinity,
 And wants a little lien on LL. D.

So, though eons she has waited,
 Is Griselda re-instated
 (Not as that patient person thought to be),
 In learning's lore man's counterpart —
 And yet we think thy woman's heart
 Thy crowning grace, Griselda, Ph. D!

Marguerite Merington.

His Old Yellow Almanac.

I LEFT the farm when mother died, and changed my place of dwellin'
 To daughter Susie's stylish house, right in the city street,
 And there was them, before I came, that sort of scared me, tellin'
 How I would find the town folks' ways so difficult to meet.
 They said I 'd have no comfort in the rustlin', fixed-up throng,
 And I 'd have to wear stiff collars every week-day right along.

I find I take to city ways just like a duck to water,
 I like the racket and the noise, and never tire of shows;
 And there 's no end of comfort in the mansion of my daughter,
 And everything is right at hand, and money freely flows,
 And hired help is all about, just listenin' for my call,
 But I miss the yellow almanac off my old kitchen wall.

The house is full of calendars, from attic to the cellar,
 They 're painted in all colors, and are fancy-like to see;
 But just in this particular I 'm not a modern feller,
 And the yellow-covered almanac is good enough for me:
 I 'm used to it, I 've seen it round from boyhood to old age,
 And I rather like the jokin' at the bottom of each page.

I like the way the "S" stood out to show the week's beginnin'
 (In these new-fangled calendars the days seem sort of mixed),
 And the man upon the cover, though he wa' n't exactly winnin',
 With lungs and liver all exposed, still showed how we are fixed;
 And the letters and credentials that were writ to Mr. Ayer
 I 've often, on a rainy day, found readin' very fair.

I tried to find one recently: there wa' n't one in the city.
 They toted out great calendars in every sort of style;
 I looked at 'em in cold disdain, and answered 'em in pity,
 "I 'd rather have my almanac than all that costly pile."
 And, though I take to city life, I 'm lonesome, after all,
 For that old yellow almanac upon my kitchen wall.

Ella Wheeler Wilcox.

THE STORY OF A MAGAZINE

[Reprinted, by permission, from "Paper and Press," of Philadelphia.]

F the many successful magazine ventures of to-day, none is perhaps more remarkable than that of *The Ladies' Home Journal*, of Philadelphia, which has now attained an actual circulation larger than any magazine in the world.

The *Journal* was started in 1883, by Cyrus H. K. Curtis, as an eight-page paper, at twenty-five cents per year. The first year's result was 25,000 yearly subscriptions. During the next six months it doubled this circulation. In 1886, when it had reached a circulation of 400,000 copies, the price was increased to fifty cents per year, and as its price was doubled so again in a year increased the subscription list, until last year it averaged 542,500 copies per month, eclipsing, in the short period of seven years, the largest circulation ever attained by any periodical in the world.

On July 1, 1889, it raised its subscription-price to \$1 per year. Only a trifling effect was felt at first, while since that time, during the first six months of the present year, exactly double the number of subscriptions have been received to that of a corresponding time last year. It is doubtful whether the history of any periodical of to-day can show an equally wonderful result. It is more than likely that with the end of 1890 it will close its books with 600,000 paid subscribers, while its news-stand sales, which last month amounted to 57,000 copies, will, by liberal advertising, probably be doubled.

From a modest 20 x 25' loft room, it has grown to occupy eight stories of the two buildings at 433-435 Arch street, Philadelphia.

The statistics of such a magazine are interesting.

For example, it requires nine presses running an entire month to print a single edition. It consumes, during a year, more than 30,000 reams of paper. It employs over 5000 agents and canvassers, and has an actual working force of over 300. Of the sixty civilized countries of the globe, it has paid-subscribers in forty-six. It goes into over 35,000 post-offices of the United States, and into nearly 1000 additional in foreign lands.

In its editorial department it employs sixteen salaried editors, and has a special force of over eighty-two editorial contributors. It uses the material of forty authors in a single issue. These authors include the best-known names in literature, as, for example, Mrs. Lew Wallace, Mrs. Adeline D. T. Whitney, Sarah Orne Jewett, Mrs. Burnett, Susan Coolidge, Mrs. Henry Ward Beecher, Margaret Deland, "Josiah Allen's Wife," Marion Harland, Elizabeth Stuart Phelps, Mrs. Alexander, Dr. Talmage, Mary J. Holmes, Edward Bellamy, Ella Wheeler Wilcox, Anna Katharine Green, Max O'Rell, Harriet Prescott Spofford, Robert J. Burdette, Edna Lyall, and almost every popular author of note in the literary world.

The *Journal's* staff of regular salaried editors include Dr. T. DeWitt Talmage, Mrs. Lyman Abbott, Mrs. Margaret Bottomo, Eben E. Rexford, Kate Upson Clark, Kate Tannatt Woods, Mrs. Louisa Knapp, Mrs. Isabel A. Mallon, Mary F. Knapp, Emma M. Hooper, Elizabeth R. Scovil, with Mr. Edward W. Bok as Editor-in-Chief.

It employs over thirty of the most famous artists in a year; artists like W. L. Taylor, W. St. John Harper, Alice Barber, Frank T. Merrill, W. Hamilton Gibson, and others of equal skill and fame.

In its literature it appeals, as its name implies, to women and home, and its tone is kept high and pure. It is found alike in the boudoir of New-York's most fashionable women and in the cabin of the far Western rancher's wife, and by editorial dexterity caters and satisfies both of these extreme tastes. Its widely-extended influence has been judged by travelers, who have found copies of the *Journal* in the border towns of Asia, in the villages of the Russian Steppes, and on the coast of Africa. Probably no other magazine penetrates so thoroughly into the furthestmost parts of the earth.

The *Journal* is thoroughly optimistic, and as its publisher says: "We believe in a cheerful life, a bright spirit, and a happy home."

With such a motto as its guiding star, it is not strange that *The Ladies' Home Journal* is happy with its half-million subscribers, and its two and a-half millions of readers each month.

THE "JOURNAL'S" PROPRIETOR.

IT seems only natural to associate a number of men in connection with the ownership of such a prosperous property plant as *The Ladies' Home Journal*, and it is a continual matter of surprise in the business world when it is stated that the *Journal* is the sole property of one man. This man is Cyrus H. K. Curtis, who founded the *Journal* and is its present owner and publisher. Mr. Curtis is a typical, energetic "Down-Easter," being born in Portland, Maine, just forty years ago on the 18th of June last.

His career is one of the best modern instances of success won by energy and hard work.

He was twelve years of age when he turned his attention to the world of periodical literature. He was a school-boy, but outside of those hours when not laboring with problems of geography and arithmetic, he sold newspapers. "Extras" were numerous in those war-days, and young Curtis took advantage of the times. He soon built up for himself a lucrative "news route," and success in this led him to try his hand at publishing a paper of his own. The result was a unique production. It was 6 x 3 inches in size; consisted of four pages; its title was *The Young America*, and it styled itself "the best and cheapest monthly in America." Its price was 2 cents per month, and the name of Cyrus H. K. Curtis blazoned forth as "editor and publisher."

In 1868, he removed to Boston and entered the advertising business, and subsequently became engaged in the publication of several periodicals. He had now fully set out in the business most congenial to him, and although success had crowned his work thus far, he regarded what he was passing through as simply experience for further and larger ventures.

A desire to bring himself closer into contact with New-York business men and houses led him to remove to Philadelphia in 1876. He chose this city with the shrewd observation that a man can throw a stronger light on a great metropolis from a short distance than by actual residence within its borders.

His first Philadelphia venture was a weekly periodical, called *The Tribune and Farmer*. This period-

ical he conducted successfully until the idea of *The Ladies' Home Journal* occurred to him, and, as stated on the preceding page, on December 1, 1883, the first number was issued of the periodical which in seven years was destined to astonish the literary world.

Mr. Curtis is a firm believer in generous advertising, and no magazine of to-day is advertised on such a large and extensive basis. He makes his advertisements attractive, gives them plenty of space, and he may be said to be one of the best advertisement writers of the present time. As he says himself, "I believe in taking my own medicine in this respect. I want business men to advertise with me, and to show them that I believe in the principles I advance, I advertise largely myself."

His business principles commend themselves to every believer of honesty in commercial transactions. For any form of deception he has the most sincere

hatred, and believes that not only is honesty the best policy in business, but that it is the only one which a man can follow with any hope of permanent success. While his circulation figures are large, they are always strictly in accord with what his books will reveal to any one who chooses to verify them. Personally, Mr. Curtis is popular in the best sense of that word. His open principles attract all whom there is with them ever present a feeling of security in all their transactions with him.

He is thoroughly a domestic man and loves his home above all social pleasures. He is a member of the Union League

Club, of Philadelphia, and of the Manufacturers' Club.

His early profits from the *Journal* were invested in a magnificent home on Cooper Avenue, Camden, N. J., which was only recently completed. In its appointments it is one of the most elegant residences within a radius of many miles. Its cost was \$65,000. In this home, surrounded by every comfort, Mr. Curtis lives with his wife, one daughter, and his mother. Mrs. Curtis is a thoroughly practical housekeeper, devoted to the interests of her husband, and to the education of her daughter. The mother is naturally proud of the success which has come to her son, and in this delightful atmosphere of domestic happiness lives the owner of *The Ladies' Home Journal*—a man loved by his family, respected by his friends, and the wonder of the business world at large.

MR. CYRUS H. K. CURTIS.

THE "JOURNAL'S" EDITOR.

T was one of the best known American authors who recently remarked to a literary group in New York: "I believe that in Edward W. Bok we have the most probable successor to the late Dr. J. G. Holland of any man sitting in an editorial chair to-day"; while it was of Mr. Bok that Dr. Oliver Wendell Holmes has said: "He seems to understand authors perfectly, and knows how to get their best work better than any one I know of."

These opinions, said of a young man who has not yet reached the age of twenty-seven, are certainly remarkable. It is undoubtedly true that no young man is better known in literary circles to-day than is Edward W. Bok, the editor of *The Ladies' Home Journal*. He is perhaps the foremost of the young literary leaders of the times, and few young men have before them a future more clearly defined or so full of promise.

To find so young a man occupying the position of editor-in-chief of the magazine having the largest circulation in the world, and commanding one of the largest salaries paid to an American magazine editor, seems almost incredible. Yet this success, although it has been won early in life, has come only by hard work and persistent endeavor.

Edward William Bok was born in the seaport town of Den Helder, near Amsterdam, in Holland, October 9, 1863, and he is, therefore, in his twenty-seventh year. He was reared amid wealth and luxury. His father occupied diplomatic positions at the Royal Court of the Netherlands, and was considered one of the richest men in Holland. But reverses came, and Edward was brought to America at the age of six, unable to speak a word of the English language which he was destined to write so fluently.

Young Bok was first heard of at the age of fifteen, making a wonderful collection of autograph letters and documents of famous personages, which soon, from its uniqueness, attracted the attention of the newspapers of America and Europe. The fame of the young collector quickly spread, and he became known as "The Prince of Autograph Collectors." This collection now numbers over 20,000 pieces.

At nineteen, he started *The Brooklyn Magazine* with not enough money to pay the printer for one printed page. He struggled against all obstacles, however, and made the magazine a success in little more than a year, selling it at a good price to a Brooklyn millionaire. Mr. Bok's editorial management of *The Brooklyn* was so fresh and original that his work brought the magazine into public notice from the start.

Henry Ward Beecher soon after this became attracted to the young man, and the great preacher put much of his literary work into his hands. The closest confidence existed between Mr. Beecher and his alert protégé. At Mr. Beecher's death, Mr. Bok compiled and edited a "Beecher Memorial" for the family, which attracted wide attention. Some months previous to Mr. Beecher's death, Mr. Bok conceived the idea of a series of weekly newspaper letters

by the eminent divine. Of these the young literary manager made a success, and both Mr. Beecher and he reaped large profits. From this grew the idea of a literary syndicate, which to-day is known as "The Bok Syndicate Press," one of the most powerful literary influences in New York. These ventures were but side issues with Mr. Bok, as all were conducted during his evening hours. During the daytime he held a position with the publishing house of Henry Holt & Co., which he resigned in a year to connect himself with the firm of Charles Scribner's Sons. In four years he graduated through several positions until

MR. EDWARD W. BOK.

he was made chief of the advertising department.

After declining several lucrative offers, he accepted, in October of last year, the position of editor-in-chief of *The Ladies' Home Journal*. He has already proved one of the most enterprising and successful men now occupying an editorial chair, and his feat of quickly lifting the *Journal* into the public eye has perhaps not an equal in literary annals.

The secret of Mr. Bok's editorial success unquestionably lies in his singularly accurate knowledge of what the public wants and will read. This he knows remarkably well. He is also as good a business man as he is an editor. Perhaps no literary man has the friendship and confidence of so many celebrities. He has the name of every author of note at the ends of his fingers, knows them all personally, and can secure their best work where others will fail.

THE "JOURNAL'S" PROPRIETOR.

IT seems only natural to associate a number of men in connection with the ownership of such a prosperous property plant as *The Ladies' Home Journal*, and it is a continual matter of surprise in the business world when it is stated that the *Journal* is the sole property of one man. This man is Cyrus H. K. Curtis, who founded the *Journal* and is its present owner and publisher. MR. EDWARD W. BOK.

he was made chief of the advertising department.

After declining several lucrative offers, he accepted, in October of last year, the position of editor-in-chief of *The Ladies' Home Journal*. He has already proved one of the most enterprising and successful men now occupying an editorial chair, and his feat of quickly lifting the *Journal* into the public eye has perhaps not an equal in literary annals.

The secret of Mr. Bok's editorial success unquestionably lies in his singularly accurate knowledge of what the public wants and will read. This he knows remarkably well. He is also as good a business man as he is an editor. Perhaps no literary man has the friendship and confidence of so many celebrities. He has the name of every author of note at the ends of his fingers, knows them all personally, and can secure their best work where others will fail.

THE FUTURE OF A GREAT SUCCESS.

THE future of the *Ladies' Home Journal* must naturally be a matter of curiosity to all interested in big successes. Can such a success be carried further?—is often asked. Has not the *Journal* reached its zenith? One thing must

not be forgotten in periodical ventures: the first 100,000 subscribers are always the most difficult to secure; after that, the sailing becomes plainer and easier. The great mass of the people follow a success. They like, even as a modest subscriber, to be identified with it. This is a potent fact in the history of all successful ventures, literary or otherwise.

The aim of the *Journal's* publisher is to secure a subscription list of one million names. The undertaking is a large one, but so was the one he has already successfully compassed. The *Journal* has passed the half-million post; that it will reach the end of its journey—the full million goal—is almost certain. It may take a few years. The *Journal* is better and stronger to-day than it ever was. Its advertising patronage is larger, even in the face of a recent increase of rates; its editorial staff is stronger; its position in the world of periodicals is more fixed; thousands know of it to-day where six months ago it was never heard of, and, altogether, its future holds out more certainties than at its start.

It has a generous and far-seeing publisher who is not afraid to use printer's ink; a bright and creative editor is at its head, and with the go-aheadness and push evident in all its departments, the *Journal* is destined to be, in every respect, the literary wonder of the nineteenth century.

As late as two years ago it was generally regarded as a "bubble," which the slightest financial friction would explode. To-day such a remark is never heard in connection with it. The *Journal* has the thorough confidence of the entire business and reading public.

It is an established success. More than that—it is a success which has not a parallel in the periodical world, and its future seems precisely what its publisher and editor choose to make it. Its history constitutes a literary marvel.

With such a rapidly developing country as ours, and a population wonderfully increasing, there exists no plausible reason why a home magazine catering to every pure and legitimate taste, should not reach a paid circulation of one million copies; and no periodical is in a better way of realizing this than is *The Ladies' Home Journal*.

Perhaps no magazine published to-day has so many peculiarities distinctly its own. It has been conceded, by readers and advertisers alike, to have, without doubt, the most responsive constituency ever enjoyed by a periodical. A single biographical sketch of some prominent person, for example, will bring forth from its readers as many as a thousand letters. Two years ago a sketch of a prominent woman was published, and letters are still being received by her in relation to the sketch.

A single request on the part of one of its readers for some piece of domestic information, printed in three lines agate type, brought forth, in that instance, over 800 letters. And what is true of its reading columns, seems equally true of the advertisements. A writer in *Printer's Ink*, of New-York, recently stated that from a five-line advertisement inserted once in the *Journal* over 15,000 responses were received. Cassell & Company, the New-York publishers, received 6000 answers in reply to their advertising.

The secret of all this is not difficult to find. No distance exists between those who read the *Journal* and those who make it. The closest relations seem to exist between the publisher and editor and their readers, and the interchange of letters, in this manner alone, runs up into the thousands each year.

Thus it is understood by the *Journal* readers that an article or advertisement in its pages carries with it the personal recommendation of editor or publisher. And it undoubtedly does, for one part of the periodical is as carefully guarded as the other. A doubtful advertisement would no more pass the eye of the publisher than would an article of immoral tendency receive the approval of the editor.

These are some of the points which make the *Journal* unique, and in this uniqueness lies the secret of the close relations which seem to bind this immense literary family together.

The *Journal* undoubtedly goes into tens of thousands of homes where no other periodical penetrates. In these families it furnishes the reading for every member from the youngest child to the oldest grandparent. The beneficial influence thus exerted is well nigh incalculable, it being decidedly for the good of all.

No. 2.

LIFE IN CALIFORNIA BEFORE THE GOLD DISCOVERY.

BY JOHN BIDWELL (PIONEER OF '41).

BUTTER'S BOOT. (IN THE PIONEER SOCIETY'S ROOMS, SACRAMENTO.)

THE party whose fortunes I have followed across the plains¹ was not only the first that went direct to California from the East; we were probably the first white people, except Bonneville's party of 1833, that ever crossed the Sierra Nevada. Dr. Marsh's ranch, the first settlement reached by us in California, was located in the eastern foothills of the Coast Range Mountains, near the northwestern extremity of the great San Joaquin Valley and about six miles east of Monte Diablo, which may be called about the geographical center of Contra Costa County. There were no other settlements in the valley; it was, apparently, still just as new as when Columbus discovered America, and roaming over it were countless thousands of wild horses, of elk, and of antelope. It had been one of the driest years ever known in California. The country was brown and parched; throughout the State wheat, beans, everything had failed. Cattle were almost starving for grass, and the people, except perhaps a few of the best families, were without bread, and were eating chiefly meat, and that often of a very poor quality.

Dr. Marsh had come into California four or five years before by way of New Mexico. He was in some respects a remarkable man. In command of the English language I have scarcely ever seen his equal. He had never studied medicine, I believe, but was a great reader: sometimes he would lie in bed all

day reading, and he had a memory that stereotyped all he read, and in those days in California such a man could easily assume the rôle of doctor and practise medicine. In fact, with the exception of Dr. Marsh there was then no physician of any kind anywhere in California. We were overjoyed to find an American, and yet when we became acquainted with him we found him one of the most selfish of mortals. The night of our arrival he killed two pigs for us.² We felt very grateful, for we had by no means recovered from starving on poor mule meat, and when he set his Indian cook to making tortillas (little cakes) for us, giving one to each,—there were thirty-two in our party,—we felt even more grateful; and especially when we learned that he had had to use some of his seed wheat, for he had no other. Hearing that there was no such thing as money in the country, and that butcher-knives, guns, ammunition, and everything of that kind were better than money, we expressed our gratitude the first night to the doctor by presents—one giving a can of powder, another a bar of lead or a butcher-knife, and another a cheap but serviceable set of surgical instruments. The next morning I rose early, among the first, in order to learn from our host something about California,—what we could do, and where we could go,—and, strange as it may seem, he would scarcely answer a question. He seemed to be in an ill humor, and among other things he said, "The company has already been over a hundred dollars' expense to me, and God knows whether I will ever get a *real* of it or not." I was at a loss to account for this, and went out and told some of

¹ See "The First Emigrant Train to California," in THE CENTURY for November, 1890.

² Men reduced to living on poor meat, and almost starving, have an intense longing for anything fat.

the party, and found that others had been snubbed in a similar manner. We held a consultation and resolved to leave as soon as convenient. Half our party concluded to go back to the San Joaquin River, where there was much game, and spend the winter hunting, chiefly for otter, the skins being worth three dollars apiece. The rest—about fourteen—succeeded in gaining information from Dr. Marsh by which they

exposed than any other to the ravages of the Horse-thief Indians of the Sierra Nevada (before mentioned). That valley was full of wild cattle,—thousands of them,—and they were more dangerous to one on foot, as I was, than grizzly bears. By dodging into the gulches and behind trees I made my way to a Mexican ranch at the extreme west end of the valley, where I staid all night. This was one

A BIT OF THE COAST RANGE.

started to find the town of San José, about forty miles to the south, then known by the name of Pueblo de San José, now the city of San José. More or less of our effects had to be left at Marsh's, and I decided to remain and look out for them, and meantime to make short excursions about the country on my own account. After the others had left I started off traveling south, and came to what is now called Livermore Valley, then known as Livermore's Ranch, belonging to Robert Livermore, a native of England. He had left a vessel when a mere boy, and had married and lived like the native Californians, and, like them, was very expert with the lasso. Livermore's was the frontier ranch, and more

of the noted ranches, and belonged to a Californian called Don José Maria Amador—more recently, to a man named Dougherty.¹ Next day, seeing nothing to encourage me, I started to return to Marsh's ranch.

On the way, as I came to where two roads, or rather paths, converged, I fell in with one of the fourteen men, M. C. Nye, who had started for San José. He seemed considerably agitated, and reported that at the Mission of San José, some fifteen miles this side of the town of San José, all the men had been arrested and put in prison by General Vallejo, Mexican commander-in-chief of the military under Governor Alvarado, he alone having been sent back to tell Marsh and to have him come forth-

¹ The rancheros marked and branded their stock differently so as to distinguish them. But it was not possible to keep them separate. One would often steal cattle from the other. Livermore in this way lost cattle by his neighbor Amador. In fact it was almost a daily occurrence—a race to see which could get and

kill the most of the other's cattle. Cattle in those days were often killed for the hides alone. One day a man saw Amador kill a fine steer belonging to Livermore. When he reached Livermore's—ten or fifteen miles away—and told him what Amador had done, he found Livermore skinning a steer of Amador's!

with to explain why this armed force had invaded the country. We reached Marsh's after dark. The next day the doctor started down to the Mission of San José, nearly thirty miles distant, with a list of the company, which I gave him. He was gone about three days. Meanwhile we sent word to the men on the San Joaquin River to let them know what had taken place, and they at once returned to the ranch to await results. When Marsh came back he said ominously, "Now, men, I want you all to come into the house and I will tell you your fate." We all went in, and he announced, "You men that have five dollars can have passports and remain in the country and go where you please." The fact was he had simply obtained passports for the asking; they had cost him nothing. The men who had been arrested at the Mission had been liberated as soon as their passports were issued to them, and they had at once proceeded on their way to San José. But five dollars! I don't suppose any one had five dollars; nine-tenths of them probably had not a cent of money. The names were called and each man settled, giving the amount in something, and if unable to make it up in money or effects he would give his note for the rest. All the names were called except my own. There was no passport for me. Marsh had certainly not forgotten me, for I had furnished him with the list of our names myself. Possibly his idea was—as others surmised and afterwards told me—that, lacking a passport, I would stay at his ranch and make a useful hand to work.

The next morning before day found me starting for the Mission of San José to get a passport for myself. Mike Nye, the man who had brought the news of the arrest, went with me. A friend had lent me a poor old horse, fit only to carry my blankets. I arrived in a heavy rain-storm, and was marched into the calaboose and kept there three days with nothing to eat, and the fleas were so numerous as to cover and darken anything of a light color. There were four or five Indians in the prison. They were ironed, and they kept tolling a bell, as a punishment, I suppose, for they were said to have stolen horses; possibly they belonged to the Horse-thief tribes east of the San Joaquin Valley. Sentries were stationed at the door. Through a grated window I made a

GENERAL M. G. VALLEJO.
(FROM A PHOTOGRAPH BY BRADLEY & RULOFSON, LENT
BY LOYALL FARRAGUT.)

motion to an Indian boy outside and he brought me a handful of beans and a handful of *manteca*, which is used by Mexicans instead of lard. It seemed as if they were going to starve me to death. After having been there three days I saw through the door a man whom, from his light hair, I took to be an American, although he was clad in the wild picturesque garb of a native Californian, including serape and the huge spurs used by the vaquero. I had the sentry at the door hail him. He proved to be an American, a resident of the Pueblo of San José, named Thomas Bowen, and he kindly went to Vallejo, who was right across the way in the big Mission building, and procured for me the passport. I think I have that passport now, signed by Vallejo and written in Spanish by Victor Prudon, secretary of Vallejo. Every one at the Mission pronounced Marsh's action an outrage; such a thing was never known before.

We had already heard that a man by the name of Sutter was starting a colony a hundred miles away to the north in the Sacramento Valley. No other civilized settlements had been attempted anywhere east of the Coast Range; before Sutter came the Indians had reigned supreme. As the best thing to be

done I now determined to go to Sutter's, afterward called "Sutter's Fort," or New Helvetia. Dr. Marsh said we could make the journey in two days, but it took us eight. Winter had come in earnest, and winter in California then, as now, meant rain. I had three companions. It was wet when we started, and much of the time we traveled through a pouring rain. Streams were out of their banks; gulches were swimming; plains were inundated; indeed, most of the country was overflowed. There were no roads, merely paths, trodden only by Indians and wild game. We were compelled to follow the paths, even when they were under

Moreover, our coming was not unexpected to him. It will be remembered that in the Sierra Nevada one of our men named Jimmy John became separated from the main party. It seems that he came on into California, and, diverging into the north, found his way down to Sutter's settlement perhaps a little before we reached Dr. Marsh's. Through this man Sutter heard that our company of thirty men were already somewhere in California. He immediately loaded two mules with provisions taken out of his private stores, and sent two men with them in search of us. But they did not find us, and returned, with the pro-

FORT ROSS.

water, for the moment our animals stepped to one side down they went into the mire. Most of the way was through the region now lying between Lathrop and Sacramento. We got out of provisions and were about three days without food. Game was plentiful, but hard to shoot in the rain. Besides, it was impossible to keep our old flint-lock guns dry, and especially the powder dry in the pans. On the eighth day we came to Sutter's settlement; the fort had not then been begun. Sutter received us with open arms and in a princely fashion, for he was a man of the most polite address and the most courteous manners, a man who could shine in any society.

visions, to Sutter's. Later, after a long search, the same two men, having been sent out again by Sutter, struck our trail and followed it to Marsh's.

John A. Sutter was born in Baden in 1803 of Swiss parents, and was proud of his connection with the only republic of consequence in Europe. He was a warm admirer of the United States, and some of his friends had persuaded him to come across the Atlantic. He first went to a friend in Indiana with whom he staid awhile, helping to clear land, but it was business that he was not accustomed to. So he made his way to St. Louis and invested what means he had in merchandise, and went out as a New Mexi-

GENERAL JOHN A. SUTTER.
(FROM A PHOTOGRAPH BY BRADLEY & RULOFSON.)

can trader to Santa Fé. Having been unsuccessful at Santa Fé, he returned to St. Louis, joined a party of trappers, went to the Rocky Mountains, and found his way down the Columbia River to Fort Vancouver. There he formed plans for trying to get down to the coast of California to establish a colony. He took a vessel that went to the Sandwich Islands, and there communicated his plans to people who assisted him. But as there was no vessel going direct from the Sandwich Islands to California, he had to take a Russian vessel by way of Sitka. He got such credit and help as he could in the Sandwich Islands and induced five or six natives to accompany him

to start the contemplated colony. He expected to send to Europe and the United States for his colonists. When he came to the coast of California, in 1840, he had an interview with the governor, Alvarado, and obtained permission to explore the country and find a place for his colony. He came to the bay of San Francisco, procured a small boat and explored the largest river he could find, and selected the site where the city of Sacramento now stands.

A short time before we arrived Sutter had bought out the Russian-American Fur Company at Fort Ross and Bodega on the Pacific. That company had a charter from Spain to take furs, but had no right to the land. The

SUTTER'S FORT. (REDRAWN FROM A PHOTOGRAPH OF AN OLD PRINT.)

charter had about expired. Against the protest of the California authorities they had extended their settlement southward some twenty miles farther than they had any right to, and had occupied the country to, and even beyond, the bay of Bodega. The time came when the taking of furs was no longer profitable; the Russians were ordered to vacate and return to Sitka. They wished to sell out all their personal property and whatever remaining right they had to the land. So Sutter bought them out — cattle and horses; a little vessel of about twenty-five tons burden, called a launch; and other property, including forty odd pieces of old rusty cannon and one or two small brass pieces, with a quantity of old French flint-lock muskets pronounced by Sutter to be of those lost by Bonaparte in 1812 in his disastrous retreat from Moscow. This ordinance Sutter conveyed up the Sacramento River on the launch to his colony. As soon as the native Californians heard that he had bought out the Russians and was beginning to fortify himself by taking up the cannon they began to fear him. They were doubtless jealous because Americans and other foreigners had already commenced to make the place their headquarters, and they foresaw that Sutter's fort would be for them, especially for Americans, what it naturally did become in fact, a place of protection and general rendezvous; and so they threatened to break it up. Sutter had not as yet actually received his grant; he had simply taken prelim-

inary steps and had obtained permission to settle and proceed to colonize. These threats were made before he had begun the fort, much less built it, and Sutter felt insecure. He had a good many Indians whom he had collected about him, and a few white men (perhaps fifteen or twenty) and some Sandwich Islanders. When he heard of the coming of our thirty men he inferred at once that we would soon reach him and be an additional protection. With this feeling of security, even before the arrival of our party Sutter was so indiscreet as to write a letter to the governor or to some one in authority, saying that he wanted to hear no more threats of dispossession, for he was now able not only to defend himself but to go and chastise them. That letter having been despatched to the city of Mexico, the authorities there sent a new governor in 1842 with about six hundred troops to subdue Sutter. But the new governor, Manuel Micheltorena, was an intelligent man. He knew the history of California and was aware that nearly all of his predecessors had been expelled by insurrections of the native Californians. Sutter sent a courier to meet the governor before his arrival at Los Angeles, with a letter in French, conveying his greetings to the governor, expressing a most cordial welcome, and submitting cheerfully and entirely to his authority. In this way the governor and Sutter became fast friends, and through Sutter the Americans had a friend in Governor Micheltorena.

The first employment I had in California was in Sutter's service, about two months after our arrival at Marsh's. He engaged me to go to Bodega and Fort Ross and to stay there until he could finish removing the property which he had bought from the Russians. I remained there fourteen months, until everything was removed; then I came up into Sacramento Valley and took charge for Sutter of his Hock farm (so named from a large Indian village on the place), remaining there a little more than a year—in 1843 and part of 1844.

Nearly everybody who came to California made it a point to reach Sutter's Fort.¹ Sutter was one of the most liberal and hospitable of men. Everybody was welcome—one man or a hundred, it was all the same. He had peculiar traits: his necessities compelled him to take all he could buy, and he paid all he could pay; but he failed to keep up with his payments. And so he soon found himself immensely—almost hopelessly—involved in debt. His debt to the Russians amounted at first to something near one hundred thousand dollars. Interest increased apace. He had agreed to pay in wheat, but his crops failed. He struggled in every way, sowing large areas to wheat, increasing his cattle and horses, and trying to build a flouring mill. He kept his launch running to and from the bay, carrying down hides, tallow, furs, wheat, etc., returning with lumber brought by hand in the redwood groves nearest the bay and other supplies. On an average

it took a month to make a trip. The fare for each person was five dollars, including board. Sutter started many other new enterprises in order to find relief from his embarrassments; but, in spite of all he could do, these increased. Every year found him worse and worse off; but it was partly his own fault. He employed men—not because he always needed and could profitably employ them, but because in the kindness of his heart it simply became a habit to employ everybody who wanted employment. As long as he had anything he trusted any one with everything he wanted—responsible or otherwise, acquaintances and strangers alike. Most of the labor was done by Indians, chiefly wild ones, except a few from the Missions who spoke Spanish. The wild ones learned Spanish so far as they learned

SUTTER'S FORT AS IT IS NOW.
(REDRAWN FROM A PHOTOGRAPH BY H. S. BEALS.)

¹ Every year after the arrival of our party, in 1841, immigrant parties came across the plains to California; except in 1842, when they went to Oregon, most of them coming thence to California in 1843. Ours of 1841 being the first, let me add that a later party arrived in California in 1841. It was composed of about twenty-five persons who arrived at Westport, Mo., too late to come with us, and so went with the annual caravan of St. Louis traders to Santa Fé, and thence *via* the Gila River into Southern California.

Among the more noted arrivals on this coast I may mention:

1841.—Commodore Wilkes's Exploring Expedition, a party of which came overland from Oregon to California, under Captain Ringgold, I think.

1842.—Commodore Thomas ap Catesby Jones, who raised the American flag in Monterey.

1843.—First. L. W. Hastings, *via* Oregon. He was ambitious to make California a republic and to be its first president, and wrote an iridescent book to

anything, that being the language of the country, and everybody had to learn some-

induce immigration,—which came in 1846,—but found the American flag flying when he returned with the immigration he had gone to meet. Also among the noted arrivals in 1843 was Pierson B. Reading, an accomplished gentleman, the proprietor of Reading's ranch in Shasta County, and from whom Fort Reading took its name. Samuel J. Hensley was also one of the same party. Second. Dr. Sandels, a very intelligent man.

1844.—First. Frémont's first arrival (in March); Mr. Charles Preuss, a scientific man, and Kit Carson with him. Second. The Stevens-Townsend-Murphy party, who brought the first wagons into California across the plains.

1845.—First. James W. Marshall, who, in 1848, discovered the gold. Second. Frémont's second arrival, also Hastings's second arrival.

1846.—Largest immigration party, the one Hastings went to meet. The Donner party was among the last of these immigrants.

thing of it. The number of men employed by Sutter may be stated at from 100 to 500 — the latter number at harvest time. Among them were blacksmiths, carpenters, tanners, gunsmiths, vaqueros, farmers, gardeners, weavers (to weave coarse woolen blankets), hunters,

corral; then three or four hundred wild horses were turned in to thresh it, the Indians whooping to make them run faster. Suddenly they would dash in before the band at full speed, when the motion became reversed, with the effect of plowing up the trampled straw to the

A CALIFORNIA CART.

sawyers (to saw lumber by hand, a custom known in England), sheep-herders, trappers, and, later, millwrights and a distiller. In a word, Sutter started every business and enterprise possible. He tried to maintain a sort of military discipline. Cannon were mounted, and pointed in every direction through embrasures in the walls and bastions. The soldiers were Indians, and every evening after coming from work they were drilled under a white officer, generally a German, marching to the music of fife and drum. A sentry was always at the gate, and regular bells called men to and from work.

Harvesting, with the rude implements, was a scene. Imagine three or four hundred wild Indians in a grain field, armed, some with sickles, some with butcher-knives, some with pieces of hoop iron roughly fashioned into shapes like sickles, but many having only their hands with which to gather by small handfuls the dry and brittle grain; and as their hands would soon become sore, they resorted to dry willow sticks, which were split to afford a sharper edge with which to sever the straw. But the wildest part was the threshing. The harvest of weeks, sometimes of a month, was piled up in the straw in the form of a huge mound in the middle of a high, strong, round

very bottom. In an hour the grain would be thoroughly threshed and the dry straw broken almost into chaff. In this manner I have seen two thousand bushels of wheat threshed in a single hour. Next came the winnowing, which would often take another month. It could only be done when the wind was blowing, by throwing high into the air shovelfuls of grain, straw, and chaff, the lighter materials being wafted to one side, while the grain, comparatively clean, would descend and form a heap by itself. In this manner all the grain in California was cleaned. At that day no such thing as a fanning mill had ever been brought to this coast.

The kindness and hospitality of the native Californians have not been overstated. Up to the time the Mexican régime ceased in California they had a custom of never charging for anything; that is to say, for entertainment — food, use of horses, etc. You were supposed, even if invited to visit a friend, to bring your blankets with you, and one would be very thoughtless if he traveled and did not take a knife with him to cut his meat. When you had eaten, the invariable custom was to rise, deliver to the woman or hostess the plate on which you had eaten the meat and beans — for that was about all they had — and say,

country, it prevailed in the towns too. There was not a hotel in San Francisco, or Monterey, or anywhere in California, till 1846, when the Americans took the country. The priests at the Missions were glad to entertain strangers without charge. They would give you a room in which to sleep, and perhaps a bedstead with a hide stretched across it, and over that you would spread your blankets.

At this time there was not in California any vehicle except a rude California cart; the wheels were without tires, and were made by felling an oak tree and hewing it down till it made a solid wheel nearly a foot thick on the rim and a little larger where the axle went through. The hole for the axle would be eight or nine inches in diameter, but a few years' use would increase it to a foot. To make the hole, an auger, gouge, or chisel was sometimes used, but the principal tool was an ax. A small tree required but little hew-

"Muchas gracias, Señora" ("Many thanks, madame"); and the hostess as invariably replied, *"Buen provecho"* ("May it do you much good"). The Missions in California invariably had gardens with grapes, olives, figs, pomegranates, pears, and apples, but the ranches scarcely ever had any fruit.¹ When you wanted a horse to ride, you would take it to the next ranch — it might be twenty, thirty, or fifty miles — and turn it out there, and sometime or other in reclaiming his stock the owner would get it back. In this way you might travel from one end of California to the other.

The ranch life was not confined to the

¹ With the exception of the tuna, or prickly pear, these were the only cultivated fruits I can recall to mind in California, except oranges, lemons, and limes, in a few places.

ing and shaping to answer for an axle. These carts were always drawn by oxen, the yoke being lashed with rawhide to the horns. To lubricate the axles they used soap (that is one thing the Mexicans could make), carrying along for the purpose a big pail of thick soapsuds which was constantly put in the box or hole; but you could generally tell when a California cart was coming half a mile away by the squeaking. I have seen the families of the wealthiest people go long distances at the rate of thirty miles or more a day, visiting in one of these clumsy two-wheeled vehicles. They had a little framework around it made of round sticks, and a bullock hide was put in for a floor or bottom. Sometimes the better class would have a little calico for curtains and cover. There was no such thing as a spoked wheel in use then. Somebody sent from Boston a wagon

ENGRAVED BY T. SCHUSLER.

THE GOVERNOR'S EQUIPAGE.

DRAWN BY FREDERIC REMINGTON.

as a present to the priest in charge of the Mission of San José, but as soon as summer came the woodwork shrunk, the tires came off, and it all fell to pieces. There was no one in California to set tires. When Governor Micheltorena was sent from Mexico to California

across the plains with the express purpose of finding gold. When he got into the Rocky Mountains, as I was told by his friend Dr. Townsend, Stevens said, "We are in a gold country." One evening (when they camped for the night) he went into a gulch, took some

HUNTING A RUNAWAY SAILOR.

he brought with him an ambulance, not much better than a common spring wagon, such as a marketman would now use with one horse. It had shafts, but in California at that time there was no horse broken to work in them, nor was there such a thing known as a harness; so the governor had two mounted vaqueros to pull it, their reatas being fastened to the shafts and to the pommels of their saddles. The first wagons brought into California came across the plains in 1844 with the Townsend or Stevens party. They were left in the mountains and lay buried under the snow till the following spring, when Moses Schallenger, Elisha Stevens (who was the captain of the party), and others went up and brought some of the wagons down into the Sacramento Valley. No other wagons had ever before reached California across the plains.¹

Elisha Stevens was from Georgia and had there worked in the gold mines. He started

gravel and washed it and got the color of gold, thus unmistakably showing, as he afterwards did in Lower California, that he had considerable knowledge of gold mining. But the strange thing is, that afterwards, when he passed up and down several times over the country between Bear and Yuba rivers, as he did with the party in the spring of 1845 to bring down their wagons, he should have seen no signs of gold where subsequently the whole country was found to contain it.

The early foreign residents of California were largely runaway sailors. Many if not most would change their names. For instance, Gilroy's ranch, where the town of Gilroy is now located, was owned by an old resident under the assumed appellation of Gilroy. Of course vessels touching upon this coast were liable, as they were everywhere, to lose men by desertion, especially if the men were maltreated. Such things have been so common that it is

¹ Mr. Schallenger still lives at San José. He remained a considerable part of the winter alone with the wagons, which were buried under the snow. When the last two men made a desperate effort to escape over the mountains into California, Schallenger tried to go with them, but was unable to bear the

fatigue, and so returned about fifteen miles to the cabin they had left near Donner Lake (as it was afterward called), where he remained, threatened with starvation, till one of the party returned from the Sacramento Valley and rescued him.

not difficult to believe that those who left their vessels in early days on this then distant coast had cause for so doing. To be known as a runaway sailor was no stain upon a man's character. It was no uncommon thing, after

my arrival here, for sailors to be skulking and hiding about from ranch to ranch till the vessel they had left should leave the coast. At Amador's ranch, before mentioned, on my first arrival here, I met a sailor boy, named Harrison Pierce, of eighteen or twenty years, who was concealing himself till his vessel should go to sea. He managed to escape recapture and so remained in the country. He was one of the men who went with me from Marsh's ranch to Sutter's. Californians would catch and return sailors to get the reward which, I believe, captains of vessels invariably offered. After the vessels had sailed and there was no chance of the reward the native Californians gave the fugitives no further trouble.

At that time the only trade, foreign or domestic, was in hides, tallow, and furs; but mostly hides. With few exceptions the vessels that visited the coast were from Boston, fitted out by Hooper to go there and trade for hides.¹ Occasionally vessels would put in for water or in distress. San Francisco was the principal harbor; the next was Monterey. There was an anchorage off San Luis Obispo; the next was Santa Barbara, the next San Buenaventura, then San Pedro, and lastly San Diego. (See map.) The hides were generally collected and brought to San Diego and there salted, staked out to dry, and folded so that they would

lie compactly in the ship, and thence were shipped to Boston. Goods were principally sold on board the vessels: there were very few stores on land; that of Thomas O. Larkin at Monterey was the principal one. The entrance of a vessel into harbor or roadstead was a signal to all the ranchers to come in their little boats and launches laden with hides to trade for goods. Thus vessels went from port to port, remaining few or many days according to the amount of trade. When the people stopped bringing hides, a vessel would leave.²

TWO PIKE COUNTY ARRIVALS.

¹ See Dana's "Two Years before the Mast" for a description of the California coast at this period.

² My first visit to the bay of San Francisco was in the first week of January, 1842. I had never before seen salt water. The town was called Yerba Buena, for the peppermint which was plentiful around some springs, located probably a little south of the junction of Pine and Sansome streets. Afterward—in 1847—when through the immigration of 1846 across the plains, and through arrivals around Cape Horn, the place had become a village of some importance, the citizens changed the name to San Francisco, the name

of the bay on which it is situated. With the exception of the Presidio and the Aduana (custom-house), all the buildings could be counted on the fingers and thumbs of one's hands. The most pretentious was a frame building erected by Jacob P. Leese, but then owned and occupied by the Hudson Bay Company, of which a Mr. Ray was agent. The others belonged to Captain Hinkley, Nathan Spear, Captain John J. Vioget, a Mr. Fuller, "Davis the carpenter," and a few others.

Monterey, when I first saw it (in 1844), had possibly 200 people, besides the troops, who numbered

I have said that there was no regular physician in California. Later, in 1843, in a company that came from Oregon, was one Joe Meeks, a noted character in the Rocky Mountains. On the way he said, "Boys, when I

binding it in a poultice of mud, and it grew on again. The new governor, Micheltorena, employed him as surgeon. Meeks had a way of looking and acting very wise, and of being reticent when people talked about things which

THE FIRST CALIFORNIA JAIL, MONTEREY.

get down to California among the Greasers I am going to palm myself off as a doctor"; and from that time they dubbed him Dr. Meeks. He could neither read nor write. As soon as the Californians heard of his arrival at Monterey they began to come to him with their different ailments. His first professional service was to a boy who had a toe cut off. Meeks, happening to be near, stuck the toe on,

he did not understand. One day he went into a little shop kept by a man known as Dr. Stokes, who had been a kind of hospital steward on board ship, and who had brought ashore one of those little medicine chests that were usually taken to sea, with apothecary scales, and a pamphlet giving a short synopsis of diseases and a table of weights and medicines, so that almost anybody could administer relief to

about 500. The principal foreigners living there then were: Thomas O. Larkin, David Spence, W. E. P. Hartnell, James Watson, Charles Walter, A. G. Toomes, R. H. Thomas, Talbot H. Green (Paul Geddes), W. Dickey, James McKinley, Milton Little, and Dr. James Stokes. The principal natives or Mexicans were Governor Micheltorena, Manuel Jimeno, José Castro, Juan Malarine, Francisco Arce, Don José Abrego. Larkin received his commission as American consul for California, at Mazatlan, in 1844. On his return to Monterey the woman who washed his clothes took the small-pox. Larkin's whole family had it; it spread, and the number of deaths was fearful, amounting to over eighty.

When I first saw Santa Barbara, February 5, 1845, the old Mission buildings were the principal ones. The town—probably half a mile to the east—contained possibly one hundred persons, among whom I recall Captain Wilson, Dr. Nicholas Den, Captain Scott, Mr. Sparks, Nibever; and of natives, Pablo De la Guerra, Carlos Antonio, Carillo, and others.

Los Angeles I first saw in March, 1845. It then had probably two hundred and fifty people, of whom I recall Don Abel Stearns, John Temple, Captain Alexander Bell, William Wolfskill, Lemuel Carpenter, David W. Alexander; also of Mexicans, Pio Pico (governor), Don Juan Bandini, and others. On ranches in the vicinity lived William Workman, B. D. Wilson, and John Roland. At San Pedro, Captain Johnson. At Rancho Chino, Isaac Williams. At San Juan Capistrano, Don Juan Foster.

I went to San Diego, July, 1846, with Frémont's battalion, on the sloop of war *Cyane*, Captain Dupont (afterwards Admiral). The population was about one hundred, among whom I recall Captain Henry D. Fitch, Don Miguel de Pedrera, Don Santiago Arguello, the Bandini family, J. M. Estudillo, and others. Subsequently, after the revolt of September, 1846, San Diego was the point from which, in January, 1847, the final conquest of California was made.

sick sailors. Meeks went to him and said, "Doctor, I want you to put me up some powders." So Stokes went behind his table and got out his scales and medicines, and asked, "What kind of powders?" "Just common powders—patient not very sick." "If you will tell me what kind of powders, Dr. Meeks—" "Oh, just common powders." That is all he would say. Dr. Stokes told about town that Meeks knew nothing about medicine, but people thought that perhaps Meeks had given the prescription in Latin and that Dr. Stokes could not read it. But Meeks's reign was to have an end. An American man-of-war came into the harbor. Thomas O. Larkin was then the United States consul at Monterey, and the commander and all his officers went up to Larkin's store, among them the surgeon, who was introduced to Dr. Meeks. The conversation turning upon the diseases incident to the country, Meeks became reticent, saying merely that he was going out of practice and intended to leave the country, because he could not get medicines. The surgeon expressed much sympathy and said, "Dr. Meeks, if you will make me out a list I will very cheerfully divide with you such medicines as I can spare." Meeks did not know the names of three kinds of medicine, and tried evasion, but the surgeon cornered him and put the question so direct that he had to answer. He asked him what medicine he needed most. Finally Meeks said he wanted some "draps," and that was all that could be got out of him. When the story came out his career as a doctor was at an end, and he soon after left the country.

In 1841 there was likewise no lawyer in California. In 1843 a lawyer named Hastings arrived *via* Oregon. He was an ambitious man, and desired to wrest the country from Mexico and make it a republic. He disclosed his plan to a man who revealed it to me. His scheme was to go down to Mexico and make friends of the Mexican authorities, if possible get a grant of land, and then go into Texas, consult President Houston, and go East and write a book, praising the country to the skies, which he did, with little regard to accuracy. His object was to start a large immigration, and in this he succeeded. The book was published in 1845, and undoubtedly largely induced what was called the "great immigration" of 1846 across the plains, consisting of about six hundred. Hastings returned to California in the autumn of 1845, preparatory to taking steps to declare the country independent and to establish a republic and make

himself president. In 1846 he went back to meet the immigration and to perfect his plans so that the emigrants would know exactly where to go and what to do. But in 1846 the Mexican war intervened, and while Hastings was gone to meet the immigration California was taken possession of by the United States. These doubtless were the first plans ever conceived for the independence of California. Hastings knew there were not enough Americans and foreigners yet in California to do anything. He labored hard to get money to publish his book, and went about lecturing on temperance in Ohio, where he became intimate with a fellow by the name of McDonald, who was acting the Methodist preacher and pretending, with considerable success, to raise funds for missionary purposes. At last they separated, McDonald preceding Hastings to San Francisco, where he became bartender for a man named Vioget, who owned a saloon and a billiard table—the first, I think, on the Pacific coast. Hastings returned later, and, reaching San Francisco in a cold rain, went up to Vioget's and called for brandy. He poured out a glassful and was about to drink it, when McDonald, recognizing him, leaned over the bar, extended his hand, and said, "My good temperance friend, how are you?" Hastings in great surprise looked him in the eyes, recognized him, and said, "My dear Methodist brother, how do you do?"

It is not generally known that in 1841—the year I reached California—gold was discovered in what is now a part of Los Angeles County. The yield was not rich; indeed, it was so small that it made no stir. The discoverer was an old Canadian Frenchman by the name of Baptiste Ruelle, who had been a trapper with the Hudson Bay Company, and, as was not an infrequent case with those trappers, had drifted down into New Mexico, where he had worked in placer mines. The mines discovered by Ruelle in California attracted a few New Mexicans, by whom they were worked for several years. But as they proved too poor, Ruelle himself came up into the Sacramento Valley, five hundred miles away, and engaged to work for Sutter when I was in Sutter's service.¹ Now it so happened that almost every year a party of a dozen men or more would come from or return to Oregon. Of such parties some—perhaps most of them—would be Canadian French, who had trapped all over the country, and these were generally the guides. In 1843 it was known to every one that such a party was getting ready to go to Oregon.

¹ New Mexican miners invariably carried their gold (which was generally small, and small in quantity as well) in a large quill—that of a vulture or turkey buzzard. Sometimes these quills would hold three or

four ounces, and, being translucent, they were graduated so as to see at any time the quantity in them. The gold was kept in by a stopper. Ruelle had such a quill, which appeared to have been carried for years.

CAÑON OF THE AMERICAN RIVER.

Baptiste Ruelle had been in Sutter's employ several months, when one day he came to Sutter, showed him a few small particles of gold, and said he had found them on the American River, and he wanted to go far into the mountains on that stream to prospect for gold. For this purpose he desired two mules loaded with provisions, and he selected two notably stupid Indian boys whom he wanted to go into the mountains with him, saying he would have no others. Of course he did not get the outfit. Sutter and I talked about it and queried, What does he want with so much provision — the American River being only a mile and the mountains only twenty miles distant? And why does he want those two stupid boys, since he might be attacked by the Indians? Our conclusion was that he really wanted the outfit so that he could join the party and go to Oregon and remain. Such I believe was Ruelle's intention; though in 1848, after James W. Marshall had discovered the gold at Coloma, Ruelle, who was one of the first to go there and mine, still protested that he had discovered gold on the American River in 1843. The only thing that I can recall to lend the least plausibility to Ruelle's pretensions would be that, so far as I know, he never, after that one time, manifested any desire to go to Oregon, and remained in California till he died. But I should add, neither did he ever show any longing again to go into the mountains to look for gold during the subsequent years he remained with Sutter, even to the time of Marshall's discovery.

Early in the spring of 1844, a Mexican working under me at the Hock Farm for

ON THE SUMMIT OF THE SIERRA.

Sutter came to me and told me there was gold in the Sierra Nevada. His name was Pablo Gutierrez. The discovery by Marshall, it will be remembered, was in January, 1848. Pablo told me this at a time when I was calling him to account because he had absented himself the day before without permission. I was giving him a lecture in Spanish, which I could speak quite well in those days. Like many Mexicans, he had an Indian wife; some time before, he had been in the mountains and had bought a squaw. She had run away from

him, and he had gone to find and bring her back. And it was while he was on this trip, he said, that he had seen signs of gold. After my lecture he said, "Señor, I have made an important discovery; there surely is gold on Bear River in the mountains." This was in March, 1844. A few days afterward I arranged to go with him up on Bear River. We went five or six miles into the mountains, when he showed me the signs and the place where he thought the gold was. "Well," I said, "can you not find some?" No, he said, because he must have a *batea*.

faithfully kept his promise. It would have taken us a year or two to get money enough to go. In those days there were every year four or five arrivals, sometimes six, of vessels laden with goods from Boston to trade for hides in California. These vessels brought around all classes of goods needed by the Mexican people. It would have required about six months each way, five months being a quick passage. But, as will be seen, our plans were interrupted. In the autumn of that year, 1844, a revolt took place. The native chiefs of Cali-

THE ANCHORAGE OF MONTEREY FROM THE OLD BURIAL-GROUND.

He talked so much about the "batea" that I concluded it must be a complicated machine. "Can't Mr. Keiser, our saddle-tree maker, make the batea?" I asked. "Oh, no." I did not then know that a batea is nothing more nor less than a wooden bowl which the Mexicans use for washing gold. I said, "Pablo, where can you get it?" He said, "Down in Mexico." I said, "I will help pay your expenses if you will go down and get one," which he promised to do. I said, "Pablo, say nothing to anybody else about this gold discovery, and we will get the batea and find the gold." As time passed I was afraid to let him go to Mexico, lest when he got among his relatives he might be induced to stay and not come back, so I made a suggestion to him. I said, "Pablo, let us save our earnings and get on a vessel and go around to Boston, and there get the batea; I can interpret for you, and the Yankees are very ingenious and can make anything." The idea pleased him, and he promised to go as soon as we could save enough to pay our expenses. He was to keep it a secret, and I believe he

fornia, José Castro and ex-Governor Alvarado, succeeded in raising an insurrection against the Mexican governor, Micheltorena, to expel him from the country. They accused him of being friendly to Americans and of giving them too much land. The truth was, he had simply shown impartiality. When Americans had been here long enough, had conducted themselves properly, and had complied with the colonization laws of Mexico, he had given them lands as readily as to native-born citizens. He was a fair-minded man and an intelligent and good governor, and wished to develop the country. His friendship for Americans was a mere pretext; for his predecessor, Alvarado, and his successor, Pío Pico, also granted lands freely to foreigners, and among them to Americans. The real cause of the insurrection against Micheltorena, however, was that the native chiefs had become hungry to get hold again of the revenues. The feeling against Americans was easily aroused and became their main excuse. The English and French influence, so far as felt, evidently leaned towards the side

of the Californians. It was not open but it was felt, and not a few expressed the hope that England or France would some day seize and hold California. I believe the Gachupines — natives of Spain, of whom there were a few — did not participate in the feeling against the Americans, though few did much, if anything, to allay it. In October Sutter went from Sacramento to Monterey, the capital, to see the governor. I went with him. On our way thither, at San José, we heard the first mutterings of the insurrection. We hastened to Monterey, and were the first to communicate the fact to the governor. Sutter, alarmed, took the first opportunity to get away by water. There were in those days no mail routes, no public conveyances of any kind, no regular line of travel, no public highways. But a vessel happened to touch at Monterey, and Sutter took passage to the bay of San Francisco, and thence by his own launch reached home. In a few days the first blow was struck, the insurgents taking all the horses belonging to the government at Monterey, setting the governor and all his troops on foot. He raised a few horse as best he could and pursued them, but could not overtake them on foot. However, I understood that a sort of parley took place at or near San José, but no battle, surrender, or settlement. Meanwhile, having started to return by land to Sutter's Fort, two hundred miles distant, I met the governor returning to Monterey. He stopped his forces and talked with me half an hour and confided to me his plans. He desired me to beg the Americans to be loyal to Mexico; to assure them that he was their friend, and in due time would give them all the lands to which they were entitled. He sent particularly friendly word to Sutter. Then I went on to the Mission of San José and there fell in with the insurgents, who had made that place their headquarters; I staid all night, and the leaders, Castro and Alvarado, treated me like a prince. The two insurgents protested their friendship for the Americans, and sent a request to Sutter to support them. On my arrival at the fort the situation was fully considered, and all, with a single exception, concluded to support Micheltorena. He had been our friend; he had granted us land; he promised, and we felt that we could rely upon, his continued friendship; and we felt, indeed we knew, we could not repose the same confidence in the native Californians. This man Pablo Gutierrez, who had told me about the gold in the Sierra Nevada, was a native of

Sinaloa in Mexico, and sympathized with the Mexican governor and with us. Sutter sent him with despatches to the governor, stating that we were organizing and preparing to join him. Pablo returned, and was sent again to tell the governor that we were on the march to join him at Monterey. This time he was taken prisoner with our despatches and was hanged to a tree, somewhere near the present town of Gilroy. That of course put an end to our gold discovery; otherwise Pablo Gutierrez might have been the discoverer instead of Marshall.¹

But I still had it in my mind to try to find gold; so early in the spring of 1845 I made it a point to visit the mines in the south discovered by Ruelle in 1841. They were in the mountains about twenty miles north or northeast of the Mission of San Fernando, or say fifty miles from Los Angeles. I wanted to see the Mexicans working there, and to gain what knowledge I could of gold digging. Dr. John Townsend went with me. Pablo's confidence that there was gold on Bear River was fresh in my mind; and I hoped the same year to find time to return there and explore, and if possible find gold in the Sierra Nevada. But I had no time that busy year to carry out my purpose. The Mexicans' slow and inefficient manner of working the mine was most discouraging. When I returned to Sutter's Fort the same spring Sutter desired me to engage with him for a year as bookkeeper, which meant his general business man as well. His financial matters being in a bad way, I consented. I had a great deal to do besides keeping the books. Among other undertakings we sent men southeast in the Sierra Nevada about forty miles from the fort to saw lumber with a whipsaw. Two men would saw of good timber about one hundred or one hundred and twenty-five feet a day. Early in July I framed an excuse to go into the mountains to give the men some special directions about lumber needed at the fort. The day was one of the hottest I had ever experienced. No place looked favorable for a gold discovery. I even attempted to descend into a deep gorge through which meandered a small stream, but gave it up on account of the brush and the heat. My search was fruitless. The place where Marshall discovered gold in 1848 was about forty miles to the north of the saw-pits at this place. The next spring, 1849, I joined a party to go to the mines on and south of the Cosumne and

¹ The insurrection ended in the capitulation—I might call it expulsion—of Micheltorena. The causes which led to this result were various, some of them infamous. Pio Pico, being the oldest member of the Departmental Assembly, became governor, and Castro

commander-in-chief of the military. They reigned but one year, and then came the Mexican war. Castro was made governor of Lower California, and died there. Pio Pico was not a vindictive man; he was a mild governor, and still lives at Los Angeles.

THE OLD CUARTEL AT MONTEREY.

Mokelumne rivers. The first day we reached a trading post—Digg's, I think, was the name. Several traders had there pitched their tents to sell goods. One of them was Tom Fallon, whom I knew. This post was within a few miles of where Sutter's men sawed the lumber in 1845. I asked Fallon if he had ever seen the old saw-pits where Sicard and Dupas had worked in 1845. He said he had, and knew the place well. Then I told him how I had attempted that year to descend into the deep gorge to the south of it to look for gold.

"My stars!" he said. "Why, that gulch down there was one of the richest placers that have ever been found in this country"; and he told me of men who had taken out a pint cupful of nuggets before breakfast.

Frémont's first visit to California was in the month of March, 1844. He came *via* eastern Oregon, traveling south and passing east of the Sierra Nevada, and crossed the chain about opposite the bay of San Francisco, at the head of the American River, and descended into the Sacramento Valley to Sutter's Fort. It was there I first met him. He staid but a short time, three or four weeks perhaps, to refit with fresh mules and horses and such provisions as he could obtain, and then set out on his return to the United States. Coloma, where Marshall afterward discovered gold, was on one of the branches of the American River. Frémont probably came down that very stream. How strange that he and his scientific corps did not discover signs of gold, as Commodore Wilkes's party had done when coming overland from Oregon in 1841! One morning at the breakfast table at Sutter's, Frémont was urged to remain a while and go to the coast, and among other things which it

would be of interest for him to see was mentioned a very large redwood tree (*Sequoia sempervirens*) near Santa Cruz, or rather a cluster of trees, forming apparently a single trunk, which was said to be seventy-two feet in circumference. I then told Frémont of the big tree I had seen in the Sierra Nevada in October, 1841, which I afterwards verified to be one of the fallen big trees of the Calaveras Grove. I therefore believe myself to have been the first white man to see the mammoth trees of California. The Sequoias are found nowhere except in California. The redwood that I speak of is the *Sequoia sempervirens*, and is confined to the sea-coast and the west side of the Coast Range Mountains. The *Sequoia gigantea*, or mammoth tree, is found only on the western slope of the Sierra Nevada—nowhere farther north than latitude 38° 30'.

Sutter's Fort was an important point from the very beginning of the colony. The building of the fort and all subsequent immigrations added to its importance, for that was the first point of destination to those who came by way of Oregon or direct across the plains. The fort was begun in 1842 and finished in 1844. There was no town till after the gold discovery in 1848, when it became the bustling, buzzing center for merchants, traders, miners, etc., and every available room was in demand. In 1849 Sacramento City was laid off on the river two miles west of the fort, and the town grew up there at once into a city. The first town was laid off by Hastings and myself in the month of January, 1846, about three or four miles below the mouth of the American River, and called Sutterville. But first the Mexican war, then the lull which always follows excitement, and then the rush

and roar of the gold discovery, prevented its building up till it was too late. Attempts were several times made to revive Suttersville, but Sacramento City had become too strong to be removed. Sutter always called his colony and fort "New Helvetia," in spite of which the name mostly used by others, before the Mexican war, was Sutter's Fort, or Sacramento, and later Sacramento altogether.

Sutter's many enterprises continued to create a growing demand for lumber. Every year, and sometimes more than once, he sent parties into the mountains to explore for an available site to build a sawmill on the Sacramento River or some of its tributaries, by which the lumber could be rafted down to the fort. There was no want of timber or of water power in the mountains, but the cañon features of the streams rendered rafting impracticable. The year after the war (1847) Sutter's needs for lumber were even greater than ever, although his embarrassments had increased and his ability to undertake new enterprises became less and less. Yet, never discouraged, nothing daunted, another hunt must be made for a sawmill site. This time Marshall happened to be the man chosen by Sutter to search the mountains. He was gone about a month, and returned with a most favorable report.

James W. Marshall went across the plains to Oregon in 1844, and thence came to California the next year. He was a wheelwright by trade, but, being very ingenious, he could turn his hand to almost anything. So he acted as carpenter for Sutter, and did many other things, among which I may mention making wheels for spinning wool, and looms, reeds, and shuttles for weaving yarn into coarse blankets for the Indians, who did the carding, spinning, weaving, and all other labor. In 1846 Marshall went through the war to its close as a private. Besides his ingenuity as a mechanic, he had most singular traits. Almost everyone pronounced him half crazy or hare-brained. He was certainly eccentric, and perhaps somewhat flighty. His insanity, however, if he had any, was of a harmless kind; he was neither vicious nor quarrel-

some. He had great, almost overweening, confidence in his ability to do anything as a mechanic. I wrote the contract between Sutter and him to build the mill. Sutter was to furnish the means; Marshall was to build and run the mill, and have a share of the lumber for his compensation. His idea was to haul the lumber part way and raft it down the American River to Sacramento, and thence, his part of it, down the Sacramento River, and through Suisun and San Pablo bays to San Francisco for a market. Marshall's mind, in some respects at least, must have been unbalanced. It is hard to conceive how any sane man could have been so wide of the mark, or how any one could have selected such a site for a sawmill under the circumstances. Surely no other man than Marshall ever entertained so wild a scheme as that of rafting sawed lumber down the cañons of the American River, and no other man than Sutter would have been so confiding and credulous as to patronize him. It is proper to say that, under great difficulties, enhanced by winter rains, Marshall succeeded in building the mill — a very good one, too, of the kind. It had improvements which I had never seen in sawmills, and I had had considerable experience in Ohio. But the

A SPANISH-CALIFORNIAN TYPE.

mill would not run because the wheel was placed too low. It was an old-fashioned flutter wheel that propelled an upright saw. The gravelly bar below the mill backed the water up, and submerged and stopped the wheel. The remedy was to dig a channel or tail-race through the bar below to conduct away the water. The wild Indians of the mountains were employed to do the digging. Once through the bar there would be plenty of fall. The digging was hard and took some weeks. As soon as the water began to run through the tail-race the wheel was blocked, the gate raised, and the water permitted to gush through all night. It was Marshall's custom to examine the race while the water was running through in the morning, so as to direct the Indians where to deepen it, and then shut off the water for them to work during the day. The water was clear as crystal, and the current was swift enough to sweep away the sand and lighter materials. Marshall made these examinations early in the morning while the Indians were getting their breakfast. It was on one of these occasions, in the clear shallow water, that he saw something bright and yellow. He picked it up—it was a piece of gold! The world has seen and felt the result. The mill sawed little or no lum-

covery to San Francisco; how the same year I discovered gold on Feather River and worked it; how I made the first weights and scales to weigh the first gold for Sam Brannan; how the richness of the mines became known by the Mormons who were employed by Sutter to work at the sawmill, working about on Sundays and finding it in the crevices along the stream and taking it to Brannan's store at the fort, and how Brannan kept the gold a secret as long as he could till the excitement burst out all at once like wildfire.

Among the notable arrivals at Sutter's Fort should be mentioned that of Castro and Castillero, in the fall of 1845. The latter had been before in California, sent, as he had been this time, as a peace commissioner from Mexico. Castro was so jealous that it was almost impossible for Sutter to have anything like a private interview with him. Sutter, however, was given to understand that, as he had stood friendly to Governor Micheltorena on the side of Mexico in the late troubles, he might rely on the friendship of Mexico, to which he was enjoined to continue faithful in all emergencies. Within a week Castillero was shown at San José a singular heavy reddish rock, which had long been known to the Indians, who rubbed it on their hands and faces to paint them. The Californians had often tried to smelt this rock in a blacksmith's fire, thinking it to be silver or some other precious metal. But Castillero, who was an intelligent man and a native of Spain, at once recognized it as quicksilver, and noted its resemblance to the cinnabar in the mines of Almaden. A company was immediately formed to work it, of which Castillero, Castro, Alexander Forbes, and others were members. The discovery of quicksilver at this time seems providential in view of its absolute necessity to supplement the imminent discovery of gold, which stirred and waked into new life the industries of the world.

It is a question whether the United States could have stood the shock of the great rebellion of 1861 had the California gold discovery not been made. Bankers and business men of New York in 1864 did not hesitate to admit that but for the gold of California, which monthly poured its five or six millions into that financial center, the bottom would have dropped out of everything. These timely arrivals so strengthened the nerves of trade and stimulated business as to enable the Government to sell its bonds at a time when its credit was its life-

BULL AND BEAR FIGHT.

ber; as a lumber enterprise the project was a failure, but as a gold discovery it was a grand success.

There was no excitement at first, nor for three or four months—because the mine was not known to be rich, or to exist anywhere except at the sawmill, or to be available to any one except Sutter, to whom every one conceded that it belonged. Time does not permit me to relate how I carried the news of the dis-

blood and the main reliance by which to feed, clothe, and maintain its armies. Once our bonds went down to thirty-eight cents on the dollar. California gold averted a total collapse, and enabled a preserved Union to come forth from the great conflict with only four billions of debt instead of a hundred billions. The hand of Providence so plainly seen in the discovery

of gold is no less manifest in the time chosen for its accomplishment.

I must reserve for itself in a concluding paper my personal recollections of Frémont's second visit to California in 1845-46, which I have purposely wholly omitted here. It was most important, resulting as it did in the acquisition of that territory by the United States.

John Bidwell.

RANCH AND MISSION DAYS IN ALTA CALIFORNIA.

IT seems to me that there never was a more peaceful or happy people on the face of the earth than the Spanish, Mexican, and Indian population of Alta California before the American conquest. We were the pioneers of the Pacific coast, building towns and Missions while General Washington was carrying on the war of the Revolution, and we often talk together of the days when a few hundred large Spanish ranches and Mission tracts occupied the whole country from the Pacific to the San Joaquin. No class of American citizens is more loyal than the Spanish Californians, but we shall always be especially proud of the traditions and memories of the long pastoral age before 1840. Indeed, our social life still tends to keep alive a spirit of love for the simple, homely, outdoor life of our Spanish ancestors on this coast, and we try, as best we may, to honor the founders of our ancient families, and the saints and heroes of our history since the days when Father Junipero planted the cross at Monterey.

The leading features of old Spanish life at the Missions, and on the large ranches of the last century, have been described in many books of travel, and with many contradictions. I shall confine myself to those details and illustrations of the past that no modern writer can possibly obtain except vaguely, from hearsay, since they exist in no manuscript, but only in the memories of a generation that is fast passing away. My mother has told me much, and I am still more indebted to my illustrious uncle, General Vallejo, of Sonoma, many of whose recollections are incorporated in this article.

When I was a child there were fewer than fifty Spanish families in the region about the bay of San Francisco, and these were closely connected by ties of blood or intermarriage. My father and his brother, the late General Vallejo, saw, and were a part of, the most important events in the history of Spanish Cali-

fornia, the revolution and the conquest. My grandfather, Don Ygnacio Vallejo, was equally prominent in his day, in the exploration and settlement of the province. The traditions and records of the family thus cover the entire period of the annals of early California, from San Diego to Sonoma.

What I wish to do is to tell, as plainly and carefully as possible, how the Spanish settlers lived, and what they did in the old days. The story will be partly about the Missions, and partly about the great ranches.

The Jesuit Missions established in Lower California, at Loreto and other places, were followed by Franciscan Missions in Alta California, with presidios for the soldiers, adjacent pueblos, or towns, and the granting of large tracts of land to settlers. By 1782 there were nine flourishing Missions in Alta California—San Francisco, Santa Clara, San Carlos, San Antonio, San Luis Obispo, San Buenaventura, San Gabriel, San Juan, and San Diego. Governor Fajés added Santa Barbara and Purísima, and by 1790 there were more than 7000 Indian converts in the various Missions. By 1800 about forty Franciscan fathers were at work in Alta California, six of whom had been among the pioneers of twenty and twenty-five years before, and they had established seven new Missions—San José, San Miguel, Soledad, San Fernando, Santa Cruz, San Juan Bautista, and San Luis Rey. The statistics of all the Missions, so far as they have been preserved, have been printed in various histories, and the account of their growth, prosperity, and decadence has often been told. All that I wish to point out is that at the beginning of the century the whole system was completely established in Alta California. In 1773 Father Palou had reported that all the Missions, taken together, owned two hundred and four head of cattle and a few sheep, goats, and mules. In 1776 the regular five years' supplies sent from Mexico to the Missions were as follows: 107 blankets, 480 yards striped sackcloth, 389 yards blue baize, 10 pounds blue maguey cloth,

A SPANISH WINDOW.

4 reams paper, 5 bales red pepper, 10 arrobas of tasajo (dried beef), beads, chocolate, lard, lentils, rice, flour, and four barrels of Castilian wine. By 1800 all this was changed: the flocks and herds of cattle of California contained 187,000 animals, of which 153,000 were in the Mission pastures, and large areas of land had been brought under cultivation, so that the Missions supplied the presidios and foreign ships.

No one need suppose that the Spanish pioneers of California suffered many hardships or privations, although it was a new country. They came slowly, and were well prepared to become settlers. All that was necessary for the maintenance and enjoyment of life according to the simple and healthful standards of those days was brought with them. They had seeds, trees, vines, cattle, household goods, and servants, and in a few years their orchards yielded abundantly and their gardens were full of veg-

etables. Poultry was raised by the Indians, and sold very cheaply; a fat capon cost only twelve and a half cents. Beef and mutton were to be had for the killing, and wild game was very abundant. At many of the Missions there were large flocks of tame pigeons. At the Mission San José the fathers' doves consumed a cental of wheat daily, besides what they gathered in the village. The doves were of many colors, and they made a beautiful appearance on the red tiles of the church and the tops of the dark garden walls.

The houses of the Spanish people were built of adobe, and were roofed with red tiles. They were very comfortable, cool in summer and warm in winter. The clay used to make the bricks was dark brown, not white or yellow, as the adobes in the Rio Grande region and in parts of Mexico. Cut straw was mixed with the clay, and trodden together by the Indians. When the bricks were laid, they were set in clay as in mortar, and sometimes small pebbles from the brooks were mixed with the mortar to make bands across the house. All the timber of the floors, the rafters and crossbeams, the doorways, and the window lintels were "built in" as the house was carried up. After the house was roofed it was usually plastered inside and out to protect it against the weather and make it more comfortable. A great deal of trouble was often taken to obtain stone for the doorsteps, and curious rocks were sometimes brought many miles for this purpose, or for gate-posts in front of the dwelling.

The Indian houses were never more than one story high, also of adobe, but much smaller and with thinner walls. The inmates covered the earthen floors in part with coarse mats woven of tules, on which they slept. The Missions, as fast as possible, provided them with blankets, which were woven under the fathers' personal supervision, for home use and for sale. They were also taught to weave a coarse serge for clothing.

It was between 1792 and 1795, as I have heard, that the governor brought a number of artisans from Mexico, and every Mission wanted them, but there were not enough to go around. There were masons, millwrights, tanners, shoemakers, saddlers, potters, a ribbonmaker, and several weavers. The blankets and the coarse cloth I have spoken of were first woven in the southern Missions, San Gabriel, San Juan Capistrano, and others. About 1797 cotton cloth was also made in a few cases, and the cotton plant was found to grow very well. Hemp was woven at Monterey. Pottery was

made at Mission Dolores, San Francisco. Soap was made in 1798, and afterwards at all the Missions and on many large ranches. The settlers themselves were obliged to learn trades and teach them to their servants, so that an educated young gentleman was well skilled in many arts and handicrafts. He could ride, of course, as well as the best cow-boy of the Southwest, and with more grace; and he could throw the lasso so expertly that I never heard of any American who was able to equal it. He could also make soap, pottery, and bricks, burn lime, tan hides, cut out and put together a pair of shoes, make candles, roll cigars, and do a great number of things that belong to different trades.

The California Indians were full of rude superstitions of every sort when the Franciscan fathers first began to teach them. It is hard to collect old Indian stories in these days, because they have become mixed up with what the fathers taught them. But the wild Indians a hundred years ago told the priests what they believed, and it was difficult to persuade them to give it up. In fact, there was more or less of what the fathers told them was "devil-worship" going on all the time. Rude stone altars were secretly built by the Mission Indians to "Cooksuy," their dreaded god. They chose a lonely place in the hills, and made piles of flat stones, five or six feet high. After that each Indian passing would throw something there, and this act of homage, called "pooish," continued until the mound was covered with a curious collection of beads, feathers, shells from the coast, and even garments and food, which no Indian dared to touch. The fathers destroyed all such altars that they could discover, and punished the Indians who worshiped there. Sometimes the more ardent followers of Cooksuy had meetings at night, slipping away from the Indian village after the retiring-bell had rung and the alcalde's rounds had been made. They prepared for the ceremony by fasting for several days; then they went to the chosen place, built a large fire, went through many dances, and called the god by a series of very strange and wild whistles, which always frightened any person who heard them. The old Indians, after being converted, told the priests that before they had seen the Spaniards come Cooksuy made his appearance from the midst of the fire in the form of a large white serpent; afterward the story was changed, and they reported that he sometimes took the form of a bull with fiery eyes.

Indian alcaldes were appointed in the Mission towns to maintain order. Their duty was that of police officers; they were dressed better than the others, and wore shoes and stock-

ings, which newly appointed officers dispensed with as often as possible, choosing to go barefoot, or with stockings only. When a vacancy in the office occurred the Indians themselves were asked which one they preferred of several suggested by the priest. The Mission San José had about five thousand Indian converts at the time of its greatest prosperity, and a number of Indian alcaldes were needed there. The alcaldes of the Spanish people in the pueblos were more like local judges, and were appointed by the governor.

The Indians who were personal attendants of the fathers were chosen with much care, for their obedience and quickness of perception. Some of them seemed to have reached the very perfection of silent, careful, unselfish service. They could be trusted with the most important matters, and they were strictly honest. Each father had his own private barber, who enjoyed the honor of a seat at the table with him, and generally accompanied him in journeys to other Missions. When the Missions were secularized, this custom, like many others, was abolished, and one Indian barber, named Telequis, felt the change in his position so much that when he was ordered out to the field with the others he committed suicide by eating the root of a poisonous wild plant, a species of celery.

The Indian vaqueros, who lived much of the time on the more distant cattle ranges, were a wild set of men. I remember one of them, named Martin, who was stationed in Amador Valley and became a leader of the hill vaqueros, who were very different from the vaqueros of the large valley near the Missions. He and his friends killed and ate three or four hundred young heifers belonging to the Mission, but when Easter approached he felt that he must confess his sins, so he went to Father Narciso and told all about it. The father forgave him, but ordered him to come in from the hills to the Mission and attend school until he could read. The rules were very strict; whoever failed twice in a lesson was always whipped. Martin was utterly unable to learn his letters, and he was whipped every day for a month; but he never complained. He was then dismissed, and went back to the hills. I used to question Martin about the affair, and he would tell me with perfect gravity of manner, which was very delightful, how many calves he had consumed and how wisely the good father had punished him. He knew now, he used to say, how very hard it was to live in the town, and he would never steal again lest he might have to go to school until he had learned his letters.

It was the custom at all the Missions, during the rule of the Franciscan missionaries, to

keep the young unmarried Indians separate. The young girls and the young widows at the Mission San José occupied a large adobe building, with a yard behind it, inclosed by high adobe walls. In this yard some trees were planted, and a *zanja*, or water-ditch, supplied a large bathing-pond. The women were kept busy at various occupations, in the building, under the trees, or on the wide porch; they were taught spinning, knitting, the weaving of Indian baskets from grasses, willow rods and roots, and more especially plain sewing. The treatment and occupation of the unmarried women was similar at the other Missions. When heathen Indian women came in, or were brought by their friends, or by the soldiers, they were put in these houses, and under the charge of older women, who taught them what to do.

The women, thus separated from the men, could only be courted from without through the upper windows facing on the narrow village street. These windows were about two feet square, crossed by iron bars, and perhaps three feet deep, as the adobe walls were very thick. The rules were not more strict, however, than still prevail in some of the Spanish-American countries in much higher classes, socially, than these uneducated Indians belonged to; in fact, the rules were adopted by the fathers from Mexican models. After an Indian, in his hours of freedom from toil, had declared his affection by a sufficiently long attendance upon a certain window, it was the duty of the woman to tell the father missionary and to declare her decision. If this was favorable, the young man was asked if he was willing to contract marriage with the young woman who had confessed her preference. Sometimes there were several rival suitors, but it was never known that any trouble occurred. After marriage the couple were conducted to their home, a hut built for them among the other Indian houses in the village near the Mission.

The Indian mothers were frequently told about the proper care of children, and cleanliness of the person was strongly inculcated. In fact, the Mission Indians, large and small, were wonderfully clean, their faces and hair fairly shining with soap and water. In several cases where an Indian woman was so slovenly and neglectful of her infant that it died she was punished by being compelled to carry in her arms in church; and at all meals and public assemblies, a log of wood about the size of a nine-months'-old child. This was a very effectual punishment, for the Indian women are naturally most affectionate creatures, and in every case they soon began to suffer greatly, and others with them, so that once a whole

Indian village begged the father in charge to forgive the poor woman.

The padres always had a school for the Indian boys. My mother has a *novena*, or "nine-days' devotion book," copied for her by one of the Indian pupils of the school at the Mission San José, early in the century. The handwriting is very neat and plain, and would be a credit to any one. Many young Indians had good voices, and these were selected with great care to be trained in singing for the church choir. It was thought such an honor to sing in church that the Indian families were all very anxious to be represented. Some were taught to play on the violin and other stringed instruments. When Father Narciso Duran, who was the president of the Franciscans in California, was at the Mission San José, he had a church choir of about thirty well-trained boys to sing the mass. He was himself a cultivated musician, having studied under some of the best masters in Spain, and so sensitive was his ear that if one string was out of tune he could not continue his service, but would at once turn to the choir, call the name of the player, and the string that was out of order, and wait until the matter was corrected. As there were often more than a dozen players on instruments, this showed high musical ability. Every prominent Mission had fathers who paid great attention to training the Indians in music.

A Spanish lady of high social standing tells the following story, which will illustrate the honor in which the Mission fathers were held:

Father Majin Catala, one of the missionaries early in the century, was held to possess prophetic gifts, and many of the Spanish settlers, the Castros, Peraltas, Estudillos, and others, have reason to remember his gift. When any priest issued from the sacristy to celebrate mass all hearts were stirred, but with this holy father the feeling became one of absolute awe. On more than one occasion before his sermon he asked the congregation to join him in prayers for the soul of one about to die, naming the hour. In every case this was fulfilled to the very letter, and that in cases where the one who died could not have known of the father's words. This saint spent his days in labor among the people, and he was loved as well as feared. But on one occasion, in later life, when the Mission rule was broken, he offended an Indian chief, and shortly after several Indians called at his home in the night to ask him to go and see a dying woman. The father rose and dressed, but his chamber door remained fast, so that he could not open it, and he was on the point of ordering them to break it open from without, when he felt a warning, to the

effect that they were going to murder him. Then he said, "To-morrow I will visit your sick: you are forgiven; go in peace." Then they fled in dismay, knowing that his person was protected by an especial providence, and soon after confessed their plans to the father.

Father Real was one of the most genial and kindly men of the missionaries, and he surprised all those who had thought that every one of the fathers was severe. He saw no harm in walking out among the young people, and saying friendly things to them all. He was often known to go with young men on moonlight rides, lassoing grizzly bears, or chasing deer on the plain. His own horse, one of the best ever seen in the valley, was richly caparisoned, and the father wore a scarlet silk sash around his waist under the Franciscan habit. When older and graver priests reproached him, he used to say with a smile that he was only a Mexican Franciscan, and that he was brought up in a saddle. He was certainly a superb rider.

It is said of Father Amoros of San Rafael that his noon meal consisted of an ear of dry corn, roasted over the coals. This he carried in his sleeve and partook of at his leisure while overseeing the Indian laborers. Some persons who were in the habit of reaching a priest's house at noontime, so as to be asked to dinner, once called on the father, and were told that he had gone to the field with his corn in his *manguilla*, but they rode away without seeing him, which was considered a breach of good manners, and much fun was made over their haste.

The principal sources of revenue which the Missions enjoyed were the sales of hides and tallow, fresh beef, fruits, wheat, and other things to ships, and in occasional sales of horses to trappers or traders. The Russians at Fort Ross, north of San Francisco, on Bodega Bay, bought a good deal from the Missions. Then too the Indians were sent out to trade with other Indians, and so the Mission's often secured many valuable furs, such as otter and beaver, together with skins of bears and deer killed by their own hunters.

The *embarcadero*, or "landing," for the Mission San José was at the mouth of a salt-water creek four or five miles away. When a ship sailed into San Francisco Bay, and the captain sent a large boat up this creek and arranged to buy hides, they were usually hauled there on an ox-cart with solid wooden wheels, called a *carreta*. But often in winter, there being no roads across the valley, each separate hide was doubled across the middle and placed on the head of an Indian. Long files of Indians, each carrying a hide in this manner, could be seen trotting over the unfenced level land through the wild mustard to the *embarcadero*, and in

a few weeks the whole cargo would thus be delivered. For such work the Indians always received additional gifts for themselves and families.

A very important feature was the wheat harvest. Wheat was grown more or less at all the Missions. If those Americans who came to California in 1849 and said that wheat would not grow here had only visited the Missions they would have seen beautiful large wheatfields. Of course at first many mistakes were made by the fathers in their experiments, not only in wheat and corn, but also in wine-making, in crushing olives for oil, in grafting trees, and in creating fine flower and vegetable gardens. At most of the Missions it took them several years to find out how to grow good grain. At first they planted it on too wet land. At the Mission San José a tract about a mile square came to be used for wheat. It was fenced in with a ditch, dug by the Indians with sharp sticks and with their hands in the rainy season, and it was so deep and wide that cattle and horses never crossed it. In other places stone or adobe walls, or hedges of the prickly pear cactus, were used about the wheatfields. Timber was never considered available for fences, because there were no saw-mills and no roads to the forests, so that it was only at great expense and with extreme difficulty that we procured the logs that were necessary in building, and chopped them slowly, with poor tools, to the size we wanted. Sometimes low adobe walls were made high and safe by a row of the skulls of Spanish cattle, with the long curving horns attached. These came from the *matanzas*, or slaughter-corral, where there were thousands of them lying in piles, and they could be so used to make one of the strongest and most effective of barriers against man or beast. Set close and deep, at various angles, about the gateways and corral walls, these cattle horns helped to protect the inclosure from horse-thieves.

When wheat was sown it was merely "scratched in" with a wooden plow, but the ground was so new and rich that the yield was great. The old Mission field is now occupied by some of the best farms of the valley, showing how excellent was the fathers' judgment of good land. The old ditches which fenced it have been plowed in for more than forty years by American farmers, but their course can still be distinctly traced.

A special ceremony was connected with the close of the wheat harvest. The last four sheaves taken from this large field were tied to poles in the form of a cross, and were then brought by the reapers in the "harvest procession" to the church, while the bells were rung, and the father, dressed in his robes,

carrying the cross and accompanied by boys with tapers and censers, chanting the Te Deum as they marched, went forth to meet the sheaves. This was a season of Indian festival also, and one-fifth of the whole number of the Indians were sometimes allowed to leave the Mission for a certain number of days, to gather acorns, dig roots, hunt, fish, and enjoy a change of occupation. It was a privilege that they seldom, or never, abused by failing to return, and the fact shows how well they were treated in the Missions.

Governor Neve proposed sowing wheat, I have heard, in 1776, and none had been sown in California before that time. At the pueblo of San José, which was established in 1777, they planted wheat for the use of the presidios, and the first sowing was at the wrong season and failed, but the other half of their seed did better. The fathers at San Diego Mission sowed grain on the bottom lands in the willows the first year, and it was washed away; then they put it on the mesa above the Mission, and it died; the third year they found a good piece of land, and it yielded one hundred and ninety-five fold.

As soon as the Missions had wheatfields they wanted flour, and mortars were made. Some of them were holes cut in the rock, with a heavy pestle, lifted by a long pole. When La Pérouse, the French navigator, visited Monterey in 1786, he gave the fathers in San Carlos an iron hand-mill, so that the neophyte women could more easily grind their wheat. He also gave the fathers seed-potatoes from Chili, the first that were known in California. La Pérouse and his officers were received with much hospitality at San Carlos. The Indians were told that the Frenchmen were true Catholics, and Father Palou had them all assembled at the reception. Mrs. Ord, a daughter of the De la Guerra family, had a drawing of this occasion, made by an officer, but it was stolen about the time of the American conquest, like so many of the precious relics of Spanish California. La Pérouse wrote: "It is with the sweetest satisfaction that I shall make known the pious and wise conduct of these friars, who fulfil so perfectly the object of their institution. The greatest anchorites have never led a more edifying life."

Early in the century flour-mills by water were built at Santa Cruz, San Luis Obispo, San José, and San Gabriel. The ruins of some of these now remain; the one at Santa Cruz is very picturesque. Horse-power mills were in use at many places. About the time that the Americans began to arrive in numbers the Spanish people were just commencing to project larger mill enterprises and irrigation ditches for their own needs. The difficulties with land

titles put an end to most of these plans, and some of them were afterward carried out by Americans when the ranches were broken up.

One of the greatest of the early irrigation projects was that of my grandfather, Don Ygnacio Vallejo, who spent much labor and money in supplying San Luis Obispo Mission with water. This was begun in 1776, and completed the following year. He also planned to carry the water of the Carmel River to Monterey; this has since been done by the Southern Pacific Railway Company. My father, Don J. J. Vallejo, about fifty years ago made a stone aqueduct and several irrigation and mill ditches from the Alameda Creek, on which stream he built an adobe flour-mill, whose millstones were brought from Spain.

I have often been asked about the old Mission and ranch gardens. They were, I think, more extensive, and contained a greater variety of trees and plants, than most persons imagine. The Jesuits had gardens in Baja California as early as 1699, and vineyards and orchards a few years later. The Franciscans in Alta California began to cultivate the soil as soon as they landed. The first grapevines were brought from Lower California in 1769, and were soon planted at all the Missions except Dolores, where the climate was not suitable. Before the year 1800 the orchards at the Missions contained apples, pears, peaches, apricots, plums, cherries, figs, olives, oranges, pomegranates. At San Diego and San Buenaventura Missions there were also sugar canes, date palms, plantains, bananas, and citrons. There were orchards and vineyards in California sufficient to supply all the wants of the people. I remember that at the Mission San José we had many varieties of seedling fruits which have now been lost to cultivation. Of pears we had four sorts, one ripening in early summer, one in late summer, and two in autumn and winter. The Spanish names of these pears were the *Presidenta*, the *Bergamota*, the *Puna*, and the *Lechera*. One of them was as large as a Bartlett, but there are no trees of it left now. The apples, grown from seed, ripened at different seasons, and there were seedling peaches, both early and late. An interesting and popular fruit was that of the *Nopal*, or prickly pear. This fruit, called *tuna*, grew on the great hedges which protected part of the Mission orchards and were twenty feet high and ten or twelve feet thick. Those who know how to eat a *tuna*, peeling it so as to escape the tiny thorns on the skin, find it delicious. The Missions had avenues of fig, olive, and other trees about the buildings, besides the orchards. In later times American squatters and campers often cut down these trees for firewood, or built fires against the trunks, which

killed them. Several hundred large and valuable olive trees at the San Diego Mission were killed in this way. The old orchards were pruned and cultivated with much care, and the paths were swept by the Indians, but after the sequestration of the Mission property they were neglected and ran wild. The olive-mills and wine-presses were destroyed, and cattle were pastured in the once fruitful groves.

The flower gardens were gay with roses, chiefly a pink and very fragrant sort from Mexico, called by us the Castilian rose, and still seen in a few old gardens. Besides roses, we had pinks, sweet-peas, hollyhocks, nasturtiums which had been brought from Mexico, and white lilies. The vegetable gardens contained pease, beans, beets, lentils, onions, carrots, red peppers, corn, potatoes, squashes, cucumbers, and melons. A fine quality of tobacco was cultivated and cured by the Indians. Hemp and flax were grown to some extent. A fine large cane, a native of Mexico, was planted, and the joints found useful as spools in the blanket factory, and for many domestic purposes. The young shoots of this cane were sometimes cooked for food. Other kinds of plants were grown in the old gardens, but these are all that I can remember.

In the old days every one seemed to live out-doors. There was much gaiety and social life, even though people were widely scattered. We traveled as much as possible on horseback. Only old people or invalids cared to use the slow cart, or *carreta*. Young men would ride from one ranch to another for parties, and whoever found his horse tired would let him go and catch another. In 1806 there were so many horses in the valleys about San José that seven or eight thousand were killed. Nearly as many were driven into the sea at Santa Barbara in 1807, and the same thing was done at Monterey in 1810. Horses were given to the runaway sailors, and to trappers and hunters who came over the mountains, for common horses were very plenty, but fast and beautiful horses were never more prized in any country than in California, and each young man had his favorites. A kind of mustang, that is now seldom or never seen on the Pacific coast, was a peculiar light cream-colored horse, with silver-white mane and tail. Such an animal, of speed and bottom, often sold for more than a horse of any other color. Other much admired colors were dapple-gray and chestnut. The fathers of the Mission sometimes rode on horseback, but they generally had a somewhat modern carriage called a *volante*. It was always drawn by mules, of which there were hundreds in the Mission pastures, and white was the color often preferred.

Nothing was more attractive than the wed-

ding cavalcade on its way from the bride's house to the Mission church. The horses were more richly caparisoned than for any other ceremony, and the bride's nearest relative or family representative carried her before him, she sitting on the saddle with her white satin shoe in a loop of golden or silver braid, while he sat on the bear-skin covered *anquera* behind. The groom and his friends mingled with the bride's party, all on the best horses that could be obtained, and they rode gaily from the ranch house to the Mission, sometimes fifteen or twenty miles away. In April and May, when the land was covered with wild-flowers, the light-hearted troop rode along the edge of the uplands, between hill and valley, crossing the streams, and some of the young horsemen, anxious to show their skill, would perform all the feats for which the Spanish-Californians were famous. After the wedding, when they returned to lead in the feasting, the bride was carried on the horse of the groomsman. One of the customs which was always observed at the wedding was to wind a silken tasseled string or a silken sash, fringed with gold, about the necks of the bride and groom, binding them together as they knelt before the altar for the blessing of the priest. A charming custom among the middle and lower classes was the making of the satin shoes by the groom for the bride. A few weeks before the wedding he asked his betrothed for the measurement of her foot, and made the shoes with his own hands; the groomsman brought them to her on the wedding-day.

But few foreigners ever visited any of the Missions, and they naturally caused quite a stir. At the Mission San José, about 1820, late one night in the vintage season a man came to the village for food and shelter, which were gladly given. But the next day it was whispered that he was a Jew, and the poor Indians, who had been told that the Jews had crucified Christ, ran to their huts and hid. Even the Spanish children, and many of the grown people, were frightened. Only the missionary father had ever before seen a Jew, and when he found that it was impossible to check the excitement he sent two soldiers to ride with the man a portion of the way to Santa Clara.

A number of trappers and hunters came into Southern California and settled down in various towns. There was a party of Kentuckians, beaver-trappers, who went along the Gila and Colorado rivers about 1827, and then south into Baja California to the Mission of Santa Catalina. Then they came to San Diego, where the whole country was much excited over their hunter clothes, their rifles, their traps, and the strange stories they told of the deserts, and fierce Indians, and things that no one in Cali-

fornia had ever seen. Captain Paty was the oldest man of the party, and he was ill and worn out. All the San Diego people were very kind to the Americans. It is said that the other Missions, such as San Gabriel, sent and desired the privilege of caring for some of them. Captain Paty grew worse, so he sent for one of the fathers and said he wished to become a Catholic, because, he added, it must be a good religion, for it made everybody so good to him. Don Pio Pico and Doña Victoria Dominguez de Estudillo were his sponsors. After Captain Paty's death the Americans went to Los Angeles, where they all married Spanish ladies, were given lands, built houses, planted vineyards, and became important people. Pryor repaired the church silver, and was called "Miguel el Platero." Laughlin was always so merry that he was named "Ricardo el Buen Mozo." They all had Spanish names given them besides their own. One of them was a blacksmith, and as iron was very scarce he made pruning shears for the vineyards out of the old beaver traps.

On Christmas night, 1828, a ship was wrecked near Los Angeles, and twenty-eight men escaped. Everybody wanted to care for them, and they were given a great Christmas dinner, and offered money and lands. Some of them staid, and some went to other Missions and towns. One of them who staid was a German, John Gronigen, and he was named "Juan Domingo," or, because he was lame, "Juan Cojo." Another, named Prentice, came from Connecticut, and he was a famous fisherman and otter hunter. After 1828 a good many other Americans came in and settled down quietly to cultivate the soil, and some of them became very rich. They had grants from the governor, just the same as the Spanish people.

It is necessary, for the truth of the account, to mention the evil behavior of many Americans before, as well as after, the conquest. At the Mission San José there is a small creek, and two very large sycamores once grew at the Spanish ford, so that it was called *la aliso*. A squatter named Fallon, who lived near the crossing, cut down these for firewood, though there were many trees in the cañon. The Spanish people begged him to leave them, for the shade and beauty, but he did not care for that. This was a little thing, but much that happened was after such pattern, or far worse.

In those times one of the leading American squatters came to my father, Don J. J. Vallejo, and said: "There is a large piece of your land where the cattle run loose, and your vaqueros have gone to the gold mines. I will fence the field for you at my expense if you will give me half." He liked the idea, and assented, but when the tract was inclosed the

American had it entered as government land in his own name, and kept all of it. In many similar cases American settlers in their dealings with the rancheros took advantage of laws which they understood, but which were new to the Spaniards, and so robbed the latter of their lands. Notes and bonds were considered unnecessary by a Spanish gentleman in a business transaction, as his word was always sufficient security.

Perhaps the most exasperating feature of the coming-in of the Americans was owing to the mines, which drew away most of the servants, so that our cattle were stolen by thousands. Men who are now prosperous farmers and merchants were guilty of shooting and selling Spanish beef "without looking at the brand," as the phrase went. My father had about ten thousand head of cattle, and some he was able to send back into the hills until there were better laws and officers, but he lost the larger part. On one occasion I remember some vigilantes caught two cattle-thieves and sent for my father to appear against them, but he said that although he wanted them punished he did not wish to have them hanged, and so he would not testify, and they were set free. One of them afterward sent conscience money to us from New York, where he is living in good circumstances. The Vallejos have on several occasions received conscience money from different parts of the country. The latest case occurred last year (1889), when a woman wrote that her husband, since dead, had taken a steer worth twenty-five dollars, and she sent the money.

Every Mission and ranch in old times had its *calaveras*, its "place of skulls," its slaughter-corral, where cattle and sheep were killed by the Indian butchers. Every Saturday morning the fattest animals were chosen and driven there, and by night the hides were all stretched on the hillside to dry. At one time a hundred cattle and two hundred sheep were killed weekly at the Mission San José, and the meat was distributed to all, "without money and without price." The grizzly bears, which were very abundant in the country,—for no one ever poisoned them, as the American stock raisers did after 1849,—used to come by night to the ravines near the slaughter-corral where the refuse was thrown by the butchers. The young Spanish gentlemen often rode out on moonlight nights to lasso these bears, and then they would drag them through the village street, and past the houses of their friends. Two men with their strong rawhide reatas could hold any bear, and when they were tired of this sport they could kill him. But sometimes the bears would walk through the village on their way to or from the corral of the butchers, and so

scatter the people. Several times a serenade party, singing and playing by moonlight, was suddenly broken up by two or three grizzlies trotting down the hill into the street, and the gay *caballeros* with their guitars would spring over the adobe walls and run for their horses, which always stood saddled, with a reata coiled, ready for use, at the saddle bow. It was the custom in every family to keep saddled horses in easy reach, day and night.

Innumerable stories about grizzlies are traditional in the old Spanish families, not only in the Santa Clara Valley, but also through the Coast Range from San Diego to Sonoma and Santa Rosa. Some of the bravest of the young men would go out alone to kill grizzlies. When they had lassoed one they would drag him to a tree, and the well-trained horse would hold the bear against it while the hunter slipped out of the saddle, ran up, and killed the grizzly with one stroke of his broad-bladed *machete*, or Mexican hunting knife. One Spanish gentleman riding after a large grizzly lassoed it and was dragged into a deep *barranca*. Horse and man fell on the bear, and astonished him so much that he scrambled up the bank, and the hunter cut the reata and gladly enough let him go. There were many cases of herds-men and hunters being killed by grizzlies, and one could fill a volume with stories of feats of courage and of mastery of the reata. The governor of California appointed expert bear hunters in different parts of the country, who spent their time in destroying them, by pits, or shooting, or with the reata. Don Rafael Soto, one of the most famous of these men, used to conceal himself in a pit, covered with heavy logs and leaves, with a quarter of freshly killed beef above. When the grizzly bear walked on the logs he was shot from beneath. Before the feast-days the hunters sometimes went to the foothills and brought several bears to turn into the bull-fighting corral.

The principal bull-fights were held at Easter and on the day of the patron saint of the Mission, which at the Mission San José was March 19. Young gentlemen who had trained for the contest entered the ring on foot and on horseback, after the Mexican manner. In the bull and bear fights a hindfoot of the bear was often tied to the forefoot of the bull, to equalize the struggle, for a large grizzly was more than a match for the fiercest bull in California, or indeed of any other country. Bull and bear fights continued as late as 1855. The Indians were the most ardent supporters of this cruel sport.

The days of the *rodeos*, when cattle were driven in from the surrounding pastures, and the herds of the different ranches were separated, were notable episodes. The ranch

owners elected three or five *juezes del campo* to govern the proceedings and decide disputes. After the rodeo there was a feast. The great feast-days, however, were December 12 (the day of our Lady Guadalupe), Christmas, Easter, and St. Joseph's Day, or the day of the patron saint of the Mission.

Family life among the old Spanish pioneers was an affair of dignity and ceremony, but it did not lack in affection. Children were brought up with great respect for their elders. It was the privilege of any elderly person to correct young people by words, or even by whipping them, and it was never told that any one thus chastised made a complaint. Each one of the old families taught their children the history of the family, and reverence towards religion. A few books, some in manuscript, were treasured in the household, but children were not allowed to read novels until they were grown. They saw little of other children, except their near relatives, but they had many enjoyments unknown to children now, and they grew up with remarkable strength and healthfulness.

In these days of trade, bustle, and confusion, when many thousands of people live in the Californian valleys, which formerly were occupied by only a few Spanish families, the quiet and happy domestic life of the past seems like a dream. We, who loved it, often speak of those days, and especially of the duties of the large Spanish households, where so many dependents were to be cared for, and everything was done in a simple and primitive way.

There was a group of warm springs a few miles distant from the old adobe house in which we lived. It made us children happy to be waked before sunrise to prepare for the "wash-day expedition" to the *Agua Caliente*. The night before the Indians had soaped the clumsy *carreta's* great wheels. Lunch was placed in baskets, and the gentle oxen were yoked to the pole. We climbed in, under the green cloth of an old Mexican flag which was used as an awning, and the white-haired Indian *ganan*, who had driven the *carreta* since his boyhood, plodded beside with his long *garrocha*, or ox-goad. The great piles of soiled linen were fastened on the backs of horses, led by other servants, while the girls and women who were to do the washing trooped along by the side of the *carreta*. All in all, it made an imposing cavalcade, though our progress was slow, and it was generally sunrise before we had fairly reached the spring. The oxen pulled us up the slope of the ravine, where it was so steep that we often cried, "Mother, let us dismount and walk, so as to make it easier." The steps of the *carreta* were so low that we could climb in or out without

stopping the oxen. The watchful mother guided the whole party, seeing that none strayed too far after flowers, or loitered too long talking with the others. Sometimes we heard the howl of coyotes, and the noise of other wild animals in the dim dawn, and then none of the children were allowed to leave the *carreta*.

A great dark mountain rose behind the hot spring, and the broad, beautiful valley, unfenced, and dotted with browsing herds, sloped down to the bay as we climbed the cañon to where columns of white steam rose among the oaks, and the precious waters, which were strong with sulphur, were seen flowing over the crusted basin, and falling down a worn rock channel to the brook. Now on these mountain slopes for miles are the vineyards of Josiah Stanford, the brother of Senator Leland Stanford, and the valley below is filled with towns and orchards.

We watched the women unload the linen and carry it to the upper spring of the group, where the water was best. Then they loosened the horses, and let them pasture on the wild oats, while the women put home-made soap on the clothes, dipped them in the spring, and rubbed them on the smooth rocks until they were white as snow. Then they were spread out to dry on the tops of the low bushes growing on the warm, windless, southern slopes of the mountain. There was sometimes a great deal of linen to be washed, for it was the pride of every Spanish family to own much linen, and the mother and daughters almost always wore white. I have heard strangers speak of the wonderful way in which Spanish ladies of the upper classes in California always appeared in snow-white dresses, and certainly to do so was

one of the chief anxieties of every household. Where there were no warm springs the servants of the family repaired to the nearest *arroyo*, or creek, and stood knee-deep in it, dipping and rubbing the linen, and enjoying the sport. In the rainy season the soiled linen sometimes accumulated for several weeks before the weather permitted the house mistress to have a wash-day. Then, when at last it came, it seemed as if half the village, with dozens of babies and youngsters, wanted to go along too and make a spring picnic.

The group of hot sulphur-springs, so useful on wash-days, was a famed resort for sick people, who drank the water, and also buried themselves up to the neck in the soft mud of the slope below the spring, where the waste waters ran. Their friends brought them in litters and scooped out a hole for them, then put boughs overhead to shelter them from the hot sun, and placed food and fresh water within reach, leaving them sometimes thus from sunrise to sunset. The Paso Robles and Gilroy Springs were among the most famous on the coast in those days, and after the annual *rodeos* people often went there to camp and to use the waters. But many writers have told about the medicinal virtues of the various California springs, and I need not enlarge upon the subject. To me, at least, one of the dearest of my childish memories is the family expedition from the great thick-walled adobe, under the olive and fig trees of the Mission, to the *Agua Caliente* in early dawn, and the late return at twilight, when the younger children were all asleep in the slow *carreta*, and the Indians were singing hymns as they drove the linen-laden horses down the dusky ravines.

Guadalupe Vallejo.

CALIFORNIANA.

Trading with the Americans.

IN the autumn of 1840 my father lived near what is now called Pinole Point, in Contra Costa County, California. I was then about twelve years old, and I remember the time because it was then that we saw the first American vessel that traded along the shores of San Pablo Bay. One afternoon a horseman from the Peraltas, where Oakland now stands, came to our ranch, and told my father that a great ship, a ship "with two sticks in the center," was about to sail from Yerba Buena into San Pablo and Suisun, to buy hides and tallow.

The next morning my father gave orders, and my brothers, with the peons, went on horseback into the mountains and smaller valleys to round up all the best cattle. They drove them to the beach, killed them there, and salted the hides. They tried out the tallow in some iron kettles that my father had bought from one of the Vallejos, but as we did not have any bar-

rels, we followed the common plan in those days. We cast the tallow in round pits about the size of a cheese, dug in the black adobe and plastered smooth with clay. Before the melted tallow was poured into the pit an oaken staff was thrust down in the center, so that by the two ends of it the heavy cake could be carried more easily. By working very hard we had a large number of hides and many pounds of tallow ready on the beach when the ship appeared far out in the bay and cast anchor near another point two or three miles away. The captain soon came to our landing with a small boat and two sailors, one of whom was a Frenchman who knew Spanish very well, and who acted as interpreter. The captain looked over the hides, and then asked my father to get into the boat and go to the vessel. Mother was much afraid to let him go, as we all thought the Americans were not to be trusted unless we knew them well. We feared they would carry my father off and keep him a prisoner. Father said, however, that it was all right: he went

and put on his best clothes, gay with silver braid, and we all cried, and kissed him good-by, while mother clung about his neck and said we might never see him again. Then the captain told her: "If you are afraid, I will have the sailors take him to the vessel, while I stay here until he comes back. He ought to see all the goods I have, or he will not know what to buy." After a little my mother let him go with the captain, and we stood on the beach to see them off. Mother then came back, and had us all kneel down and pray for father's safe return. Then we felt safe.

He came back the next day, bringing four boat-loads of cloth, axes, shoes, fish-lines, and many new things. There were two grindstones and some cheap jewelry. My brother had traded some deerskins for a gun and four tooth-brushes, the first ones I had ever seen. I remember that we children rubbed them on our teeth till the blood came, and then concluded that after all we liked best the bits of pounded willow root that we had used for brushes before. After the captain had carried all the hides and tallow to his ship he came back, very much pleased with his bargain, and gave my father, as a present, a little keg of what he called Boston rum. We put it away for sick people.

After the ship sailed my mother and sisters began to cut out new dresses, which the Indian women sewed. On one of mine mother put some big brass buttons about an inch across, with eagles on them. How proud I was! I used to rub them hard every day to make them shine, using the tooth-brush and some of the pounded egg-shell that my sisters and all the Spanish ladies kept in a box to put on their faces on great occasions. Then our neighbors, who were ten or fifteen miles away, came to see all the things we had bought. One of the Moragas heard that we had the grindstones, and sent and bought them with two fine horses.

Soon after this I went to school, in an adobe, near where the town of San Pablo now stands. A Spanish gentleman was the teacher, and he told us many new things, for which we remember him with great respect. But when he said the earth was round we all laughed out loud, and were much ashamed. That was the first day, and when he wrote down my name he told me that I was certainly "La Cantinera, the daughter of the regiment." Afterward I found out it was because of my brass buttons. One girl offered me a beautiful black colt she owned for six of the buttons, but I continued for a long time to think more of those buttons than of anything else I possessed.

Prudencia Higuera.

"The Date of the Discovery of the Yosemite."

YOUR correspondent, Mr. Bunnell, in the September CENTURY, writes an interesting account of his discovery of the Yosemite, March 5, 1851. I am sorry to despoil him of the honor of being the first

discoverer, but a truthful regard for history makes it my duty to fix an earlier date.

During the month of January, 1851, I was making a tour of observation along the western slope of the Sierra of California in company with Professor Forrest Shepard of New Haven, Conn., and Professor Nooney, formerly of Western Reserve College, Ohio. Between the 12th and 15th of January we halted at the trading post established by Coulter, who was then and there doing a prosperous business in selling supplies to the gold miners in the vicinity. The locality, I believe, is now known as Coulterville, and is about twenty-five miles west of the Yosemite Cañon. We stopped there overnight, and during our stay heard from some of the men assembled in Coulter's store the following incidents, of which they said they had been witnesses or participants.

There had been some friction and disturbance in the relations of Indians and whites, but the open and general hostility which gave occasion for the subsequent movements of the "Mariposa Battalion" had not commenced at the time of our visit. The first serious quarrel occurred a few days before, when six Indians came to a trading tent in the Coulter camp and a drunken ruffian from Texas, without any reasonable cause, stabbed to the heart the chief of their party. The other five Indians with their bows and arrows at once shot the Texan, and having killed him retreated to the forest. Two nights later a pack of sixteen mules were stolen from Coulter's corral and driven off into the mountains by Indians.

Great excitement prevailed, and a company of about one hundred men from the camp and vicinity armed themselves and started on the trail. They followed the tracks into the great cañon and surprised the Indians, who had already converted the mules into jerked meat and had hung it up to dry. They had the satisfaction of slaughtering a large number of the Indians, with their squaws and papooses. They noticed especially the grandeur that surrounded the battlefield. They had returned from the expedition just before our arrival. In narrating their story they gave no name to the cañon, but gave us a description such as could apply to no place on earth other than the Yosemite. I made no record of the names of these discoverers, for what with the big trees, big lumps of gold, and other wonders that were seen and heard of daily, a big rift in the mountains would not be thought exceptional or extraordinary.

If Mr. Coulter or any of his associates are still living they can probably give the names, besides adding other valuable information.

I fix the date of the fight at the Yosemite, and thus of the discovery by the company of men who went from Coulter's January 10, 1851, as proximate, if not exact, both from memory and from corroborative records.

MONTCLAIR, N. J.

Julius H. Pratt.

SOME VIEWS ON ACTING.¹

BY TOMMASO SALVINI.

TO my quiet country villa among the woods of Vallombrosa some echoes reached of the friendly controversy which seems to have been waged in American and English magazines and newspapers regarding one of the underlying principles of the art to which I have devoted my life; a controversy in which were ranged on opposite sides two such eminent actors as Mr. Henry Irving and M. Constant Coquelin. These echoes have remained ringing in my ears until, despite the fact that I think an actor is as a rule better employed in studying the words of others than in committing phrases of his own to paper, I have ventured to shape, as briefly and simply as possible, my own views on the point in dispute. This point, if I have rightly understood it, resolves itself mainly into the simple question, Should an actor feel positively and be moved by the emotions he portrays, or should he be entirely negative and keep his own emotion at arm's length, as it were, and merely make his audience believe that he is moved?

Let me, in the first place, frankly state my own opinion, warning my readers first of all that it is merely an opinion (for questions of art can never be solved definitely, like a mathematical problem), and then I can at greater length strive to show why I hold such views. I believe, then, that every great actor ought to be, and is, moved by the emotion he portrays; that not only must he feel this emotion once or twice, or when he is studying the part, but that he must feel it in a greater or less degree — and to just that degree will he move the hearts of his audiences — whenever he plays the part, be it once or a thousand times, and that he must cultivate this susceptibility to emotion as carefully as he cultivates the development of his vocal organs, or the habit of moving and walking easily and gracefully. This is what I believe and always have believed, and I think it must be acknowledged that my position as to the point at issue is no doubtful one.

M. Coquelin, on the other hand, maintains, if I rightly interpret his extremely well and forcibly put expression of opinion, that an actor

should remain perfectly calm and collected however stormy may be the passion he is portraying; that he should merely make believe, as it were, to feel the emotion he strives to make the audience believe he really feels, and that he should act entirely with his brain and not with his heart, to typify by physiological organs two widely differentiated methods of artistic work. That M. Coquelin really and truly believes this somewhat paradoxical theory and endeavors to put his theory into practice, I do not for one moment doubt. Accomplished and versatile artist as he is, I have been struck more than once, as I have enjoyed the pleasure of his performances, with the thought that something amid all the brilliancy of execution was lacking; and this want, so apparent, was due, I apprehend, to the fact that one of the most skillful artists in the world was deliberately trying to belittle himself and the art of which it was in his power to raise the interpretation to such lofty heights. The actor who does not feel the emotion he portrays is but a skillful mechanic, setting in motion certain wheels and springs which may give to his lay figure such an appearance of life that the observer is tempted to exclaim: "How marvelous! Were it only alive 't would make me laugh or weep." He who feels, on the contrary, and can communicate this feeling to the audience, hears the cry: "That *is* life! That *is* reality! See—I laugh! I weep!" It is, in a word, the power of feeling that marks the artist; all else is but the mechanical side which is common to all the arts. There are many born actors who have never faced an audience, as there are many true poets who have never written a verse, and painters who have never taken a palette in hand. To some only is given the power of expression as well as of feeling, and they become artists in the sight of the world as the others are in the sight of our semi-divine mistress, the Art universal.

It is at this point that I approach more closely to M. Coquelin. "The actor," he says in effect, "must carry self-restraint so far that where the creature he simulates would burn, he must be cold as ice. Like callous scientist, he must dissect each quivering nerve and lay bare each throbbing artery, all the time keeping himself impassive as one of the gods of old Greece, lest a rush of hot heart's blood

¹ Translated by Alexander Salvini and Horace Townsend.

come and spoil his work." I also say that the actor must have the gift of impassivity, but to a certain point only. He must feel, but he must guide and check his feeling as a skillful rider curbs and guides a fiery horse, for he has a double part to play: merely to feel himself is not enough; he has to make others feel, and this he cannot do without the exercise of restraint. Let me make use of an instance afforded me by M. Coquelin himself. Once, he says, he was tired before he came on the stage, and falling sound asleep when feigning sleep, he snored real snores instead of feigned ones. The result was, he tells us, that he never snored so badly. Naturally so, since he had lost control of the steed of feeling, by the fact of his sleeping, and so it ran away and carried him he knew not where; but had M. Coquelin at some time in his experience shed real tears, while at the same time in full possession of his waking faculties, and had he been able to guide those tears into the channel that his artistic sense told him to be the right one, then we should not have heard that the audience found those real tears less effective than tears wholly feigned and the product of intellect rather than of feeling.

Raphael, when he painted his Madonnas, shed real tears, not imitative ones, and the result we know. Michael Angelo in earnest threatened his statue because it did not breathe; but I do not think M. Gérôme or M. Bouguereau, the talented countrymen of M. Coquelin, admirable as their work is, feel any acute emotion as they produce their pictures so brimful of astonishing technique, and, may I be permitted to hint, so wanting in soul and feeling.

It is difficult for me to write on a subject such as this without incurring, or running the risk of incurring, the reproach of being egotistical. I cannot, however, refrain from referring to my own experience and my own methods in some degree, especially as by so doing I can, I doubt not, make more clear the theory I hold than by any other means; for I shall be able, as it were, to show not only how I put my theory into practice, but what the visible results have been. That I am chiefly guided by feeling is probably the reason that I have never been able to play with satisfaction, either to my audience or to myself, any part with which I have not full sympathy, and of late years I have not even attempted any such part. This attitude of mine towards his creations should, I conceive, be assumed in a greater or less degree by every actor who has a part to play, and not be confined simply to those who, like myself, have identified themselves more closely with what, for want of a better term, I may call "heroic" rôles. One may sympathize even with a villain and yet

remain an honest man, so that in counseling a student first of all to put himself in sympathy with his character I am by no means urging on him the acquirement of even the remotest obliquity of moral vision. After having satisfied myself that the character I was about to attempt was one with whom I could put myself in full sympathy, I have next set myself laboriously to study its inner nature, concerning myself not one particle with the outward characteristics or the points wherein the supposititious being might differ in his figure, bearing, or speech from the rest of his fellow-men. These are trifles, the simulation of which is, or ought to be, within the scope of any actor who has learned his trade and is skilled in the mechanics of his art. What is of supreme importance, though, is the mental and spiritual differentiation of the character from those around him. As to how I actually attain this object I can speak in no way that could be clearly understood by my readers, for I do not clearly understand the process myself. It is perhaps at this point that what we are wont to call inspiration comes to our assistance, and helps to elevate the artist above the artisan. Now, having got in touch with inner workings of my character's nature, by this process of spiritual dissection, which I find it so difficult to classify, I proceed by slow degrees to an understanding of how he would speak and act in the various situations in which he has been placed by the dramatist, and here I am on surer ground, so far as giving some comprehension of the means I adopt towards the end is concerned. I simply try *to be* the character I am playing; to think with his brain, to feel with his feelings, to cry with him and to laugh with him, to let my breast be anguished by his emotions, to love with his love and to hate with his hate. Then having thus hewn my creation out of the block of marble provided me by the dramatist, I clothe him with his proper clothes and endue him with his proper voice, his tricks of gesture, his walk — in short, his outward and bodily appearance, as distinct from, though doubtless depending upon, his inward and spiritual fashioning. When this is completed to my satisfaction, when I have my man shaped, both in his inner and outer being, as I would have him, I am ready to place him before my public, and they help me to his further completion. M. Coquelin, doubtless, if he adheres with fidelity to his admirably expressed theories, could play a part as successfully and artistically in an empty room as in a crowded theater. I must confess that I could not. I cannot live my mimic life save in the glare of the footlights; for it is only the sympathy and feeling of my audience which react upon me and allow me, on my part, to

cause my audience to sympathize and feel with me. But what I particularly wish to impress upon my readers is, that while I am acting I am living a dual life, crying or laughing on the one hand, and simultaneously so dissecting my tears and laughter that they may appeal most forcibly to those whose hearts I wish to reach. And what is my experience has been the experience of all the greatest artists I have known. Ristori shed actual tears night after night, as she herself has told me; while one of the most gifted of comedians it has ever been my pleasure to know has assured me that he entered so fully into the spirit of the character he was playing that he became to all intents and purposes one with him, enjoying his humor as though he himself had fathered it.

That this susceptibility of the emotions tends to uneven or unequal impersonations of the same character by the same actor on different occasions, I absolutely deny. That the jealously conscientious soul of the artist is at times troubled by the consciousness that on some certain occasion he has not equaled his own best work is doubtless true; though, as I conceive it, the conscience of the devotee of the mechanical system must be equally touched at times, for even the most skillful wood-turner cannot every day turn his rings of exactly equal size and shape. But if this difference is due to the emotional nature gaining too great control and taking the mental bit into its mouth instead of being guided by it, then art is lacking, and knowledge and skill of craft also. There are actors, it is true, who allow themselves to be guided by the emotion of the moment; there is one who by her genius has added lus-

ter to the American stage; but, genius notwithstanding, they are not artists in the truest sense of the word. This is the Scylla of unrestrained, untrained, and disproportionate emotion, akin almost to hysteria, which we must avoid, while at the same time keeping clear from the Charybdis of cold, deliberate mechanical artificiality, which leads indubitably to monotony of method and treatment, and to consequent lack of the art which conceals the art and its mechanism from the most keen-eyed of watchful spectators.

I gather that M. Coquelin deplors the tendency of the day to subordinate the actor to the costumer and scene-painter—a tendency which will, in my judgment, after working an infinity of harm to art, end by being swept away by a reaction which will carry us back to something akin to the archaic simplicity of the days of Shakspeare, Molière, and Alfieri, or, to go even farther along the corridors of time, to those of Sophocles and Euripides. I deplore it, I say, and yet I fail to see that it is more dangerous to the art we both love than would be the general adoption of the views he has so eloquently, and in a manner so much more graceful than my own, espoused; views which would degrade the art of acting to the level of mere mimicry and make of the actor but a cleverly articulated piece of mechanism, informed by no breath of that Promethean fire we call genius; views which would inevitably make of the stage a means but to amuse, and would rob it of all claim to be considered as a channel of as ennobling an art in its highest aspect as can be claimed by poet, sculptor, or painter.

Tommaso Salvini.

TO A FRIEND ACROSS THE SEA.

(w. c.)

BUT once or twice we met, touched hands.
To-day between us both expands
A waste of tumbling waters wide,
A waste by me as yet untried,
Vague with the doubt of unknown lands.

Time like a despot speeds his sands:
A year he blots, a day he brands;
We walked, we talked by Thamís' side
But once or twice.

What makes a friend? What filmy strands
Are these that turn to iron bands?
What knot is this so firmly tied
That naught but fate can now divide?—
Ah, these are things one understands
But once or twice!

Austin Dobson.

FRANKLIN IN ALLEGORY.

THE Frenchman's American is Benjamin Franklin. It was so when they first began to know him, when he went in and out among them a living man, and it is so to-day, when an even century has closed around

his simple tomb. There is something grand in the personality of this man who was able to inspire such deep admiration and such sinister hatred by the same act. Benjamin Franklin was, without doubt, a strong man—a man of strong and positive character, whose friends and enemies were equally strong in their feelings of like and dislike. The men who were ranged as his enemies have been relegated to a second place on the page of history, while those who were his friends stand out boldly in the front rank of the notable characters of the past. If we were asked to say what was the characteristic in Franklin that made him an idol among the French nation, we should answer his versatility. He was the adroit diplomat and the simple bourgeois, the learned philosopher and scientist, and the gay *bon vivant* and *bonhomme*. He could write a despatch or an epigram with equal facility, and he could control the electric fluid and a smoky chimney with equal success. He at turns could be the chivalric courtier or the simple representative of the infant republic, and whatever he did or whatever pose he assumed he was the same peerless Franklin; and now that he has been at rest these hundred years he stands forth on the page of history as the first American—not even second to Washington himself.

It was a sarcasm of Rufus Choate that Pennsylvania's two most distinguished citizens were Benjamin Franklin, a native of Massachusetts, and Robert Morris, a native of Great Britain; and while the slur is perhaps unfortunately true, Pennsylvania's native sons should be none the less proud of these two first citizens. Yet it would seem from the way she places herself upon record that she rather accepts and emphasizes the slur, and, instead of rising above the prejudice of birth, endeavors to elevate to the foremost place those of lesser rank. If one looks around the rotunda of the Capitol at Washington, at the statues intended to commemorate the first

citizens of the several States, in vain will search be made for the statue of Benjamin Franklin as the first citizen of the Keystone State. Unfortunately kissing goes by favor and not by right, or Peter Muhlenberg and Robert Fulton would not look down from the pedestals that should bear Franklin and Morris, or Penn, or Logan, or Rush, or Rittenhouse, or Wayne, or Mifflin, or McKean.

This digression has taken us some little distance away from our text, but it is suitable matter for introduction.

The French have ever been ready to sanctify their heroes in allegory. It has been a favorite method with them to show how much above ordinary mortals every one of their favorites is; and so it came to be Franklin's turn during his sojourn in France to be embalmed in this way. These historical works of art are not common, and are not familiar to many, even among students of art and history, and it seems as if the present was a proper occasion to bring these allegories to public notice and attention.

It was on the night of Saturday, the seventeenth day of April, 1790, that Benjamin Franklin died, at the advanced age of eighty-four years and three months, and on the following Wednesday the Boston printer-boy, the Pennsylvania lawgiver, the American diplomat, and the world's philosopher was laid to rest in Christ Church burying-ground, at Fifth and Arch streets, Philadelphia.

He had provided for his resting-place by a codicil to his will, dated June 23, 1789:

I wish to be buried by the side of my wife, if it may be, and that a marble stone to be made by Chambers, six feet long, four feet wide, plain, with only a small moulding round the upper edge, and this inscription,

BENJAMIN	}	FRANKLIN,
AND		
DEBORAH		
178—		

to be placed over us both.

Unostentatious in life, he desired to preserve the same character after death, and his wishes have been obeyed.

So much has lately been written upon "Franklin in France" that were it not that the theme chosen for this commemorative paper necessitates some reference to his career there, it would be studiously avoided. At the same

time it must be admitted that it was the most important service of his life and until recently the least understood.

Franklin visited Paris first in 1767, and again in 1769, when he was welcomed for his scientific writings and his dissertations on economics. This introduction formed the entering wedge for his greater popularity when he returned, some years later, as commissioner with Arthur Lee and Silas Deane, for it must be remembered that it was not until after the Treaty of Alliance was made that the joint commission was abolished and Franklin chosen minister plenipotentiary. His commission, which was carried to him by Lafayette, is not known to be in print, and we copy it from a duplicate original in the archives of the Pennsylvania Historical Society.

TO OUR GREAT, FAITHFUL, AND BELOVED FRIEND AND ALLY, LOUIS THE SIXTEENTH, KING OF FRANCE AND NAVARRE.

Great, faithful, and beloved Friend and Ally : The principles of Equality and Reciprocity on which you have entered into Treaties with us give you an additional security for that good faith with which we have observed them from motives of Honor and of Affection to your Majesty. The distinguished part you have taken in the support of the Liberties and Independence of these States cannot but inspire them with the most ardent wishes for the Interest and the glory of France.

We have nominated Benjamin Franklin, Esqur., to reside at your Court in quality of our Minister Plenipotentiary that he may give you more particular assurances of the grateful sentiments which you have excited in us and in each of the United States. We beseech you to give entire Credit to everything which he shall deliver on our Part, especially when he shall assure you of the Permanency of our Friendship, and we pray God that He will keep your

INDEPENDENT AMERICA.

Majesty, our great, faithful, and beloved Friend and Ally, in his most holy Protection.

Done at Philadelphia the twenty-first day of October, 1778, by the Congress of the United States of North America, your good Friends and Allies.

HENRY LAURENS, *Presd.*

Attest : CHAS. THOMSON, *Secy.*

In announcing this appointment to his cousin, Jonathan Williams, Franklin writes from Passy, February 13, 1779 :

I have the pleasure of acquainting you that the Congress have been pleased to honor me with a sole appointment to be their Minister Plenipotentiary at this Court, and I have just received my credentials. This mark of public confidence is more agreeable to me as it was not obtained by any solicitation or intrigue on my part, nor have I ever written a syllable to any person in or out of Congress magnifying my own services or diminishing those of others.

It was the combination of fortuitous circumstances that made Franklin's reception in

France so cordial and enthusiastic. The French people were permeated with the doctrines of Rousseau, Voltaire, and Montesquieu, and they saw in the struggling colonies an attempt to put these doctrines into practice: therefore they saw in Franklin the living representative of these ideas. He was immediately received by that brilliant coterie of philosophers, the Encyclopedists, into their circle. D'Alembert, Diderot, Morellet, and Condorcet were his companions, and Turgot and Beaumarchais his friends. By his manners and ways of life he became the most popular man in France, so that when he gained his presentation to the king his future was assured. As he passed through the streets of Paris he was followed by admiring eyes and cheered loudly by enthusiastic voices. A contemporary writes: "A friend of mine paid something for a place at a two-pair-of-stairs window to see him pass by in his coach, but the crowd was so great that he could but barely say he saw him." He was the Frenchman's embodiment of the ideal citizen, republican, philosopher, and friend. He completely captivated and captured the people of France, whom he perfectly understood, and he well knew "that a popular man becomes soon more powerful than power itself." Condorcet said: "It was an honor to have seen him. People repeated what they had heard him say. Every fête which he consented to receive, every house where he consented to go, spread in society new admirers, *who became so many partisans of the American Revolution.*"

There are plenty of proofs that both the king and the queen individually were opposed to the cause of America, but the will of the people was beginning already to be felt and here gained its first control. In snatching the scepter from the tyrant, as Turgot wrote, Franklin gave a lesson to France which made Marie Antoinette later exclaim, "To-day we pay dear on account of our infatuation and enthusiasm for the American war." In the midst of the commotion of the French Revolution Franklin died, and France halted and went into mourning for Franklin; while Mirabeau pronounced his eulogy before the National Assembly, in which he said, "Antiquity would have raised altars to the powerful genius who for the good of man, embracing in his thoughts heaven and earth, could subdue lightning and tyrants."

The origin and authorship of this most appropriate inscription for Franklin, "*Eripuit cœlo fulmen sceptrumque tyrannis*," has from time to time been discussed and questioned and generally ascribed to some classic writer of antiquity. There seems, however, to be no reasonable doubt that we owe it to the classic pen of Turgot. These beautiful words

are closely connected with the recognition of American Independence, and have always excited both interest and curiosity. Franklin was asked for his opinion upon a translation into French of this verse, which, he being the subject of, he declined to give, "except that it ascribes too much to me, specially in what relates to the tyrant, the Revolution having been the work of many able and fair men, wherein it is sufficient honor for me if I am allowed a small share." It was especially composed for an "Inscription for a portrait of Benjamin Franklin" soon after the doctor reached Paris on his mission for our recognition, and was very generally so used. This same Turgot, a quarter of a century before American independence, when a mere youth of twenty-three, in a prize essay had foreshadowed that event. He said: "Colonies are like fruits, which do not hold to the tree after their maturity. Having become sufficient in themselves, they do that which Carthage did, *that which America will one day do.*"

Franklin's portrait was everywhere, in painting, in sculpture, and in engraving, until it was said by a gossip of the day "to be found at the hearth of the poor and in the boudoir of the beautiful." It was especially engraved in a circle an inch and a half in diameter for the purpose of being worn in the case of a watch, and an ode was written upon seeing a watch thus embellished. His bust during the festival of Liberty was elevated with those of Rousseau and Voltaire. Writing to his daughter in 1779, upon a certain medallion portrait she had referred to, he said:

A variety of others have been made since of different sizes; some to be set in the lids of snuff-boxes and some so small as to be worn in rings; and the numbers sold are incredible. These, with the pictures, busts, and prints (of which copies upon copies are spread everywhere), have made your father's face as well known as that of the moon, so that he durst not do anything that would oblige him to run away, as his phiz would discover him wherever he would venture to show it. It is said by learned etymologists that the name *doll* for the images children play with is derived from the word *idol*. From the number of *dolls* now made of him he may be truly said in that sense to be *i-doll-ified* in this country.

These are the playful words of the man of whom a distinguished French historian said: "Men imagined they saw in Franklin a sage of antiquity come back to give austere lessons and generous examples to the moderns. They personified in him the republic of which he was the representative and the legislator. They regarded his virtues as those of his countrymen, and even judged of their physiognomy by the imposing and serene traits of his own. Happy was he who could gain admittance to

see him in the house which he occupied. This venerable old man, it was said, joined to the demeanor of Phocion the spirit of Socrates."

His closing days were filled with apprehensions for his old friends in France. The Revolution, which was the natural outgrowth of the infatuation and enthusiasm felt for our Revolution, had assumed its terrific aspect. Upon astonishment being expressed to him at the course of events in France, he is related to have said:

Why, I see nothing irregular in all this, but, on the contrary, what might naturally be expected. The French have served an apprenticeship to liberty in this country, and now that they are out of their time they have set up for themselves.

"*L'Amérique Indépendante*."—This is the title of the illustration on page 198, which was designed by A. Borel, 1778, and engraved in line by J. C. Levasseur. The plate is dedicated to the Congress of the United States by its author, and as near as the dates can be fixed it is the earliest effort at apotheosizing Franklin in this pictorial manner, as it is also the most elaborate in design and execution. Franklin is of course the central figure, and appears in the severe classical costume of a Roman senator—bare legs and sandals, toga and tunic, and a wreath of oak leaves upon his head. His right hand rests upon the shoulder of America, represented by a female wearing a crown of chicken feathers, kneeling at the base of a statue of Liberty, whence a tortoise is creeping away. To the right, Mercury with the caduceus and Ceres with her foot on a plowshare are intently watching the tortoise making its way over to Britannia, who has fallen beneath the club of Hercules upon the prostrate body of Neptune, whose trident is snapped in twain. Over Franklin and America hovers Victory. The engraved surface is 14 x 19, and what nowadays would probably be called the *remarque* are thirteen rings linked together around a harp entwined with the legend "*Majora minorib, Consonat*." Each ring is inscribed with the name of one of the original States. On each side are emblems of peace and plenty.

"*Le Docteur Franklin couronné par la Liberté*."—The "Pennsylvania Gazette" for March 31, 1779, gives the following description of this plate, then lately engraved in Paris:

The principal figure is the Genius of Liberty descending—one foot on the earth, both arms fully extended, and a wreath of laurel in each hand. She is surrounded with light, while clouds, representing Ignorance and Slavery, are driven back by her presence. Before her is a bust of the doctor, which she is in the act of crowning with laurels; and the cause of her doing so is expressed by a globe on his

right hand, America in view, with an olive branch bearing fruit running up it. Behind, and leaning on the globe, is the genius of the doctor, with the sword of justice and other emblems in its right hand; in its left is a scroll, falling upon the globe, on which is inscribed, "Constitution of the Government of Pennsylvania." In front of the globe is a bundle of fasces bound with olive branches, also bearing fruit, representing future union, peace, and plenty. The crowning of the bust expresses the honors which will be paid to his memory. Under the whole is inscribed, "Dr. Franklin crowned by Liberty."

The description of the engraving in the "Pennsylvania Gazette" is not quite correct, as will be seen by the illustration. The bust of the doctor is placed on the globe which has America in view, and not to "his [the doctor's] right hand." The figure representing the genius of the doctor is leaning against the globe with his left arm around the pedestal of the bust, etc. This plate, 7 x 9, is aqua-tinted, giving the appearance of an India-ink drawing.

"*Au Génie de Franklin*."—In the "Pennsylvania Packet," June 3, 1780, we read:

The love and attachment of the French nation for America is carried at this time to such a degree of enthusiasm as is difficult to be conceived. There are few personages that have borne an interesting part in this contest but have employed the hands of the most famous artists, and the pens of the brightest geniuses of that nation. But among so many illustrious characters the celebrated Dr. Franklin is distinguished in a particular manner; and of the several homages that are incessantly offered to his merit none must ever have been more flattering to him than the provinces of France contending with each other for having given birth to some of his ancestors, and endeavoring to prove by similarity of names that this great man derives his descent from among them—an honor of which, since the days of Homer, who exciting a like dispute among seven of the most flourishing cities of Greece, nobody has even been thought worthy.

The following extract from the "Gazette of Amiens," the capital of Picardy, in France, is the most convincing proof of what has been just now advanced: "Mr. Fragonard, the king's painter at Paris, has lately displayed the utmost efforts of his genius in an elegant picture dedicated to the genius of Franklin. Mr. Franklin is represented in it opposing with one hand the ægis of Minerva to the thunderbolt, which he first knew how to fix by his conductors, and with the other commanding the god of war to fight against avarice and tyranny; whilst America, nobly reclining upon him, and holding in her hand the fasces, a true emblem of the union of the American States, looks down with tranquillity on her defeated enemies. The painter, in this picture, most beautifully expressed the idea of the Latin verse, which has been so justly applied to Mr. Franklin:

Eripuit cœlo fulmen sceptrumque tyrannis.

(He snatched the thunderbolt from heaven and the scepter from the hands of tyrants.)

PAINTED BY CHARLES WILLSON PEALE.

ENGRAVED BY H. VELTER.

B. Franklin

"HE SNATCHED THE THUNDERBOLT FROM HEAVEN AND
THE SCEPTER FROM TYRANTS."

"The name of Franklin is sufficiently celebrated that one may glory in bearing it; and a nation prides herself in having given birth to the ancestors of a man who has rendered that name so famous. We think ourselves entitled to dispute with the English nation an honor of which they have rendered themselves so unworthy. Franklin appears rather to be of a French than of an English origin. It is certain that the name of Franklin, or Franquelin, is very common in Picardy, especially in the district of Vimeu and Ponthieu. It is very probable that one of the doctor's ancestors has been an inhabitant of this country, and has gone over to England with the fleet of Jean de Biencourt, or that which was fitted out by the nobility of this province. In genealogical matters there are bolder conjectures than this. There was at Abbeville, in the fifteenth and sixteenth centuries, a family of the name of Francklin. We see in the public records of the town one John and Thomas Franquelin, woolen drapers, in 1521. This family remained at Abbeville till the year 1600; they have since been dispersed through the country, and there are still some of their descendants so far as Auz le Château. These observations are a new homage which we offer to the genius of Franklin."

The picture of which we have the above contemporary description, 15 x 19, was etched as well as designed by Fragonard, and is full of spirit and artistic sentiment.

"*Le Tombeau de Voltaire.*"—Voltaire returned to Paris in February, 1778, after an exile of twenty-eight years, and three months later he was dead. The story of the meeting of Franklin and Voltaire, and the benediction of "God and liberty," which the latter pronounced upon the little grandson of the for-

mer, and how, upon their first joint appearance in public, the people clamored for the two philosophers to embrace according to the custom of the country, calling forth the exclamation that "Solon embraced Sophocles," are too trite to bear repeating here; but the way the people of France joined the two men in their thoughts is noticeable and aptly shown by this illustration. The incident represented was suggested, most probably, by an account of the meeting of the Masonic Lodge of the Nine Sisters to commemorate Voltaire, when "a huge sepulchral pyramid reminded the audience for what purpose they were gathered." When the eulogy had been pronounced "the pyramid vanished, and in its place stood a huge picture of the apotheosis of Voltaire." This was followed by placing a crown upon the head of Franklin and others, which they, in turn, laid before the apotheosis as a tribute to the dead sage of Ferney. It doubtless was as a reminiscence of this occasion that the print under consideration was produced which is "Dédié à Madame la Marquise de Villette, Dame de Ferney."

The following is a translation of the description that appears upon the print:

Near a cloistered Gothic portal is seen a tomb and a pyramid raised to the manes of the singer of Henri. The four quarters of the globe are personified—Europe by the illustrious D'Alembert; Asia by Catharine II., Empress of the Russians; Africa by the sovereign and learned Prince Oronoco; and America by the erudite and liberator, Franklin. These sovereigns and genii, after having shed their tears upon the tomb of the father of the fine arts, are making ready to ornament it with crowns and palms, when suddenly they find themselves repulsed by the foolhardy and pitiless prejudice of Ignorance, who, armed with rods and supported by infernal wings, rushes from his cavern and endeavors

DR. FRANKLIN CROWNED BY LIBERTY.

MIRABEAU CROWNED BY FRANKLIN.

to oppose himself to the homage about to be rendered from the four quarters of the earth. Another monument is disclosed in the distance—that of the philosopher of Geneva, who reposes in “l’Isle des Peupliers,” consecrated to him by kind friends. Many persons of all ages are expressing by their actions the philosophy of his “Emile.”

Franklin here again appears in the severe garb of the ancients, excepting the headdress, which this time is nothing less than the old fur cap handed down in Cochin’s portrait of him; and the big bone glasses, too, are upon his nose. In his outstretched hand he carries a palm branch. The ludicrous combination of bare legs, sandals, toga, fur cap, and spectacles is hardly what one would expect from a Frenchman treating so serious a subject. There are two plates of this picture, both the same size, 8 x 12, which would indicate that it was considerably in demand by the many admirers of Voltaire.

“*Mirabeau arrive aux Champs Élysées.*”—This is the title of a plate, 9 x 13, designed by J. M. Moreau and engraved by L. J. Masquelier. The Genius of Liberty, represented by a winged cherub, is floating above Mirabeau, bearing a banner with the inscription “*La France libre*,” Mirabeau advances towards Rousseau and presents him with a “*charte constitutionnelle*.” Genii follow him laden down with his works. Franklin is placing a crown of evergreen oak on his head. Montesquieu, Voltaire, Mably, and Fénelon are coming forward to receive him. In the background Demosthenes and Cicero are conversing about the French orator while they look intently upon him.

The five plates here described,

from the writer’s collection, are the only ones known devoted to the title subject of this article. There is, however, an engraving of Franklin in an oval frame after the portrait ascribed to Madame le Filleul, which, while not strictly coming under our title, yet is so near akin to it that it should be mentioned. Diogenes is leaning over the portrait holding his lantern in the right hand while with the left he points to the portrait of the honest man. Beneath is the inscription, “*Stupete Gentes Reperit vivum Diogenes.*” A large plate, entitled “*L’Apôtre de la Liberté Immortalisé*,” was published after Franklin’s death by one Barincou Monbrun, but it is so absurd as to be little better than a vulgar caricature. It, with most of the others mentioned, can be found in the important collection of Washington and Franklin iconography given to the Metropolitan Museum by the late William H. Huntington of Paris.

The portrait of Franklin which accompanies this article is from the last known to have been painted from life, and seems to express the individuality and character of the man, as shown by his life, more satisfactorily than any other we know. It was done by Charles Willson Peale in Philadelphia during the sittings of the convention to frame a constitution for the United States. Peale’s ability as a portrait painter is very much underestimated, and for the reason that his work is familiar chiefly through his inferior productions, those made for his museum gallery. But any one who saw the examples from his easel in the exhibition of historical portraits in Philadelphia, two years ago, will be very sure to have a marked

THE TOMB OF VOLTAIRE.

respect for the man who painted them. The picture from which our engraving is made is one which will do him no discredit. From this painting he made a mezzotinto with the following inscription: "His Excellency B. Franklin, LL. D., F. R. S., President of Pennsylvania and late Minister of the United States of America at the Court of France. C. W. Peale pinxt. et fecit, 1787." This mezzotinto is exceedingly scarce and valuable, but some impressions doubtless found their way to France, for two of the few located came thence, and a French print in colors by P. M. Alix, published towards the close of the last century and purporting to be after a picture by Vanloo, is evidently a copy, by an awkward and inferior hand, of Peale's picture, and not, as Mr. Hale in his late book thinks, Peale's copy of this French picture. The original painting from which this portrait has been engraved belongs to Mrs. Joseph Harrison of Philadelphia, and a replica of the head, with accessories, hangs

in the hall of the Historical Society of Pennsylvania.

Benjamin Franklin was what is vulgarly called a self-made man, but he was in truth a God-made man, for he was born with the spark of genius in his blood which developed him into the *Vir* he finally became. His strongest characteristic was quick perception, that most valuable quality of mind, that can as readily grasp the salient points of a question as it can disregard those of minor importance, to which in him was united a sound, agile judgment. With all his transcendent abilities he has not left a single monument that alone can be pointed to as proof of his power. His career, stamped as it was with great successes, and left as it has an imperishable mark upon the page of history, is much like the career of a great lawyer whose powers and abilities have contributed largely to build up the body of laws we call government; yet the finger can point to no one great controlling act—his was the rounded whole.

Charles Henry Hart.

MY HOLLYHOCK.

AH me, my scarlet hollyhock,
Whose stately head the breezes rock,
How sad, that in one night of frost
Thy radiant beauty shall be lost,
And all thy glory overthrown
Ere half thy ruby buds have blown!
All day across my window low
Thy flowery stalk sways to and fro
Against a background of blue sea.
On the south wind, to visit thee,
Come airy shapes in sumptuous dyes—
Rich golden, black-edged butterflies,
And humming-birds in emerald coats,
With flecks of fire upon their throats,
That in the sunshine whirl and glance,
And probe the flowers with slender lance;
And many a drunken, drowsy bee,
Singing his song hilariously.
About the garden fluttering yet,
In amber plumage freaked with jet,
The goldfinches charm all the air
With sweet, sad crying everywhere.
To the dry sunflower stalks they cling,
And on the ripened disks they swing,
With delicate delight they feed
On the rich store of milky seed.

Autumn goes loitering through the land,
A torch of fire within her hand.

Soft sleeps the bloomy haze that broods
O'er distant hills and mellowing woods;
Rustle the cornfields far and near,
And nuts are ripe, and pastures sere,
And lovely odors haunt the breeze,
Borne o'er the sea and through the trees.
Belated beauty, lingering still
So near the edge of winter's chill,
The deadly daggers of the cold
Approach thee, and the year grows old.
Is it because I love thee so
Thou waitest, waving to and fro
Thy flowery spike, to gladden me,
Against the background of blue sea?
I wonder—hast thou not some sense,
Some measure of intelligence
Responding to my joy in thee?
Almost I dream that it may be,
Such subtleties are Nature's, hid
Her most well-trodden paths amid;
Such sympathies along her nerves;
Such sweetness in her fine reserves.
Howe'er it be, I thank the powers
That gave me such enchanted hours
This late October, watching thee
Wave thy bright flowers against the sea.

Celia Thaxter.

LAURELS OF THE AMERICAN TAR IN 1812.

NOTES ON AMERICAN SEAMANSHIP AND GUNNERY, THE OVERWEIGHT OF ENGLISH-FRENCH METAL, AND THE UNTRUSTWORTHINESS OF THE ENGLISH REPORT OF THE "SHANNON'S" VICTORY OVER THE "CHESAPEAKE."

IT was during the war of 1812 that the advantage of building our cruisers so that "separately [they] would be superior to any single European frigate of the usual dimensions"¹ was demonstrated. In the three years of that war the British navy met with disasters which were unique in its annals. Before the close of the war the British Admiralty were compelled to build in imitation of the American cruisers. On the 17th of March, 1814, the following notice appeared in the London "Times": "Sir G. Collier was to sail yesterday from Portsmouth for the American station in the *Leander*, 54. This ship has been built and fitted out exactly upon the plan of the large American frigates."

The second idea embodied in the Secretary's report of 1794, in regard to building American cruisers, was "that if assailed by numbers they would be always able to lead ahead." At the very threshold of the war of 1812 the *Constitution* owed her escape from Captain Broke's squadron, in a large degree, to this very forethought in her construction. For three nights and two days, beginning on July 17, off New York, she was in imminent danger of capture, part of which time she was almost within gunshot of their leading ships. To this same

provision in her construction the *President* owed her remarkable career and numerous escapes from British squadrons and ships of the line while she was scouring all corners of the navigable globe in her daring essays against the enemy's commerce. Such was her success in this particular that the origin of the common sea phrase "By the jumping John Rodgers" is attributable to her exploits, Commodore John Rodgers being her commander during the greater part of this war.

Again, in April, 1815, while in the Southern Atlantic the sloop-of-war *Hornet* was chased three days and three nights by the British ship of the line *Cornwallis*, Admiral Sir George Burleton. So close was the pursuit that at times "shot and shell were whistling about our ears and not a person on board had the most distant idea that there was a possibility of escape. We all packed our things and waited until the enemy's shot would compel us to heave to and surrender. Captain Biddle mustered the crew and told them he was pleased with their conduct during the chase, and looked still to perceive that propriety of conduct which had already marked their character and that of the American tar generally; that we might soon expect to be captured, etc. Not a dry eye was to be seen at the mention of the capture of

¹ From the report of the Secretary of War, made April 1, 1794, in which he said that the six frigates authorized by the law of the previous March "separately would be superior to any single European frigate of the usual dimensions; that if assailed by numbers they would be always able to lead ahead; that

they could never be obliged to go into action but on their own terms, except in a calm; and that in heavier weather they would be capable of engaging double-decked ships." These six frigates were the *Constitution*, *President*, *United States*, *Chesapeake*, *Congress*, and *Constellation*.—EDITOR.

THE "CONSTITUTION" CHASED BY CAPTAIN BROKE'S SQUADRON.

The ports on the upper deck aft were roughly cut to meet the emergency. The sailors in the rigging threw water from buckets upon the sails to make them hold better the faint breeze, and below hose pipe was used to the same purpose. During the three days' chase boats were sent out to tow, and kedge anchors were used to warp the ship forward.

the poor little *Hornet*." ¹ But notwithstanding the closeness of the chase the *Hornet* finally effected her escape through her sailing qualities.

In no instance up to the close of the war of 1812 was an American cruiser overtaken by a vessel of her own class when she was desirous of making her escape. The case of the *President* when pursued by Captain Hayes's squad-

ron on the 15th of January, 1815, cannot be noted as an exception, for the reason that while endeavoring to get out of New York harbor, the night before the chase, she grounded on the bar, where for two hours she thumped violently and became so "hogged" or "broken-backed" as to impair seriously her seaworthiness. A portion of her false keel was displaced, several rudder braces broken, and the frigate otherwise so injured as to render a

¹ Private journal of one of the *Hornet's* officers.

return to port imperative. This, however, owing to the strength and direction of the wind, was impossible, so she was forced over the bar and put to sea in a crippled condition. After dismantling the *Endymion*—during which action Commodore Decatur was wounded by a splinter—the *President* was attacked by the *Tenedos* and *Pomona* before her rigging could be repaired, and was forced to surrender.

The American system of officering, manning, and carrying on discipline was superior to that of the English. Impressment was rarely, if ever, resorted to; the men enlisted of their own free will, and tempted by generous wages the finest seamen flocked to our service. Many of the petty officers had been mates and even masters in merchantmen before the war of 1812, and contributed not a little by their skill and experience to the results of that conflict. While English press-gangs were descending on quiet towns, and hurrying men into service without giving them time to arrange their affairs for the change, American frigates were having their complements filled with picked seamen by merely announcing vacancies. The superiority of most American crews during this war was so obvious as to need little discussion. William James concedes the point, and while speaking of the 44-gun frigate *United States* further adds:

The crew of the *United States* were the finest set of men ever seen collected on shipboard. Had Captain

Decatur and his five lieutenants been below in the hold, there were officers enough among the ship's company to have brought the action to the same successful issue.¹

But it was in the matter of officering the ship that the American system had the greatest advantage. Favoritism and family influence, which elevated men to high rank over the heads of older and more deserving officers, cost the British navy many bitter humiliations during the war of 1812. The battle of Lake Champlain affords a good illustration of the manner in which British commanders were outmaneuvered and outwitted. The forces engaged on this occasion were nearly equal, that of the Americans being 86 guns of 1904 pounds of metal and 850 men, while the English force was 92 guns of 1900 pounds of metal and 1000 men. After the battle had lasted two hours without either side being able to turn the tide, Captain Macdonough in the *Saratoga* found himself in a most critical condition. The *Linnet* had secured a very advantageous position off the *Eagle's* starboard quarter where the latter could bring but few guns to bear. Finding his springs shot away, Captain Henly of the *Eagle* sheeted home his topsails, stood about, ran down the western side of the American line, and anchored between the *Saratoga* and *Ticonderoga*. This brought the *Eagle's* fresh (port) broadside in full play on the *Confiance*, Captain

¹ James's "History of the British Navy," Vol. V., p. 401.

HOISTING IN THE "CONSTITUTION'S" BOATS AT THE END OF THE THREE DAYS' CHASE.

Downie's flagship, but it also enabled the *Linnet* to turn the American line. Captain Pring of the *Linnet* immediately availed himself of this advantage and soon was athwart the *Saratoga's* forefoot, raking her from stem to stern with great effect.

As gun after gun was disabled the firing between the flagships gradually diminished until only a few cannon were in use. Aboard the *Saratoga* nearly all the carronades had been rendered useless by overcharging. Now that the *Linnet* was raking her with impunity, the situation of the American flagship was desperate in the extreme. To add to her accumulating disasters the bolt of the last carronade on the engaged side broke; the gun, flying off its carriage, tumbled down the main hatch. This left her with nearly every gun in her starboard battery dismounted, while the *Confiance* and *Linnet* were still keeping up an effective fire.

It was in this extremity, when by all human calculations the day was lost, that the forethought of the American commander came into play. When arranging his line of battle he took the precaution to anchor his vessels far enough apart so that should the starboard battery of any ship become disabled her commander, by tripping his bow anchor and then dropping a stern anchor, could swing his vessel around in the northerly breeze and bring a fresh broadside to bear on the enemy without breaking the line of battle or overlapping the ship astern.

The time had now come when the *Saratoga* must either surrender or bring more guns to bear. Accordingly Captain Macdonough manned his capstan and tripped the bower anchor, at the same time letting go his stream

anchor over the stern. But unfortunately the wind had abated so that the ship remained motionless. A line, which had been made fast to the stream anchor, was then carried forward and hauled on. This slowly brought the vessel around, but during all of this time the *Linnet* was pouring in broadside after broadside, and now as the *Saratoga* exposed her stern the *Confiance* raked her with great effect. After several minutes of this fearful exposure Captain Macdonough succeeded in bringing his port battery into full play. The Americans then rushed to their guns and worked with vigor. Being subjected to the fire of this fresh broadside, the *Confiance* soon had the few remaining guns of her port battery disabled. Seeing the success of the *Saratoga's* manœuvre, the British commander attempted it also. He hove in his bow cables until he tripped anchor. But further than this his ship would not move for want of wind, and lacking the quick expedients of the American officers, he saw his ship become a wreck without being able to strike a blow in return, so after a conflict of two hours and a half he surrendered.

Another conspicuous illustration of the readiness of an American officer was afforded in the fourth cruise of the *Constitution*. Captain Charles Stewart, born of poor parents in the city of Philadelphia in 1778, entered upon the profession of the sea in his thirteenth year as cabin boy in a merchantman, and rose step by step through personal merit to the command of the favorite frigate of the American navy.

After his extraordinary action with the corvette *Cyane* and sloop *Levant* sixty leagues from Madeira in February, 1815 (both after a gallant resistance being captured), Captain

Stewart dropped anchor with his prizes in Port Praya, in the island of St. Jago, on the 10th of March. It was his intention to employ the merchant ship captured on the 18th of the preceding month as a cartel in which to send all prisoners to England, preparatory to which they were collected in groups on the *Constitution's* main deck. While the Americans were busily engaged

the officer of the deck, Lieutenant Shubrick, was attracted by an exclamation from one of the British midshipmen. Noticing that an English lieutenant reprimanded him in an undertone, Lieutenant Shubrick became suspicious of foul play or some conspiracy, and was about to communicate his fears to Captain Stewart, when a quartermaster called his attention to the sails of a large vessel just discernible through the fog in the offing. The sea at the entrance of the harbor was covered with a heavy mist, but in the lighter haze above the sails of a large ship making its way to port were visible.

This apparition, evidently the cause of the midshipman's exclamation, was brought to the attention of Captain Stewart. As the fog shifted a little the sails of two more vessels, apparently heavy men-of-war, were discovered by the sharp-eyed quartermaster standing into the roads. After the experience of the *Essex* at Valparaíso, Captain Stewart well knew that English commanders could not be trusted to respect the rights of neutral ports that were not sufficiently fortified to enforce them. The defenses of Port Praya were impotent against a first-rate frigate, and should the sails descried in the offing prove to be those of English men-of-war, as five chances to one they were, the position of the *Constitution* and her prizes was critical in the extreme.

Captain Stewart instantly sent his crew to
 VOL. XLI.—28.

quarters, prisoners were hurried below, the cables cut, topsails set, and in seven minutes from the time of the first alarm the frigate was under way. Signals were made to the *Cyane* and *Levant* to follow, Lieutenants Hoffman and Ballard precipitately obeyed, and in an incredibly short time the three ships were speeding pell-mell down the harbor. A number of prisoners who had been landed were left behind, and observing the strange sails in the offing and surmising them to be English, they rushed to a battery and began firing so as to warn the approaching strangers of the presence of enemies.

The wind was fresh from the northeast, while the strangers were approaching the harbor from the south. Captain Stewart therefore hugged the north shore, hoping to get to sea to the windward of them. Just as the American vessels were clearing East Point the strangers came within long range. At this instant they discovered the Americans and crowded on all sail to intercept them. It now became a question of sailing. The *Constitution* crossed her topgallant yards, set foresail, mainsail, spanker, flying-jib, and her topgallant sails, while the two boats towing astern were cut adrift. The *Cyane* and *Levant* followed in quick succession, while the enemy luffed up, close-hauled their tacks, and settled down for a long and determined chase.

The strangers proved to be the English 50-

On the right is seen the upper deck gangway carrying carronades.

gun frigate *Leander*, Sir George Collier, which we noticed as having "been built and fitted out exactly upon the plan of the large American frigates"; the 50-gun frigate *Newcastle*, Captain Lord George Stuart; and the 40-gun frigate *Acasta*, Captain Kerr. This powerful squadron had followed the *Constitution* across the Atlantic into this obscure quarter and now had her under their guns.

Although the American vessels had gained an offing it was still so foggy that the hulls of the enemy were concealed, so that Captain Stewart was unable to make out their force or nationality. All the ships, however, had every stitch of canvas set from royal studding-sails down, and were rushing through the water at ten knots. The *Acasta*, by laying her head close to the wind, succeeded in weathering the *Cyane* and *Levant*, but the splendid sailing qualities of the *Constitution* enabled Captain Stewart to hold his own. Observing that he was drawing away from his prizes and that the enemy must soon close on them, he, at ten minutes past one o'clock, signaled the *Cyane*, the sternmost vessel, to tack to the northwest, hoping thereby to divide the enemy's force. Lieutenant Hoffman tacked as ordered, but, to the surprise of all, none of the pursuing ships were detailed after her. Taking advantage of this blunder, the *Cyane* continued on this course until she had run the enemy out of sight, when she made for

America, arriving in New York on the 10th of April.

By 2.30 P. M. the *Newcastle* had gained a position off the *Constitution's* lee quarter and commenced firing by divisions. The shot splashed the water within a hundred yards of the ship, but did not reach her. At 3 P. M. the *Levant* was in the same danger from which the *Cyane* had so strangely been allowed to escape. Captain Stewart now signaled the *Levant* to head northwest also, hoping that this would draw off one of his pursuers at least. But, to the astonishment of every man in the American frigate, all the pursuing ships tacked after the *Levant*, whereupon Lieutenant Ballard changed his course to due west so as to regain the port, where he succeeded in anchoring under the guns of the fort.

The conduct of Sir George Collier in allowing the *Constitution* and her prizes to escape his powerful squadron has given rise to many conflicting explanations on the part of English writers. Some claim that he did not give the order for all the ships to tack after the *Levant*, others that the signal was misinterpreted, while many maintain that the flags became entangled.

It was in gunnery, however, that Americans attained their most conspicuous success. Long before the war of 1812 firing at targets was a regular order of routine, so that it has well been said that for each shot fired in earnest ten had been fired in practice. The "London

Times" for October 22, 1813, while speaking of the action between the *Enterprise* and *Boxer*, said:

What we regret to perceive stated, and trust will be found much exaggerated, is, that the *Boxer* was literally cut to pieces in sails, rigging, spars, and hull; whilst the *Enterprise* (her antagonist) was in a situation to commence a similar action immediately afterwards. The fact seems to be but too clearly established, that the Americans have some superior mode of firing; and we cannot be too anxiously employed in discovering to what circumstances that superiority is owing.

Sir Edward Codrington, in writing to Lady Codrington in reference to the *Peacock-Épervier* fight, states: "It seems that the *Peacock*, American sloop-of-war, has taken our *Épervier*. But the worst part of our story is, that our sloop was cut to pieces and the other scarcely scratched!"

The firing of the 44-gun frigate *United States*, Captain Decatur, during her action on October 25, 1812, with the 38-gun frigate *Macedonian*, Captain Carden, is described as wonderful. "The firing of the American gunners was so rapid that in a few minutes their ship was enveloped in a dense volume of smoke,

illuminated by lurid flashes of lightning and emitting a continuous roar of thunder." When the *Macedonian* came to close quarters with the idea of boarding, "the American carronades opened and added their fire to that of the long guns, so that by the time she was at close quarters the broadside of the *United States* appeared like a continuous line of flame, and at one time the enemy believed her to be on fire."

On the 18th of October, 1812, the American sloop *Wasp*, 18 guns, had a remarkable encounter in a heavy sea with the British sloop *Frolic*, 19 guns. In forty-three minutes the *Wasp* reduced her adversary to a wreck, and killed or wounded 90 out of a crew of 110 men; her own loss in a crew of 135 being only ten. At the end of the engagement the British ship *Poictiers*, 74 guns, hove in sight, and running down on the *Wasp* captured her and her prize.

In an action, of only twenty minutes, between the new sloop *Wasp* (namesake of the foregoing) and the *Reindeer* on June 28, 1814, in the English Channel, we are informed that the hull of the *Reindeer* was literally cut to pieces.¹ Another English writer observes: "In a line with her ports the *Reindeer* was liter-

ally cut to pieces; her upper works, boats, and spare spars were one complete wreck. Her masts were both badly wounded; particularly her foremast, which was left in a tottering

THE "FROLIC" REDUCED TO A WRECK BY THE FIRST "WASP."

state,"¹ and on the following day, in spite of all efforts, it went by the board. Finding his prize too shattered to keep afloat, Captain Blakely blew her up. The *Wasp* received six round shot in her hull, and 24-pound shot through her foremast and some injury to her rigging. Two months after this the *Wasp* had a night action with the *Avon*, also a sloop-of-war of her own rate, the *Wasp* receiving only four round shot in her hull and some inconsiderable injury to her rigging. The fact that the *Avon* sank two hours after the *Wasp* was compelled by the approach of her consorts to leave her plainly shows that she was terribly shattered by the American's gunnery.

The proficiency of American gunnery in this war is perhaps best illustrated by the *Constitution's* first action, with the *Guerrière*, in which she was hulled but three times, while her antagonist, to use the words of her commander, was reduced to a "perfect wreck"² within forty minutes from the time the *Constitution* began to fire. This battle occurred on August 19, 1812. In her action with the *Java*, December 29, 1812, off the coast of Brazil, the *Constitution* was hulled but four times, and with the exception of her maintopsail yard she did not lose a spar.³ The *Java*, on the other hand, was "totally dismasted,"⁴ while her hull was so shattered and pierced with shot-

holes that it was impossible to get her to the harbor of San Salvador, which was only a few hours' sail. In her action with the *Cyane* and *Levant* the forces opposed were: *Constitution*, 51 guns with 1287 pounds of metal; British, 55 guns with 1508 pounds of metal. In this extraordinary action the *Constitution* was hulled only thirteen times, while the *Cyane* had every brace and bow-line cut away, "her main and mizzen masts left in a tottering state, and other principal spars wounded, several shot in the hull, nine or ten between wind and water."⁵ The *Levant* also was roughly handled.

Before dismissing the subject of gunnery we should take into consideration: 1. The inferior quality of American cannon and shot. 2. The deficiency in weight of American shot. 3. The fact that in two of the four actions between single frigates the English used French cannon and shot, which were eight per cent. heavier than their nominal English equivalents.

The first of these considerations has been mentioned in a general way, while the second, the deficiency in weight of American metal, has been touched upon by Cooper in an appendix to his "Naval History," but he has not brought it into the discussion of the battles. The third consideration, that of the use of French cannon and shot in at least two of the frigate actions, seems to have been overlooked.

¹ James's "History of the British Navy," Vol. VI., p. 163.

² Official report of Captain Daclès.

⁴ Allen's "Battles of the British Navy," Vol. II., p. 414.

⁵ James's "History of the British Navy," Vol. VI., p. 249.

As to the first of these points we have indisputable testimony from both American and English sources. In some instances, owing to imperfect casting, shot flew to pieces even before reaching the mark. In a private letter published in a London paper of the year 1812, written by an officer in the British 36-gun frigate *Belvidera*, Captain Richard Byron, which was chased June 22, 1812, by Commodore Rodgers's squadron, we have proof of the inferiority of American shot as used in that chase. Speaking of one of the shot that came aboard the *Belvidera* from the *President* he says: "This shot being of bad quality, it split into about fifty pieces." The cannon also were dangerously defective. In chasing the *Belvidera*, the *President* lost sixteen men by the bursting of her bow chaser and only six from the enemy's fire. This catastrophe so disconcerted her crew that the remaining bow chaser was not used for some time after. In the action between the new 44-gun frigate *Guerrière* and the Algerine frigate *Mashouda* in 1816, one of the guns in the former burst, killing or wounding seven men. In arriving at an equitable comparison of the forces engaged in the war of 1812, therefore, this inferior quality of American cannon and shot must be constantly kept in mind.

In regard to the underweight of American shot, an English historian finds it "not worth inquiring whether or not this alleged trifling variation in weight between American and British shot does exist,"¹ though no point in favor of the other side is too infinitesimal for his consideration.

Owing to the primitive condition of American manufactures this discrepancy in the nominal weight of shot is exceedingly probable, and needs only the confirmation of a few specific instances for proof. In the action between the American sloop-of-war *Wasp* and the British sloop *Avon*, Captain Blakely officially reported to the Secretary of the Navy that "the four shot which struck [us] are all thirty-two pounds in weight, being a pound and three-quarters heavier than any belonging to this vessel." Cooper records that an American officer, after the engagement between the *Constitution* and *Guerrière*, actually weighed the shot of both frigates and found that the *Constitution's* 24-pound shot weighed but 22½ pounds; and in the appendix to his "Naval History" he says:

In the course of the war I personally weighed a quantity of shot, both English and American, and made a note of the result. It was found that the old shot, or those with which the ships were supplied at the commencement of the war of 1812,

were comparatively lighter than those which had been cast at a later day; but in no instance was an American shot even then [that is, at the close of the war] found of full weight. On the other hand, the English shot were uniformly of accurate weight. Some of the American 32-pound shot weighed thirty pounds. The average of the 18-pound shot was about seventeen pounds; but it was understood, as this examination occurred several years after the peace, that the shot, as well as the guns, were then materially better than they had been previously to and during the war.

Theodore Roosevelt, in his "Naval War of 1812," states that the deficiency in weight averaged seven per cent. Thus a 32-pound shot weighed about thirty pounds, a 24-pound shot but 22½ pounds, and so on throughout all the grades of metal.

The importance of the third point, that in two of the four actions between single frigates the English used French cannon and shot, lies in the fact that a French 12-pound shot weighed thirteen pounds in English measurement, a French 18-pound shot weighed 19½ English pounds, and a French 24-pound shot twenty-six English pounds. In the action between the *Constitution* and *Guerrière*, and again between the *Constitution* and *Java*, the Americans were opposed to French-built frigates retaining their French guns and shot. The *Guerrière* was captured in 1806 by H. B. M. ship *Blanche*, and "on being transferred to the British navy became a valuable acquisition to the class of large thirty-eights."² The *Java*, formerly the *Renommée*, was captured from the French in the latter part of February, 1811.

During the thirty-four years prior to the close of this war, 1780-1814, the English had captured between one hundred and fifty to two hundred French vessels of war whose armaments aggregated from six thousand to eight thousand cannon, together with hundreds of thousands of very valuable shot. It is not reasonable to suppose that, when so many captured French vessels of war were taken into the British navy, this great quantity of expensive cannon was thrown aside for old iron. On the contrary, it is more than probable that the French cannon were retained in the ships in which they were captured, and which had been built expressly to accommodate these bulky engines of death.

It is still more probable that these captured French ships were supplied solely with captured French shot, for a 13-pound shot (French twelve pounds) was not cast to fit a 12-pound muzzle nor a 26-pound shot to fit a 24-pound muzzle, and so on throughout the list. Although it is quite possible to fire a 12-pound shot from

¹ James's "Naval Occurrences between the United States and Great Britain," p. 10.

² James's "History of the British Navy," Vol. IV., p. 162.

THE "GUERRIÈRE" IN THE TROUGH OF THE SEA.

a 13-pound gun, and a 24-pound shot from a 26-pound bore, yet it cannot be presumed that the Admiralty supplied their frigates mounting 26-pound cannon with 24-pound shot when they had an enormous quantity of 26-pound shot cast expressly for their 26-pound guns; especially when they could not use this captured shot for English cannon.

In several instances James, as well as other English writers, speaks of the French cannon carried by English commanders, although not in connection with the actions mentioned above.

In the case of the *Constitution* and *Guerrière*, Mr. Cooper informs us in a note¹ — with no reference to the employment of French cannon in English ships, however — that an "officer of the *Constitution*, of experience and great respectability, who is now dead, assured the writer that he actually weighed the shot of both ships, and found that the *Constitution's* twenty-fours were only three pounds heavier than the *Guerrière's* eighteens, and that there was nearly the same difference in favor of the latter's thirty-twos." If the *Guerrière's* "eighteens" were English 18-pounders, this would make a deficiency of three pounds, or fourteen per cent., in the *Constitution's* shot, or just twice as much as was claimed to exist under any circumstances or was ever found to exist.

¹ Cooper's "United States Naval History," Vol. II., p. 58.

These irreconcilable discrepancies in figures can only be explained by calculating the *Guerrière's* eighteens as French eighteens, which makes everything clear. Her 18-pound shot weighed $19\frac{1}{2}$ English pounds, which was the scale used by the officer in question. He found the *Constitution's* twenty-fours were only "three pounds heavier," which would bring her shot down, not to twenty-one pounds, as would have been the case had the *Guerrière's* 18-pounders been English, but to $22\frac{1}{2}$ pounds, which, allowing for the discrepancy of seven per cent, that was found to exist in American metal, would be in strict keeping with all the figures given. There can be no doubt then, from the above evidence, that the *Guerrière* on the occasion of her engagement with the *Constitution* carried her original French armament and shot.

With the above conditions kept in view, namely, the inferior quality of American castings, the deficiency in weight of their shot, and the superior weight of French guns, we have a far more intelligent understanding of these two actions of the *Constitution* and the other engagements of this war.

In accounting for their naval disasters of 1812-15, English historians rightly state that in the first three frigate actions the Americans carried heavier metal; that where the English ship was armed with 18-pounders on the main deck the American carried 24-pound-

ers, and where the Englishman had 32-pounders on the fore-castle and quarter-deck the American had 42-pounders. But it was just this heavy metal which the English commanders declared would detract from the frigate's efficiency. British naval experts insisted that 24 and 42 pounders were too heavy. Experience had taught them that 18 and 32 pound calibers were the medium weights from which the highest possible effectiveness could be derived, and when 24 and 42 pounders were introduced in American frigates they pronounced them innovations, contrary to all established rules, highly characteristic of American assurance, and bound to end in disaster.

During the several years preceding the declaration of war American and British officers frequently interchanged visits, in which the heavy calibers of American frigates were criticized. Captain Carden of the *Macedonian*, whose exceptional delicacy in carrying out the inimical instructions of his government against American merchantmen had placed him on an intimate footing with American officers, often met Decatur in the *United States*, and on one of these occasions, while at the latter's table, "particularly pointed out the inefficiency of the 24-pounders on the main deck of the *United States*; he said that they could not be handled with ease and rapidity in battle, and that long eighteens would do as much execution, and were as heavy as experience had proved a frigate ought to carry. 'Besides, Decatur,' said Carden, 'though your ships may be good enough, and you are a clever set of fellows, what practice have you had in war? There is the rub!'"¹ That Captain Carden held to the opinion that 18 and 32 pounders were superior to 24 and 42 pounders in point of effectiveness, long after his ship had been captured by the *United States*, is seen both in his official report of that action and in his address before his court-martial.

Such, then, was the opinion in reference to 24 and 42 pounders among British officers and naval experts before the war. After the war, however, they raise the cry of "heavier metal," "superior calibers," "it could never have been otherwise," "result of sheer superiority of the American frigate," etc., though this was not, as a rule, the cry raised by the English commanders involved in these actions.

In order to test the relative value of ships, as ships, let us suppose that in the fight between the *United States* and *Macedonian* the two crews and their officers had exchanged frigates: 1 — then we should have Captain Decatur, according to James, in "one of the finest frigates in the British Navy"; 2 — with "the finest set

of men ever seen collected on shipboard"; 3 — his ship carrying precisely the same number of long range guns as his opponent and of a caliber, according to English views and experience, more effective than that carried by his enemy; 4 — he has the all-important weather gage; 5 — his frigate has the "superiority of sailing," which together with the weather gage would enable him to keep at long range where he knew he had the advantage. It is very evident, then, that it is not so much a question of ships.

Although American frigates in point of effectiveness were superior to those of the English, yet I am persuaded that their victories were due not so much to the vessels as to the men who manœvered and fought them. We have just seen in our supposititious exchange of frigates that Captain Decatur's position was bettered twofold by his command of the *Macedonian*. Yet, as it was, he gained a hard-fought battle with a marvelously small amount of damage to his own ship, while that of his antagonist could not have been more expeditiously wrecked had she for the same length of time been opposed by a ship of the line.

This action and the engagements between the *Constitution* and *Guerrière* and the *Constitution* and *Java* stand unsurpassed for the wonderful difference in damage sustained by two frigates that mutually sought an engagement. I would not for a moment suggest that the British tar, in all these actions, did not fully maintain his well-deserved reputation for pluck. Captains Dacres, Carden, and Lambert and their several crews fought with a persevering heroism which must call forth eulogies from friend and foe alike. But the time had arrived when pluck was not sufficient. Naval warfare had reached that stage of development where brute strength and animal courage had become secondary considerations. Success now depended more on the higher discipline of the men, better training at the guns, the intelligent use of improved weapons, the skillful manipulations of the sails, and the thousand and one little improvements in, about, and all over a ship, which only a cultivated intellect would suggest. The superiority of American gunnery and seamanship of this war, their better arrangement and construction of their frigates, have been shown in this paper. These improvements, together with that indomitable pluck and quick perception which have ever characterized the American seaman, overwhelmed the British navy with disaster and consternation. This was the mainspring of our brilliant successes, and it was just in this particular, namely, the supremacy of the mind over matter, that our naval officers achieved their highest triumph.

¹ Mackenzie's "Life of Decatur," p. 157.

THE "SHANNON'S" CREW BOARDING THE "CHESAPEAKE."

It will prove a matter of interest, at this late day, to observe with what effect the news of the first three frigate actions with the United States was received in England. The capture of their first frigate, the *Guerrière*, was taken with philosophical surprise. The news of the loss of the *Macedonian* was discredited at first in London, and the "Times" for December 26, 1812, says:

There is a report that another English frigate, the *Macedonian*, has been captured by an American. We shall certainly be very backward in believing a second recurrence of such a national disgrace. . . . We have heard that the statement is discredited at the Admiralty; but we know not on what precise grounds. Certainly there was a time when it would not have been believed that the American navy could have appeared upon the seas after six months' war with England; much less that it could, within

that period, have been twice victorious: *sed tempora mutantur*.

The news of the loss of the *Java*, which arrived in London, March 19, 1813, seems to have drawn the following resigned soliloquy from the "Times":

The public will learn with sentiments which we shall not presume to anticipate that a third British frigate has struck to an American. . . . This is an occurrence that calls for serious reflection — this and the fact stated in our paper of yesterday, that Lloyd's list contains notices of upwards of five hundred British vessels captured, in seven months, by the Americans. Five hundred merchantmen, and three frigates? Can these statements be true; and can the English people bear them unmoved? Any one who had predicted such a result of an American war this time last year would have been treated as a madman or a traitor. He would have been

told, if his opponents had condescended to argue with him, that long ere seven months had elapsed the American flag would be swept from the seas, the contemptible navy of the United States annihilated, and their maritime arsenals rendered a heap of ruins. Yet down to this moment not a single American frigate has struck her flag.

There has been a disposition among English writers to point to the action between the *Chesapeake* and *Shannon* as the one instance in which an American and English frigate met on equal terms, both equally prepared for battle and meeting in response to a challenge to single combat. A close investigation of the condition of the two frigates, however, will show that they met on very unequal terms, and not in response to a challenge to single combat.

Landing in New York in the latter part of March, 1813, after his brilliant victory in the *Hornet* over the *Peacock* on February 24, Captain Lawrence was received with great enthusiasm. Previous to his return he had been promoted to the rank of post captain and was now offered the command of the frigate *Constitution*, on the condition, however, that neither Captain Porter nor Captain Evans applied for her. This conditional offer, being distasteful to Lawrence, was declined, upon which the Secretary of the Navy gave him the unconditional command of that favorite ship. A few weeks after, however, Captain Lawrence was surprised by counter orders with instructions to repair immediately to Boston and take command of the *Chesapeake*, then nearly ready for sea.

From the time of her ignominious surrender to the *Leopard* in 1806, the *Chesapeake* had been stigmatized as an "unlucky ship."

After cruising among the West Indies for four months without success, Captain Evans headed the *Chesapeake* for the north, arriving at Boston on the 18th of April, 1813. While entering the harbor she lost a topmast, the men on it at the time being drowned. This accident was regarded among the sailors as an inauspicious omen for the next cruise, which, together with her previous reputation for bad luck and a tar's dread for such ships, rendered it exceedingly difficult to enlist another crew. The men made haste to leave, while her officers found employment in other vessels. Captain Evans, having lost the sight of one eye and being in imminent danger of losing that of the other, was granted a furlough while undergoing medical treatment.

Such was the condition of the *Chesapeake* after her last unsuccessful cruise. In the following letter to Captain Biddle of the *Wasp* Captain Lawrence shows a very evident disinclination to accept the command of the *Chesapeake*:

BOSTON, May 27, 1813.

DEAR SIR: In hopes of being relieved by Captain Stewart, I neglected writing agreeably to promise; but as I have given over all hopes of seeing him, and the *Chesapeake* is almost ready, I shall sail on Sunday, provided I have a chance of getting out clear of the *Shannon* and *Tenedos*, who are on the lookout. My intention is to pass out by Cape Sable, then run out west [east?] until I get into the stream, then haul in for the Cape Canso and run for Cape Breton, where I expect the pleasure of seeing you; I think your best chance of getting out is through the Sound. In haste, yours sincerely,

CAPTAIN BIDDLE.

JAMES LAWRENCE.

So strong was this aversion for the *Chesapeake* that we have it upon the authority of Washington Irving that Lawrence even requested to be retained in command of the sloop-of-war *Hornet* rather than accept the command of the frigate *Chesapeake*. He wrote "four letters successively to the Secretary" requesting some change in his last instructions, but receiving no answer he was constrained to obey.

Arriving in Boston, Captain Lawrence found the *Chesapeake* nearly ready for sea, wanting only an adequate complement. She had been provisioned for a long cruise to the northwest with a view of breaking up the enemy's whale fisheries off the coast of Greenland. On the morning of June 1, while the *Chesapeake* was at anchor in President Roads, the British 38-gun frigate *Shannon*, Captain Broke, appeared in the offing and by her manœuvres seemed to invite the American to come out and engage. Captain Lawrence had arrived in Boston but a few days before and was unacquainted with his officers, men, or ship. The first lieutenant, O. A. Page, an officer of experience, was confined on shore by a serious illness of which he soon after died. His place was supplied by Lieutenant Ludlow of the marines, who, though an officer of merit, was "scarcely twenty-one years of age,"¹ and was in a strange position where experience was indispensable. The second lieutenant, Mr. Budd, was the only commissioned sea officer of experience in the ship. The positions of third and fourth lieutenants were also vacant and were filled by Midshipmen Cox and Ballard, who now served in these capacities for the first time. This most unfortunate inexperience among the lieutenants, even with a well-trained crew, would have much embarrassed the working and fighting of a frigate. But it will be interesting to discover what kind of men these young officers had to manage.

The *Chesapeake's* crew, as finally brought together, was composed in a large measure of landsmen, foreigners,—the boatswain's

¹ Ludlow's monument, Trinity churchyard, New York City.

mate being a Portuguese,—and the least desirable sailors in port, the better seamen naturally preferring a better ship. So ignorant were the officers of the *Chesapeake* of their own men that one of her lieutenants joined a party of British boarders supposing them to be Americans. The ship's company had not been together on blue water a single day. The captain, just arrived, took charge of a strange ship with a green crew, with only one lieutenant who had ever served in that capacity before, while the crew was largely composed of landsmen who did not know the mainbrace from a marlinspike. Besides all this there was the by no means fanciful disadvantage of an "unlucky ship."

Such being the condition of the *Chesapeake* it is surprising that Captain Lawrence did not postpone the meeting until he could bring his men under better training. It afterwards appeared that Captain Broke had sent a written challenge to Lawrence, requesting the latter to select some time and place "at any bearing and distance you please to fix off the south breakers of Nantucket, or the shoal of St. George's Banks, so that the two frigates might engage in single action, both equally prepared." This challenge did not arrive in Boston until after the *Chesapeake's* departure;¹ so when Captain Lawrence observed the British frigate in the offing apparently daring him to give battle he understood it as a challenge to immediate action, and, obeying the impulse of a brave but impetuous nature, he made sail to engage. The *Chesapeake* went out to meet the *Shannon*, not prepared for single combat, not in response to Captain Broke's challenge, but as if the two vessels had met casually before the harbor.

We will now turn to English records and investigate the condition of the *Shannon* and the causes which led Captain Broke so earnestly to desire an action with the *Chesapeake*. According to Mr. Young, the naval historian, "From the time that Captain Broke took command of her [the *Shannon*] he had carefully trained her crew in gunnery and in every other exercise calculated to make them really efficient in the day of trial." Turning to other records, we find that Captain Broke assumed command of the *Shannon* on the 14th of September, 1806, so that up to this date he had commanded her over six years, and developed her efficiency in speed and in battle.

It further appears that Captain Broke had not only been in continuous command of the *Shannon* over six years, but that his present crew had served under him five years, for Mr. Allen informs us that "The crew of the *Shannon* had been five years together commanded

by the same captain." So we find that Captain Broke was thoroughly acquainted with his crew. That he had trained them to the highest possible degree of efficiency, and that he was regarded as an unusually able disciplinarian for the British navy of that period, is seen in the following from Mr. James:

Previously to our dismissing the action of the *Shannon* and *Chesapeake* we shall confer a service on the profession by stating as much as we know of the means taken by Captain Broke to endow his men with that proficiency the effects of which were so decisive and astonishing. Every day for about an hour and a half in the forenoon, when not prevented by chase or the state of the weather, the men were exercised at training the guns, and for the same time in the afternoon in the use of the broadsword, pike, musket, etc. Twice a week the crew fired at targets, both with the great guns and musketry, and Captain Broke, as an additional stimulus beyond the emulation excited, gave a pound of tobacco to every man that put a shot through the bull's-eye.

Captain Brenton in his "Naval History of Great Britain" says: "The British navy, depressed by repeated mortifications, had in some measure lost its spirits, and the dissatisfaction expressed in the public journals of the empire produced a feeling of discontent and disgust in the bosom of our seamen." During the eighteen years preceding the war of 1812 the British navy had matched its strength against the strongest marine powers of the world, and in some one hundred and fifty actions between single ships it was defeated but five times, and on those five occasions the British vessel was inferior in force to her antagonist. But in the short space of six months this same navy had suffered five consecutive defeats, in one of which its vessel was acknowledged to be of superior force, and had gained not one corresponding success! And this too from what the "London Times" called "the contemptible navy of the United States."

Thus it was that the *Shannon*, the best frigate on the North American station, appeared before Boston harbor with a perfect crew, augmented by seamen taken from a recaptured merchantman, and burning with a desire to avenge these "repeated mortifications" and in some degree mitigate the humiliation of their recent disasters. Mr. James virtually admits that the *Shannon* on this occasion had been so thoroughly prepared for battle as to be nearly or quite able to give battle successfully to the *Constitution*—it being borne in mind that the *Constitution* was a much heavier frigate than the *Chesapeake*, one rating as a 44-gun and the other as a 36-gun ship.

Even while the *Chesapeake* was sailing out

¹ Washington Irving.

of Boston harbor Captain Lawrence had a foretaste of the quality of his crew. Having cleared the land he called them together and gave them a short harangue. In the midst of his speech he was interrupted by their loud murmurs and mutinous attitude.¹ When allowed to finish his remarks "a scoundrel Portuguese, who was boatswain's mate,"² spoke up and demanded in an insolent manner prize money which had been due to some of the crew for several weeks past. Here was an awakening for Captain Lawrence! An enemy in the poor quality and dangerous disposition of his crew, and a powerful foe awaiting his oncoming.

Sir Provo Wallis, senior admiral of the British navy, and in 1813 second lieutenant of the *Shannon*, describes the approach of the frigate as a beautiful sight. He says "Lawrence displayed great skill and tactics when closing with us, to prevent our fire, which, however, we did not attempt, for Broke had given orders not to fire whilst the gallant fellow keeps his head towards us."³ Just before the action opened Sir Provo handed his watch to a seaman who was stationed below decks in the magazine, remarking, "You will be safe; should anything happen to me, give this to my father." By this watch the seaman timed the firing, and "by it we know the cannonading lasted for only eleven minutes."⁴

The *Chesapeake's* armament as given by Sir Provo Wallis, who took command of her immediately upon her surrender and remained in her for a week after, was: "Main deck, 28 long 18-pounders; quarter-deck, 16 short 32-pounders; forecastle, 4 short 32-pounders and 1 long 18-pounder — 49 guns in all";⁵ giving a total weight, when allowing for deficiency in weight in American shot, of 1081 pounds. Out of her complement of 340 she lost 47 killed and 99 wounded, making in all 146.⁶ The fact which reflects most credit is that the loss in the *Chesapeake* was confined to the American portion of the crew, the foreigners skulking about the ship, seeking to escape their own officers as well as the enemy. The *Chesapeake* was not surrendered until every officer in the ship was either killed or wounded.

The *Shannon*, according to English accounts, carried 28 long 18-pounders, 4 long 9-pounders, 1 long 6-pounder, 16 short 32-pounders, and 3 short 12-pounders; in all 52 guns with 1094 pounds of metal. Her com-

plement is given at 330, out of which she lost 23 killed and 56 wounded; total, 79.

COMPARATIVE FORCE AND LOSS.

	Guns.	Lbs.	Crew.	Killed.	Wounded.	Total.
Chesapeake.....	49	1081	340	47	99	146
Shannon.....	52	1094	330	23	56	79
						Time, 15 m.

In connection with this battle Mr. James makes this statement: "Out of a crew including eight recaptured seamen and twenty-two Irish laborers, two days in the ship," Captain Broke increased his force, etc. The impression derived from this wording is that twenty-two out of the thirty men taken into the *Shannon* just before the action were landsmen, more in the way than of use. Inquiring of Admiral Wallis in reference to this point the writer was authorized to state that "the 'twenty-two Irish laborers' on board the *Shannon* were a part of the thirty as stated in Broke's challenge to Lawrence," where they are distinctly described as "thirty seamen, boys, and passengers."

The *Chesapeake* and *Shannon*, as compilations of wood, iron, and guns, were as equally matched as any two frigates possibly could be. In point of preparation, however, which is of vital importance, the *Shannon* had an overwhelming superiority, as seen in the results. Had the *Chesapeake* been a 44-gun frigate, or even a 60-gun razee, and had come into this action under the same conditions, the issue hardly could have been different.

It has frequently been stated by students of history, and inscribed by at least one historian, that it was doubtful if Captain Lawrence ever gave expression to the words, "Don't give up the ship." In reference to this point the writer was authorized by Sir Provo Wallis to publish the following statement: "We [officers of the *Shannon*] heard that when they were carrying Captain Lawrence below, mortally wounded, he uttered the words, 'Don't give up the ship.'" It hardly seems possible that such a myth could be started during the great excitement of battle and the confusion consequent on its termination and immediately after have reached the ears of the British officers.

Furthermore an officer of the *Chesapeake*, writing in a private letter of the voyage of the two ships from Boston to Halifax after the battle, remarks: "Captain Broke and Captain Lawrence were both delirious from their wounds. . . . When Captain Lawrence could speak, he would say, 'Don't give up the ship.'" This clearly shows that these words were strongly impressed upon his mind when he received his mortal wound.

Perhaps no naval encounter of this war called from contemporary writers and newspapers on both sides of the Atlantic so much

⁶ Official report of Lieutenant Budd.

misrepresentation and exaggeration as the battle between the *Chesapeake* and *Shannon*. The Americans were filled with the profoundest gloom and an unreasonable loss of confidence in their navy, while the English gave vent to most extravagant rejoicings; simply because an English frigate had captured an American of the same force. The published official report of Captain Broke contains the following episode: "Mr. Smyth, who commanded in our foretop, stormed the enemy's foretop from the foreyard arm, and destroyed all the Americans remaining in it." Sir Provo Wallis, however, who was present on that occasion, gives a somewhat different rendering. The "storming" he flatly contradicts. "It was mere invention 'Smith's having stormed her foretop'; but he did board her from our foreyard and slid down on one of her backstays." The same published official report observes: "The Lieutenants Johns and Law, of the marines, bravely boarded at the head of their respective divisions." To this Sir Provo replies: "Neither did the officers of the marines board, for when I took command of the quarter-deck I found them there." The report furthermore goes on to say: "Both ships came out of the action in the most beautiful order, their rigging appearing as perfect as if they had been only exchanging a salute." Admiral Wallis thought otherwise, for he says: "It was equally erroneous to say that the ships came out of action as perfect as if they had been only exchanging a salute; the fact being that our lower rigging was all cut through, and the masts, consequently, unsupported, so that had any sea been on they would have gone over the side." Finally, the report states: "I [Broke] was only capable of giving command till assured our conquest was complete; and then directing Second Lieutenant Wallis to take charge of the *Shannon* and secure the prisoners, I left the third lieutenant, Mr. Falkner (who had headed the main-deck boarders), in charge of the prize." In reference to this Admiral Wallis states: "Finally, the story of Broke having given me the orders to take charge of the *Shannon*, and Falkner the *Chesapeake*, was fabulous."

The English official report as published is dated "*Shannon*, Halifax, June 6, 1813," and is signed "P. B. V. Broke." The following medical certificate, however, proves that Captain Broke on the 6th of June, 1813, and for

six days before and several weeks after, was absolutely unable "to dictate or write" any account of the action whatever.

These are to certify that I, the undersigned, David Rowlands, M. D., F. R. S., late surgeon of H. B. M. Naval Hospital at Halifax, in Nova Scotia, was there when H. M. S. *Shannon* arrived with her prize, the American frigate *Chesapeake*, on Sunday, the 6th of June, 1813. The former was commanded by the present Captain Wallis, owing to the dreadful wound which Captain Broke had received in the action with the enemy a few days previous. On the 7th of June I was requested by Mr. Alexander Jack, the surgeon of the *Shannon*, to visit Captain Broke, confined to bed at the Commissioner's house in the dockyard, and found him in a very weak state, with an extensive saber wound on the side of the head, the brain exposed to view for three inches or more; he was unable to converse, save in monosyllables, and, I am sure, totally unable to dictate or write an account of the action for some time afterwards, owing to his severe wounds, loss of blood, and the shock his whole frame must have experienced by the blow on the head. . . . I grant this certificate to Captain Wallis, being called to do so by the death of Mr. Jack, the surgeon.

[Signed]

D. ROWLANDS, M. D.

Thus it appears that this published official report signed "P. B. V. Broke" was neither dictated nor authorized by that gallant officer, but was "a concoction of Commissioner Woodhouse and Captains Capel and Byron." Even had the gentleman who drew up the letter submitted it to the inspection of those personally engaged in the battle, said Admiral Wallis, "I would have corrected the errors."

It is such a disclosure as this that justifies American historians in hesitating to accept the official reports of the British commanders, as given to the public, as accurate copies of the originals when these originals are so jealously withheld from the scrutiny of impartial eyes; especially when English historians themselves repeatedly depart from the figures given in these published reports. The writer made every endeavor and brought every influence to bear in order personally to inspect and copy the original reports of all British commanders concerned in the war of 1812. But all to no purpose, the answer being, "Their Lordships express to you their regret at not being able to comply with this request, as the regulations in force preclude all public inspection of Admiralty records after the year 1800."

Edgar S. Maclay.

THE CYNICAL MISS CATHERWRIGHT.

MISS CATHERWRIGHT'S collection of orders and decorations and medals was her chief offense in the eyes of those of her dear friends who thought her clever but cynical.

All of them were willing to admit that she was clever, but some of them said she was clever only to be unkind.

Young Van Bibber had said that if Miss Catherwaight did not like dances and days and teas she had only to stop going to them instead of making unpleasant remarks about those who did. So many people repeated this that young Van Bibber believed finally that he had said something good, and was somewhat pleased in consequence, as he was not much given to that sort of thing.

Mrs. Catherwaight, while she was alive, lived solely for society, and, so some people said, not only lived but died for it. She certainly did go about a great deal, and she used to carry her husband away from his library every night of every season and left him standing in the doorways of drawing-rooms, outwardly courteous and distinguished looking, but inwardly somnolent and unhappy. She was a born and trained social leader, and her daughter's coming out was to have been the greatest effort of her life. She regarded it as an event in the dear child's lifetime second only in importance to her birth; equally important with her probable marriage, and of much more poignant interest than her possible death. But the great effort proved too much for the mother, and she died, fondly remembered by her peers and tenderly referred to by a great many people who could not even show a card for her Thursdays. Her husband and her daughter were not going out, of necessity, for more than a year after her death, and then felt no inclination to begin over again, but lived very much together and showed themselves only occasionally.

They entertained, though, a great deal in the way of dinners, and an invitation to one of these dinners soon became a diploma for intellectual as well as social qualifications of a very high order.

One was always sure of meeting some one of consideration there, which was pleasant in itself, and also rendered it easy to let one's friends know where one had been dining. It

sounded so flat to boast abruptly, "I dined at the Catherwights' last night"; while it seemed only natural to remark, "That reminds me of a story that novelist, what 's his name, told at Mr. Catherwaight's," or "That English chap, who 's been in Africa, was at the Catherwights' the other night, and told me —"

After one of these dinners people always asked to be allowed to look over Miss Catherwaight's collection, of which — almost everybody had heard. It consisted of over a hundred medals and decorations which Miss Catherwaight had purchased while on the long tours she made with her father in all parts of the world. Each of them had been given as a reward for some public service; as a recognition of some virtue of the highest order — for personal bravery, for statesmanship, for great genius in the arts; and each had been pawned by the recipient or sold outright. Miss Catherwaight referred to them as her collection of dishonored honors, and called them variously her Orders of the Knights of the Almighty Dollar, pledges to patriotism and the pawnshops, and honors at second hand.

It was her particular fad to get as many of these together as she could and to know the story of each. The less creditable the story the more highly she valued the medal. People might think it was not a pretty hobby for a young girl, but they could not help smiling at the stories and at the scorn with which she told them.

"These," she would say, "are crosses of the Legion of Honor; they are of the lowest degree, that of chevalier. I keep them in this cigar box to show how cheaply I got them and how cheaply I hold them. I think you can get them here in New York for six dollars; they cost more than that, about forty francs, in Paris. At second-hand, of course. The French government can imprison you, you know, for ten years, if you wear one without the right to do so, but they have no punishment for those who choose to part with them for a mess of pottage.

"All these," she would run on, "are English war medals. See, on this one is 'Tel-el-Kebir,' 'Assosan,' and 'Aboul-Keala.' He was quite a veteran, was he not? Well, he sold this to a dealer on Wardour street, London, for five and six. You can get any number of them on the Bowery for their weight in sil-

ver. I tried very hard to get a Victoria Cross when I was in England, and I only succeeded in getting this one after a great deal of trouble. They value the cross so highly, you know, that it is the only other decoration in the case which holds the Order of the Garter in the Jewel Room at the Tower. It is made of copper so that its intrinsic value won't have any weight with the man who gets it, but I bought this nevertheless for one pound six. The soldier to whom it belonged had loaded and fired a cannon all alone when the rest of the men about the battery had run away. He was captured by the enemy, but retaken immediately afterward by reinforcements from his own side, and the general in command recommended him to the Queen for decoration. He sold his cross to the proprietor of a curiosity shop and drank himself to death. I felt rather meanly about keeping it and hunted up his widow to return it to her, but she said I could have it for a pound.

"This gold medal was given, as you see, to 'Hiram J. Stillman, of the sloop *Annie Barker*, for saving the crew of the steamship *Olivia*, June 18, 1888,' by the President of the United States and both Houses of Congress. I found it on Baxter street in a pawnshop. The gallant Hiram J. had pawned it for sixteen dollars and never came back to claim it."

"But, Miss Catherwaight," some optimist would object, "these men undoubtedly did do something brave and noble once. You can't get back of that; and they did n't do it for a medal either, but because it was their duty. And so the medal meant nothing to them: their conscience told them they had done the right thing; they did n't need a stamped coin to remind them of it, or of their wounds either, perhaps."

"Quite right; that's quite true," Miss Catherwaight would say. "But how about this? Look at this gold medal with the diamonds: 'Presented to Colonel James F. Placerl by the men of his regiment in camp before Richmond.' Every soldier in the regiment gave something towards that, and yet the brave gentleman put it up at a game of poker one night, and the officer who won it sold it to the man who gave it to me. Can you defend that?"

Miss Catherwaight was well known to the proprietors of the pawnshops and loan offices on the Bowery and Park Row. They learned to look for her once a month, and saved what medals they received for her and tried to learn their stories from the people who pawned them, or else invented some story which they hoped would answer just as well.

Though her brougham produced a sensation in the unfashionable streets into which she directed it, she was never annoyed. Her maid went with her into the shops, and one of

the grooms always stood at the door within call, to the intense delight of the neighborhood. And one day she found what, from her point of view, was a perfect gem. It was a poor, cheap-looking, tarnished silver medal, a half-dollar once, undoubtedly, beaten out roughly into the shape of a heart and engraved in script by the jeweler of some country town. On one side were two clasped hands with a wreath around them, and on the reverse was this inscription: "From Henry Burgoyne to his beloved friend Lewis L. Lockwood"; and below, "Through all prosperity and adversity." That was all. And here it was among razors and pistols and family Bibles in a pawnbroker's window. What a story there was in that! These two boy friends, and their boyish friendship that was to withstand adversity and prosperity, and all that remained of it was this inscription to its memory like the wording on a tomb!

"He could n't have got so much on it any way," said the pawnbroker, entering into her humor. "I did n't lend him more 'n a quarter of a dollar at the most."

Miss Catherwaight stood wondering if the Lewis L. Lockwood could be Lewis L. Lockwood, the lawyer, one read so much about. Then she remembered his middle name was Lyman, and said quickly, "I'll take it, please."

She stepped into the carriage, and told the man to go find a directory and look for Lewis Lyman Lockwood. The groom returned in a few minutes and said there was such a name down in the book as a lawyer, and that his office was such a number on Broadway; it must be near Liberty. "Go there," said Miss Catherwaight.

Her determination was made so quickly that they had stopped in front of a huge pile of offices, sandwiched in, one above the other, until they towered mountains high, before she had quite settled in her mind what she wanted to know or had appreciated how strange her errand might appear. Mr. Lockwood was out, one of the young men in the outer office said, but the junior partner, Mr. Latimer, was in and would see her. She had only time to remember that the junior partner was a dancing acquaintance of hers, before young Mr. Latimer stood before her smiling, and with her card in his hand.

"Mr. Lockwood is out just at present, Miss Catherwaight," he said, "but he will be back in a moment. Won't you come into the other room and wait? I am sure he won't be away over five minutes. Or is it something I could do?"

She saw that he was surprised to see her, and a little ill at ease as to just how to take her visit. He tried to make it appear that he con-

sidered it the most natural thing in the world, but he overdid it, and she saw that her presence was something quite out of the common. This did not tend to set her any more at her ease. She already regretted the step she had taken. What if it should prove to be the same Lockwood, she thought, and what would they think of her?

"Perhaps you will do better than Mr. Lockwood," she said as she followed him into the inner office. "I fear I have come upon a very foolish errand, and one that has nothing at all to do with the law."

"Not a breach of promise suit, then?" said young Latimer with a smile. "Perhaps it is only an innocent subscription to a most worthy charity. I was afraid at first," he went on lightly, "that it was legal redress you wanted, and I was hoping that the way I led the Courdert's cotillion had made you think I could conduct you through the mazes of the law as well."

"No," returned Miss Catherwaight with a nervous laugh; "it has to do with my unfortunate collection. This is what brought me here," she said, holding out the silver medal. "I came across it just now in the Bowery. The name was the same, and I thought it just possible Mr. Lockwood would like to have it; and, to tell you the truth, that he might tell me what had become of the Henry Burgoyne who gave it to him."

Young Latimer had the medal in his hand before she had finished speaking, and was examining it carefully. He looked up with just a touch of color in his cheeks and straightened himself visibly.

"Please don't be offended," said the fair collector; "I know what you think. You've heard of my stupid collection, and I know you think I meant to add this to it. But, indeed, now that I have had time to think—you see I came here immediately from the pawnshop, and I was so interested, like all collectors, you know, that I did n't stop to consider. That's the worst of a hobby; it carries one roughshod over other people's feelings, and runs away with one. I beg of you, if you do know anything about the coin, just to keep it and don't tell me, and I assure you what little I know I will keep quite to myself."

Young Latimer bowed, and stood looking at her curiously with the medal in his hand.

"I hardly know what to say," he began slowly. "It really has a story. You say you found this on the Bowery, in a pawnshop. Indeed! Well, of course, you know Mr. Lockwood could not have left it there."

Miss Catherwaight shook her head vehemently and smiled in deprecation.

"This medal was in his safe when he lived

on Thirty-fifth street at the time he was robbed, and the burglars took this with the rest of the silver and pawned it, I suppose. Mr. Lockwood would have given more for it than any one else could have afforded to pay." He paused a moment, and then continued more rapidly: "Henry Burgoyne is Judge Burgoyne. Ah! you did n't guess that? Yes, Mr. Lockwood and he were friends when they were boys. They went to school in Westchester County. They were Damon and Pythias and that sort of thing. They roomed together at the State college and started to practise law in Tuckahoe as a firm, but they made nothing of it, and came on to New York and began reading law again with Fuller & Mowbray. It was while they were at school that they had these medals made. There was a mate to this, you know; Judge Burgoyne had it. Well, they continued to live and work together. They were both orphans and dependent on themselves. I suppose that was one of the strongest bonds between them; and they knew no one in New York, and always spent their spare time together. They were pretty poor, I fancy, from all Mr. Lockwood has told me, but they were very ambitious. They were—I'm telling you this, you understand, because it concerns you somewhat: well, more or less. They were great sportsmen, and whenever they could get away from the law office they would go off shooting. I think they were fonder of each other than brothers even. I've heard Mr. Lockwood tell of the days they lay in the rushes along the Chesapeake Bay waiting for duck. He has said often that they were the happiest hours of his life. That was their greatest pleasure, going off together after duck or snipe along the Maryland waters. Well, they grew rich and began to know people; and then they met a girl. It seems they both thought a great deal of her, as half the New York men did, I am told; and she was the reigning belle and toast, and had other admirers, and neither met with that favor she showed—well, the man she married, for instance. But for a while each thought, for some reason or other, that he was especially favored. I don't know anything about it. Mr. Lockwood never spoke of it to me. But they both fell very deeply in love with her, and each thought the other disloyal, and so they quarreled; and—and then, though the woman married, the two men kept apart. It was the one great passion of their lives, and both were proud, and each thought the other in the wrong, and so they have kept apart ever since. And—well, I believe that is all."

Miss Catherwaight had listened in silence and with one little gloved hand tightly clasping the other.

"Indeed, Mr. Latimer, indeed," she began tremulously, "I am terribly ashamed of myself. I seem to have rushed in where angels fear to tread. I would n't meet Mr. Lockwood *now* for worlds. Of course I might have known there was a woman in the case, it adds so much to the story. But I suppose I must give up my medal. I never could tell that story, could I?"

"No," said young Latimer, dryly; "I would n't if I were you."

Something in his tone, and something in the fact that he seemed to avoid her eyes, made her drop the lighter vein in which she had been speaking, and rise to go. There was much that he had not told her, she suspected, and when she bade him good-by it was with a reserve which she had not shown at any other time during their interview.

"I wonder who that woman was?" she murmured as young Latimer turned from the brougham door and said "Home," to the driver. She thought about it a great deal that afternoon; at times she repented that she had given up the medal, and at times she blushed that she should have been carried in her zeal into such an unwarranted intimacy with another's story.

She determined finally to ask her father about it. He would be sure to know, she thought, as he and Mr. Lockwood were contemporaries. Then she decided finally not to say anything about it at all, for Mr. Catherwaight did not approve of the collection of dishonored honors as it was, and she had no desire to prejudice him still further by a recital of her afternoon's adventure, of which she had no doubt but he would also disapprove. So she was more than usually silent during the dinner, which was a tête-à-tête family dinner that night, and she allowed her father to doze after it in his great chair without disturbing him with either questions or confessions.

They had been sitting there some time, he with his hands folded on the evening paper and with his eyes closed, when the servant brought in a card and offered it to Mr. Catherwaight. Mr. Catherwaight fumbled over his glasses, and read the name on the card aloud: "'Mr. Lewis L. Lockwood.' Dear me!" he said; "what can Mr. Lockwood be calling upon me about?"

Miss Catherwaight sat upright, and reached out for the card with a nervous, gasping little laugh.

"Oh, I think it must be for me," she said; "I'm quite sure it is intended for me. I was at his office to-day, you see, to return him some keepsake of his that I found in an old curiosity shop. Something with his name on it that had been stolen from him and pawned.

It was just a trifle. You need n't go down, dear; I'll see him. It was I he asked for, I'm sure; was it not, Morris?"

Morris was not quite sure; being such an old gentleman, he thought it must be for Mr. Catherwaight he'd come.

Mr. Catherwaight was not greatly interested. He did not like to disturb his after-dinner nap, and he settled back in his chair again and refolded his hands.

"I hardly thought he could have come to see me," he murmured drowsily; "though I used to see enough and more than enough of Lewis Lockwood once, my dear," he added with a smile, as he opened his eyes and nodded before he shut them again. "That was before your mother and I were engaged, and people did say that young Lockwood's chances at that time were as good as mine. But they were n't, it seems. He was very attentive, though; *very* attentive."

Miss Catherwaight stood startled and motionless at the door from which she had turned.

"Attentive—to whom?" she asked quickly and in a very low voice. "To my mother?"

Mr. Catherwaight did not deign to open his eyes this time, but moved his head uneasily as if he wished to be let alone.

"To your mother, of course, my child," he answered; "of whom else was I speaking?"

Miss Catherwaight went down the stairs to the drawing-room slowly, and paused half way to allow this new suggestion to settle in her mind. There was something distasteful to her, something that seemed not altogether unblamable, in a woman's having two men quarrel about her, neither of whom was the woman's husband. And yet this girl of whom Latimer had spoken must be her mother, and she, of course, could do no wrong. It was very disquieting, and she went on down the rest of the way with one hand resting heavily on the railing and with the other pressed against her cheeks. She was greatly troubled. It now seemed to her very sad indeed that these two one-time friends should live in the same city and meet, as they must meet, and not recognize each other. She argued that her mother must have been very young when it happened, or she would have brought two such men together again. Her mother could not have known, she told herself; she was not to blame. For she felt sure that had she herself known of such an accident she would have done something, said something, to make it right. And she was not half the woman her mother had been, she was sure of that.

There was something very likable in the old gentleman who came forward to greet her as she entered the drawing-room; something courtly and of the old school, of which she was

"WHAT CAN MR. LOCKWOOD BE CALLING UPON ME ABOUT?"

so tired of hearing, but of which she wished she could have seen more in the men she met. Young Mr. Latimer had accompanied his guardian, exactly why she did not see, but she recognized his presence slightly. He seemed quite content to remain in the background. Mr. Lockwood, as she had expected, explained that he had called to thank her for the return of the medal. He had it in his hand as he spoke, and touched it gently with the tips of his fingers as though caressing it.

"I knew your father very well," said the lawyer, "and I at one time had the honor of being one of your mother's younger friends. That was before she was married, many years ago." He stopped and regarded the girl gravely and with a touch of tenderness. "You will pardon an old man, old enough to be your father, if he says," he went on, "that you are greatly like your mother, my dear young lady — greatly like. Your mother was very kind to me, and I

fear I abused her kindness; abused it by misunderstanding it. There was a great deal of misunderstanding; and I was proud and my friend was proud, and so the misunderstanding continued, until now it has become irretrievable."

He had forgotten her presence apparently, and was speaking more to himself than to her as he stood looking down at the medal in his hand.

"You were very thoughtful to give me this," he continued; "it was very good of you. I don't know why I should keep it though, now, although I was distressed enough when I lost it. But now it is only a reminder of a time that is past and put away, but which was very, very dear to me. Perhaps I should tell you that I had a misunderstanding with the friend who gave it to me, and since then we have never met; have ceased to know each other. But I have always followed his life as a judge and as a lawyer, and respected him

for his own sake as a man. I cannot tell — I do not know how he feels towards me.”

The old lawyer turned the medal over in his hand and stood looking down at it wistfully.

The cynical Miss Catherwaight could not stand it any longer.

“Mr. Lockwood,” she said impulsively, “Mr. Latimer has told me why you and your friend separated, and I cannot bear to think that it was she — my mother — should have been the cause. She could not have understood; she must have been innocent of any knowledge of the trouble she had brought to men who were such good friends of hers and to each other. It seems to me as though my finding that coin is more than a coincidence. I somehow think that the daughter is to help undo the harm that her mother has caused — unwittingly caused. Keep the medal and don’t give it back to me, for I am sure your friend has kept his, and I am sure he is still your friend at heart. Don’t think I am speaking hastily or that I am thoughtless in what I am saying, but it seems to me as if friends — good, true friends — were so few that one cannot let them go without a word to bring them back. But though I am only a girl, and a very light and unfeeling girl, some people think, I feel this very much, and I do wish I could bring your old friend back to you again as I brought back his pledge.”

“It has been many years since Henry Burgoyne and I have met,” said the old man, slowly, “and it would be quite absurd to think that he still holds any trace of that foolish, boyish feeling of loyalty that we once had for each other. Yet I will keep this, if you will let me, and I thank you, my dear young lady, for what you have said. I thank you from the bottom of my heart. You are as good and as kind as your mother was, and — I can say nothing, believe me, in higher praise.”

He rose slowly and made a movement as if to leave the room, and then, as if the excitement of this sudden return into the past could not be shaken off so readily, he started forward with a move of sudden determination.

“I think,” he said, “I will go to Henry Burgoyne’s house at once, to-night. I will act on what you have suggested. I will see if this has or has not been one long, unprofitable mistake. If my visit should be fruitless I will send you this coin to add to your collection of dishonored honors, but if it should result as I hope it may, it will be your doing, Miss Catherwaight, and two old men will have much to thank you for. Good-night,” he said as he bowed above her hand, “and — God bless you!”

Miss Catherwaight flushed slightly at what

he had said, and sat looking down at the floor for a moment after the door had closed behind him.

Young Mr. Latimer moved uneasily in his chair. The routine of the office had been strangely disturbed that day, and he now failed to recognize in the girl before him with reddened cheeks and trembling eyelashes the cold, self-possessed young woman of society whom he had formerly known.

“You have done very well, if you will let me say so,” he began gently. “I hope you are right in what you said, and that Mr. Lockwood will not meet with a rebuff or an ungracious answer. Why,” he went on quickly, “I have seen him take out his gun now every spring and every fall for the last ten years and clean and polish it and tell what great shots he and Henry, as he calls him, used to be. And then he would say he would take a holiday and get off for a little shooting. But he never went. He would put the gun back into its case again and mope in his library for days afterward. You see, he never married, and though he adopted me, in a manner, and is fond of me in a certain way, no one ever took the place in his heart his old friend had held.”

“You will let me know, will you not, at once, — to-night, even, — whether he succeeds or not?” said the cynical Miss Catherwaight. “You can understand why I am so deeply interested. I see now why you said I would not tell the story of that medal. But, after all, it may be the prettiest story, the only pretty story I have to tell.”

Mr. Lockwood had not returned, the man said, when young Latimer reached the home the lawyer had made for them both. He did not know what to argue from this, but determined to sit up and wait, and so sat smoking before the fire and listening with his sense of hearing on a strain for the first movement at the door.

He had not long to wait. The front door shut with a clash, and he heard Mr. Lockwood crossing the hall quickly to the library, in which he waited. Then the inner door was swung back, and Mr. Lockwood came in with his head high and his eyes smiling brightly.

There was something in his step that had not been there before, something light and vigorous, and he looked ten years younger. He crossed the room to his writing-table without speaking and began tossing the papers about on his desk. Then he closed the rolling-top lid with a snap and looked up smiling.

“I shall have to ask you to look after things at the office for a little while,” he said. “Judge Burgoyne and I are going to Maryland for a few weeks’ shooting.”

Richard Harding Davis.

COLONEL CARTER OF CARTERSVILLE.—II.

BY F. HOPKINSON SMITH.

AN OLD FAMILY SERVANT.

THE colonel's front yard, while as quaint and old fashioned as his house, was not — if I may be allowed — quite so well bred.

This came partly from the outdoor life it had always led and from its close association with other yards that had lost all semblance of respectability, and partly from the fact

that it had never felt the refining influences of the friends of the house; for nobody ever lingered in the front yard who by any possibility could get into the front door — nobody, except perhaps now and then a stray tramp, who felt at home at once and went to sleep on the steps.

That all this told upon its character and appearance was shown in the remains of the whitewash on the high wall, scaling off in discolored patches; in the stagger of the tall fence opposite, drooping like a drunkard between two policemen of posts; and in the unkempt, bulging rear of the third wall, — the front house, — stuffed with rags and tied up with clothes-lines.

If in the purity of its youth it had ever seen better days as a garden — but then no possible stretch of imagination, however brilliant, could ever convert this miserable quadrangle into a garden.

It contains, of course, as all such yards do, one lone plant, — this time a honeysuckle, — which in the innocence of its youth had clambered over the front door and there rested as if content to stay; but which later on, frightened at the surroundings, had with one great spring cleared the slippery wall between, reached the rain-spout above, and by its helping arm thus escaped to the roof and the sunlight.

It is also true that high up on this same wall there still clings the remains of a criss-cross wooden trellis supporting the shivering branches of a vine of some kind which had

spent its whole life, only to die in the attempt, in trying to grow high enough to look over the tall fence into the yard beyond; but this was so long ago that not even the landlord remembers the color of its blossoms.

Then there is an old-fashioned hydrant, with a half-spiral crank of a handle on its top and the curved end of a lead pipe always aleak thrust through its rotten side, with its little statues of ice all winter and its spattering slop all summer.

Besides all this there are some broken flower-pots in a heap in one corner, — suicides from the window-sills above, — and some sagging clothes-lines, and a battered watering-pot, and a box or two that might once have held flowers; and yet with all this circumstantial evidence against me I still cannot conscientiously believe that this forlorn courtyard ever could have risen to the dignity of a garden.

But of course nothing of all this can be seen at night. At night one sees only the tall clock tower of Jefferson Market with its one blazing eye glaring high up over the fence, the little lantern hung in the tunnel, and the glow through the curtains shading the old-fashioned windows of the house itself, telling of the warmth and comfort within.

To-night when I push open the swinging door — the door of the tunnel entering from the street — the lantern is gone, and in its stead I see only the glimmer of a mysterious light moving around the yard — a light that comes and goes, falling now on the bare wall, then on the front steps, making threads of gold of the twisted iron railings, on the posts of the leaning fence, against which hang three feathery objects, grotesque and curious in the changing shadows, and again on some barrels and boxes surrounded by loose straw.

Following this light — in fact, guiding it — is a noiseless, crouching figure that peers under the open steps, gropes around the front door, creeps beneath the windows, moving uneasily with a 'burglar-like tread.

I grasp my umbrella, advance to the edge of the tunnel, and call out:

"Who 's that?"

The figure stops, straightens up, holds a lantern high over his head, and peers into the darkness.

There is no mistaking that face.

"Oh, that 's you, Chad, is it? What the devil are you doing?"

"WHO 'S THAT?"

"Lookin' for one ob dese yer tar'pins Miss Nancy sent de colonel. Dey was seben ob 'em in dis box, an' now dey ain't but six. Hole dis light, Major, an' lemme fumble round dis rain-spout."

Chad handed me the lantern, fell on his knees, and began crawling around the small yard like an old dog hunting for a possum, feeling in among the roots of the honeysuckle, between the barrels in which the colonel's china came from Carter Hall, under the steps, way back where Chad kept his wood ashes—but no "brer tar'pin."

"Well, if dat don't beat de lan'! Dey was two ba'els—one had dat wild turkey an' de pair o' geese you see hangin' on de fence dar, an' de udder ba'el I jes ca'ed down de cellar full er oishters. De tar'pins was in dis box—seben ob 'em. Spec' dat rapscallion crawled ober de fence?" And Chad picked up the basket with the remaining half-dozen and descended the basement steps on his way through the kitchen to the front door above. Before he reached the bottom step I heard him break out with:

"Oh, yer you is, you black debbil! Tryin' to git in de door, is ye? De pot is whar you 'll git!"

At the foot of the short steps, flat on his back, head and legs wriggling like an overturned roach, lay the missing terrapin. It had

crawled to the edge of the opening and had fallen down in the darkness.

Chad picked him up and kept on grumbling, shaking his finger at the motionless terrapin, whose head and legs were now tight drawn between its shells.

"Gre't mine to squash ye! Wearin' out my old knees lookin' for ye. Nebber mine, I 'm gwine to bile ye fust an' de longest—hear dat?—de longest!" Then looking up at me, he said, "I got him, Major—try dat do'. Spec' it 's open. Colonel ain't yer yit. Reckon some ob dem moonshiners is keepin' him down town. 'Fo' I forgit it, dar 's a letter for ye hangin' to de mantelpiece."

The door and the letter were both opened, the latter being half a sheet of paper impaled by a pin, which alone saved it from the roaring fire that Chad had just replenished.

I held it to the light and learned, to my disappointment, that business of enormous importance to the C. & W. A. L. R. R. might preclude the possibility of the colonel's leaving his office until late. If such a calamity overtook him, would I forgive him and take possession of his house and cellar and make myself as comfortable as I could with my best friend away? This postscript followed:

"Open the new Madeira; Chad has the key."

Chad wreaked his vengeance upon the absconding terrapin by plunging him with all his sins upon him headlong into the boiling pot, and half an hour later was engaged at a side table in removing, with the help of an iron fork, the upper shell of the steaming vagabond, for my special comfort and sustenance.

"Tar'pin jes like a crab, Major, on'y got mo' meat to 'em. But you got to know 'em fust to eat 'em. Now dis yer shell is de hot plate, an' ye do all yo' eatin' right inside it," said Chad, dropping a spoonful of butter, the juice of a lemon, and a pinch of salt into the impromptu dish.

"Now, Major, take yo' fork an' pick out all dat black meat an' dip it in de sauce, an' wid ebery mou'ful take one o' dem little yaller eggs. Dat 's de way *we* eat tar'pin. Dis yer stewin' him up in pote wine is scand'lous. Can't taste nuffin' but de wine. But dat 's *tar'pin*."

I followed Chad's directions to the word, picking the terrapin as I would a crab and smothering the dainty bits in the hot sauce, until only two empty shells and a heap of little bones were left to tell the tale of my appetite.

"Gwine to crawl ober de fence, was ye?" I heard him say with a chuckle as he bore away the debris. "What I tell ye? Whar am ye now?"

"Did Miss Nancy send those terrapin?" I

asked, watching the old ducky drawing the cork of the new Madeira referred to in the colonel's note.

"Ob co'se, Major; Miss Nancy gibs de colonel eberythin'. Did n't ye know dat? She's de on'y one what's got anythin' to gib, an' she would n't hab dat on'y frough de war her money was in de bank in Baltimo'. I know, 'cause I went dar once to git some for her. De Yankee soldiers searched me; but some possums got two holes."

"And did she send him the Madeira too?"

"No, sah; Mister Grocerman gib him dat."

For some time he kept silent, brushing the crumbs away, replacing a plate or two, or filling my wine-glass, until at last he took his place behind my chair as was his custom with his master.

It was easy to see that Chad had something on his mind.

Every now and then a sigh escaped him, which he tried to conceal by some irrelevant remark, as if his sorrow was his own and not to be shared with a stranger. Finally he gave an uneasy glance around, and, looking into my face with an expression of positive pain, said:

"Don't tell de colonel I axed, but when is dis yer railroad gwinter fotch some money in?"

"Why?" said I, wondering what extravagance the old man had fallen into.

"Nuffin', sah; but if it don't putty quick, dar's gwinter be trouble. Dese yer gemmen on de av'nue is gittin' ugly. When I got dat Madary de udder day de tall one war n't gwine to gib it to me, pass-book or no pass-book. On'y de young one say he'd seen de colonel, an' he was a gemmen an' all right, I would n't 'a' got it at all. De tall gemmen was comin' right around hisself—what he wanted to see, he said, was de color ob de colonel's money. Been mo' den two months, an' not a cent.

"Co'se I tole same as I been tellin' him, dat de colonel's folks is quality folks; but he say dat don't pay de bills."

"Did you tell the colonel?"

"No, sah; ain't no use tellin' de colonel; on'y worry him. He's got de pass-book, but I ain't yerd him say nuffin' yit 'bout payin' him. I been spectin' Miss Nancy up here, an' de colonel says she's comin' putty soon. She'll fix 'em; but dey ain't no time to waste."

While he spoke there came a sharp knock at the door, and Chad returned trembling all over with excitement and fear, with a face the very picture of despair.

"Dat's de tall man hisself, sah, an' his dander's up. I knowed dese Yankees in de war, an' I don't like 'em when dey's ris'. When I tole him de colonel ain't home he look at me pizen-like, same as I was a-lyin'; an' den

he stop an' listen an' say he come back to-night. Trouble comin'; old coon smells de dog. Wish we was home an' out ob dis!"

I tried to divert his attention into other channels and calm his fears, assuring him that the colonel would come out all right; that these enterprises were slow, etc.; but the old man only shook his head.

"You know, Major, de colonel ain't nuffin' but a chile, an' about his bills he's *wuss*. But I'm yer, an' I'm 'sponsible. 'Chad,' he says, 'go out an' git six mo' bottles of dat old Madary'; an' 'Chad, don't forgit de sweet ile'; an' 'Chad, is we got claret enough to last ober Sunday?'—an' not a cent in de house. I ain't slep' none for two nights, worritin' ober dis business, an' I'm mos' crazy."

I laid down my knife and fork and looked up. The old man's lip was quivering, and something very like a tear stood in each eye.

"I can't hab nuffin' happen to de fambly, Major. You know our folks is quality, an' always was, an' I dassent look my mistress in de face if anythin' teches Marsa George." Then bending down he said in a hoarse whisper: "See dat old clock out dar wid his eye

"MISTER GROCERMAN."

always open? Know what's down below dat in de cellar? De jail!" And two tears rolled down his cheeks.

It was some time before I could quiet the old ducky's anxieties and coax him back into his usual good humor, and then only when I began to ask him of the old plantation days.

Then he fell to talking about the colonel's father, Marsa John Carter, and the high days at Carter Hall when Miss Nancy was a young

lady and the colonel a boy home from the university.

"Dem was high times. We ain't neber seed no time like dat since de war. Git up in de mawnin' an' look out ober de lawn an' yer come fo'teen or fifteen couples ob de fustest quality folks, all on horseback ridin' in de gate. Den such a scufflin' round! Old marsa an' missis out on de po'ch an' de little piccanninies runnin' from de quarters, an' all hands helpin' 'em off de horses, an' dey all smokin' hot wid de gallop up de lane.

"An' den such a breakfast an' such dancin' an' co'tin'; ladies all out on de lawn in der white dresses, an' de gemmen in fair-top boots, an' Mammy Jane runnin' round same as a chicken wid its head off—an' der heads was off befo' dey knowed it, an' dey a-br'ilin' on de gridiron.

"Dat would go on a week or mo', an' den up dey 'll all git an' away dey 'd go to de nex' plantation, an' take Miss Nancy along wid 'em on her little sorrel mare, an' I on Marsa John's black horse, to take care bofe of 'em. Dem *was* times!

"My old marsa,"—and his eyes glistened,—
"my Marsa John was a gemman, sah, like dey don't see nowadays. Tall, sah, an' straight as a cornstalk; hair white an' silky as de tassel; an' a voice like de birds was singin', it was dat sweet.

"Chad, he use' ter say,—you know I was young den, an' I was his bodyservant,—'Chad, come yer till I bre'k yo' head'; an' den when I come he 'd laugh fit to kill hisself. Dat 's when you do right. But when you was a low-down nigger an' got de debbil in yer, an' ole marsa hear it an' send de oberseer to de quarters for you to come to de little room in de big house whar de walls was all books an' whar his desk was, 't wa'n't no birds about his voice den—mo' like de thunder."

"Did he whip his negroes?"

"No, sah; don't reckel member a single lick laid on airy nigger dat de marsa knowed of; but when dey got so bad,—an' some niggers is dat way,—den dey was sold to de swamp lan's. He would n't had 'em round 'ruptin' his niggers, he use' ter say.

"Hab coffee, sah? Won't take me a minute to bile it. Colonel ain't been drinkin' none lately, an' so I don't make none."

I nodded my head, and Chad closed the door softly, taking with him a small cup and saucer, and returning in a few minutes followed by that most delicious of all aromas, the savory steam of boiling coffee.

"My Marsa John," he continued, filling the cup with the smoking beverage, "never drank nuffin' but tea, eben at de big dinners when all de gemmen had coffee in de little cups—

dat 's one ob 'em ye is drinkin' out ob now; dey ain't mo' than fo' on 'em left. Ole marsa would have his pot ob tea: Henny use' ter make it for him; makes it now for Miss Nancy.

"Henny was a young gal den, long 'fo' we was married. Henny b'longed to Colonel Lloyd Barbour, on de next plantation to ourn.

"Mo' coffee, Major?" I handed Chad the empty cup. He refilled it, and went straight on without drawing breath.

"Wust scrape I eber got into wid ole Marsa John was ober Henny. She was a harricane in dem days. She come into de kitchen once where I was helpin' git de dinner ready an' de cook had gone to de spring house, an' she says:

"Chad, what ye cookin' dat smells so nice?"

"Dat 's a goose," I says, 'cookin' for Marsa John's dinner. We got quality,' says I, pointin' to de dinin'-room do'.

"Quality!" she says. 'Spec' I know what de quality is. Dat 's for you an' de cook.'

"Wid dat she grabs a carvin' knife from de table, opens de do' ob de big oven, cuts off a leg ob de goose, an' dis'pears round de kitchen corner wid de leg in her mouf.

"Fo' I knowed whar I was Marsa John come to de kitchen do' an' says, 'Gittin' late, Chad; bring in de dinner.' You see, Major, dey ain't no up an' down stairs in de big house, like it is here; kitchen an' dinin'-room all on de same flo'.

"Well, sah, I was scared to def, but I tuk dat goose an' laid him wid de cut side down on de bottom of de pan 'fo' de cook got back, put some dressin' an' stuffin' ober him, an' shet de stove do'. Den I tuk de sweet potatoes an' de hominy an' put 'em on de table, an' den I went back in de kitchen to git de baked ham. I put on de ham an' some mo' dishes an' marsa says, lookin' up:

"I t'ought dere was a roast goose, Chad?"

"I ain't yerd nothin' 'bout no goose," I says. 'I 'll ask de cook.'

"Next minute I yerd ole marsa a-hollerin':

"Mammy Jane, ain't we got a goose?"

"Lord-a-massy! yes, marsa. Chad, you wu'thless nigger, ain't you tuk dat goose out yit?"

"Is we got a goose?" said I.

"Is we got a goose? Did n't you help pick it?"

"I see whar my hair was short, an' I snatched up a hot dish from de hearth, opened de oven do', an' slide de goose in just as he was, an' lay him down befo' Marsa John.

"Now see what de ladies 'll have for dinner,' says ole marsa, pickin' up his carvin' knife.

"What 'll you take for dinner, miss?' says I. 'Baked ham?'

"No," she says, lookin' up to whar Marsa John sat; 'I think I 'll take a leg ob dat goose'—jes so.

"Well, marsa cut off de leg an' put a little stuffin' an' gravy on wid a spoon, an' says to me, 'Chad, see what dat gemman 'll have.'

"What 'll you take for dinner, sah?' says I. 'Nice breast o' goose, or slice o' ham?'

"CHAD, DID YOU FIND ANY MONEY ON THE FLO' WHEN YOU BRUSHED MY CLOTHES?" (SEE PAGE 235.)

"No; I think I 'll take a leg of dat goose."

"I did n't say nuffin', but I knowed bery well he wa' n't a-gwine to git it.

"But, Major, you oughter seen ole marsa lookin' for de udder leg ob dat goose! He rolled him ober on de dish, dis way an' dat way, an' den he jabbed dat ole bone-handled carvin' fork in him an' hel' him up ober de dish an' looked under him an' on top ob him, an' den he says, kinder sad like:

"Chad, whar is de udder leg ob dat goose?'

"It did n't hab none," says I.

"You mean to say, Chad, dat de gooses on my plantation on'y got one leg?'

"Some ob 'em has an' some ob 'em ain't. You see, marsa, we got two kinds in de pond, an' we was a little hurried to-day, so Mammy Jane cooked dis one 'cause I cotched it fust."

"Well," said he, lookin' like he look when he send for you in de little room, 'I 'll settle wid ye after dinner.'

"Well, dar I was shiverin' an' shakin' in my shoes, an' droppin' gravy an' spillin' de wine on de table-cloth, I was dat shuck up; an' when de dinner was ober he calls all de ladies an' gemmen, an' says, 'Now come down to de duck pond. I 'm gwine to show dis nigger dat all de gooses on my plantation got mo' den one leg.'

"I followed 'long, trapesin' after de whole kit an' b'ilin', an' when we got to de pond"—here Chad nearly went into a convulsion with suppressed laughter—"dar was de gooses sittin' on a log in de middle of dat ole green goose-pond wid one leg stuck down—so—an' de udder tucked under de wing."

Chad was now on one leg, balancing himself on my chair, the tears running down his cheeks.

"Dar, marsa," says I, 'don't ye see? Look at dat ole gray goose! Dat 's de berry match ob de one we had to-day.'

"Den de ladies all hollered an' de gemmen laughed so loud dey yerd 'em at de big house.

"Stop, you black scoundrel!' Marsa John says, his face gittin' white an' he a-jerkin' his handkerchief from his pocket. 'Shoo!'

"Major, I hope to have my brains kicked out by a lame grasshopper if ebery one ob 'em gooses did n't put down de udder leg!

"Now, you lyn' nigger,' he says, raisin' his cane ober my head, 'I 'll show you—'

"Stop, Marsa John!' I hollered; 't ain't fair, 't ain't fair.'

"Why ain't it fair?' says he.

"Cause," says I, 'you did n't say "Shoo!" to de goose what was on de table.'"¹

Chad laughed until he choked.

"And did he thrash you?'

"Marsa John? No, sah. He laughed loud as anybody; an' den dat night he says to me as I was puttin' some wood on de fire:

"Chad, where did dat leg go?' An' so I ups an' tells him all about Henny, an' how I was 'feared de gal would git hurt, an' how she was on'y a-foolin', thinkin' it was my goose; an' den de ole marsa look in de fire for a long time, an' den he says:

"Dat 's Colonel Barbour's Henny, ain't it, Chad?'

"Yes, marsa," says I.

"Well, de next mawnin' he had his black horse saddled, an' I held de stirrup for him to

¹ This story, and the story of the "Postmaster" in the November part, I have told for so many years and to so many people, and with such varied amplifications, that I have long since persuaded myself that they are

creations of my own. I surmise, however, that the basis of the "Postmaster" could be found in the corner of some forgotten newspaper, and I know that the "One-Legged Goose" is as old as the "Decameron."

git on, an' he rode ober to de Barbour plantation an' did n't come back till plumb black night. When he come up I held de lantern so I could see his face, for I wa'n't easy in my mine all day. But it was all bright an' shinin' same as a' angel's.

"'Chad,' he says, handin' me the reins, 'I bought yo' Henny dis artemnoon from Colonel Barbour, an' she 's comin' ober to-morrow, an' you can bofe git married next Sunday.'"

A SHARP knock at the outer door, and the next moment the colonel was stamping his feet on the hall mat, his first word to Chad an inquiry after my comfort, and his second an apology to me for what he called his brutal want of hospitality.

"But I could n't help it, Major. I had some letters, suh, that could not be postponed. Has Chad taken good care of you? No dinner, Chad; I dined downtown. How is the Madeira, Major?"

I expressed my entire approbation of the wine and was about to fill the colonel's glass when Chad leaned over with the same anxious look in his face.

"De grocerman was here, Colonel, an' lef' word dat he was comin' again later."

"You don't say so, Chad, and I was out: most unfortunate occurrence! When he calls again show him in at once. It will give me great pleasure to see him."

Then turning to me, his mind on the pass-book and its empty pages — "I'll lay a wager that man's father was a gentleman. The fact is, Major, I have not treated him with proper respect. He has shown me every courtesy since I have been here, and I am ashamed to say that I have not entered his doors once. His calling twice in one evening touches me deeply. I did not expect to find yo' tradespeople so polite."

Chad's face was a study while his master spoke, but he was too well trained, and still too anxious over the outcome of the expected interview, to do more than bow obsequiously to the colonel — his invariable custom when receiving an order — and close the door behind him.

"That old servant," continued the colonel, watching Chad leave the room, and drawing his chair nearer the fire, "has been in my family ever since he was bawn. But for him and his old wife, Mammy Henny, I would be homeless to-night." And then the colonel, with that soft cadence in his voice which I always noticed when he was speaking of something that touched his heart, told me with evident feeling how, in every crisis of fire, pillage, and raid through which the old house had passed, these two faithful souls had kept un-

"THE COLONEL WAS STANDING ON THE MAT."

ceasing watch about the place; refastening the wrenched doors, replacing the shattered shutters, or extinguishing the embers of abandoned bivouac fires. Indeed, for months at a time they were its only occupants, outside of strolling marauders and bands of foragers, and but for their untiring devotion its tall chimneys would long since have stood like tombstones over the grave of its ashes. Then he added, with a break in his voice that told how deeply he felt it:

"Do you know, Major, that when I was a prisoner at City Point that nigger tramped a hundred miles through the coast swamps to reach me, crossed both lines twice, hung around for three months for his chance, and has carried in his leg ever since the ball intended for me the night I escaped in his clothes and he was shot in mine.

"I tell you, suh, the color of a man's skin don't make much difference sometimes. Chad was bawn a gentleman, and he 'll never get over it."

As he was speaking the object of his eulogy opened the hall door, and the next instant a tall, red-headed man with closely trimmed side whiskers, and wearing a brown check suit and a blue necktie, ran the gantlet of Chad's profound but anxious bow, and advanced towards the colonel, hat in hand. The colonel arose gracefully.

"Which is Mr. Carter?"

"I am Colonel Caarter, suh, and I presume you are the gentleman to whom I am indebted

for so many courtesies. My servant tells me that you called earlier in the evenin'. I regret, suh, that I was detained so late at my office, and I have to thank you for perseve'in' the second time. I assure you, suh, that I esteem it a special honor."

The tall gentleman with the auburn whiskers wiped his face with his handkerchief, which he took from his hat, and stated with some timidity that he hoped he did not intrude at that late hour. He had sent his pass-book, and—

"I have looked it over, suh, repeatedly, with the greatest pleasure. It is a custom new to us in my county, but it meets with my hearty approval. Give yo' hat to my servant, suh, and take this seat by the fire."

The proprietor of the hat after some protestations suffered Chad to bear away that protection to his slightly bald head,—retaining his handkerchief, which he finally rolled up into a little wad and held tightly clenched in the perspiring palm of his left hand,—and then threw out the additional hope that everything was satisfactory.

"Delicious, suh; I have not tasted such Madeira since the wah. In my cellar at home, suh, I once had some old Madeira of '28 that was given to my father, the late General John Caarter, by old Judge Thornton. You, of course, know that wine, suh. Ah! I see that you do."

And then followed one of the colonel's delightful monologues descriptive of all the vintages of that year, the colonel constantly appealing to the dazed and delighted groceryman to be set right in minor technical matters,—of which the grocer knew as much as he did about the Aztec dialects,—the colonel supplying the needed data himself, and then thanking the auburn gentleman for the information so charmingly that for the moment that worthy tradesman began to wonder why he had not long before risen from the commonplace level of canned vegetables to the more sublime plane of wines in the wood.

"Now the Madeira you sent me this mornin', suh, is a trifle too fruity for my taste. Chad, open a fresh bottle."

The owner of the pass-book instantly detected a very decided fruity flavor, but thought he had another wine, which he would send in the morning, that might suit the colonel's palate better.

The colonel thanked him, and then drifted into the wider field of domestic delicacies,—the preserving of fruits, the making of pickles as practised on the plantations by the old Virginia cooks,—the colonel waxing eloquent over each production, and the future wine merchant becoming more and more enchanted as the colonel flowed on.

When he rose to go the grocer had a mental list of the things he would send the colonel in the morning all arranged in his commercial head, and so great was his delight that after shaking hands with me once and with the colonel three times, he would have extended that courtesy also to Chad had not that perfectly trained servant checkmated him by filling his extended palm with the rim of his own hat.

When Chad returned from bowing him through the tunnel, the lines in his face a tangle of emotions, the colonel was standing on the mat—back to the fire, coat thrown open, thumbs in his armholes, and his outstretched fingers beating woodpecker tattoos on his vest.

Somehow the visit of the grocer had lifted him out of the cares of the day. How, he could not tell. Perhaps it was the fragrance of the Madeira; perhaps the respectful, over-awed bow,—the bow of the tradesman the world over to the landed proprietor,—restoring to him for one brief moment that old feudal supremacy which above all else his soul loved; perhaps it was only the warmth and cheer and comfort of it all.

Whatever it was, it buoyed and strengthened him. He was again in the old dining-hall at home: the servants moving noiselessly about; the cut-glass decanters reflected in the polished mahogany; the candles lighted; his old, white-haired father, in his high-backed chair, sipping his wine from the slender glass.

Ah, the proud estate of the old plantation days! Would they ever be his again?

THE ARRIVAL OF A TRUE SOUTHERN LADY.

"MISTRESS yer, sah! Come yistidd'y maw-nin'."

How Chad beams all over when this simple statement falls from his lips!

I have not seen him since the night when he stood behind my chair and with bated breath whispered his anxieties lest the second advent of "de grocerman" should bring dire destruction to the colonel's household.

To-day he looks ten years younger. His kinky gray hair, generally knotted into little wads, is now divided by a well-defined path starting from the great wrinkle in his forehead and ending in a dense tangle of underbrush that no comb dare penetrate. His face glistens all over. His mouth is wide open, showing a great cavity in which each tooth seems to dance with delight. His jacket is as white and stiff as soap and starch can make it, while a cast-off cravat of the colonel's—double starched to suit Chad's own ideas of propriety—is tied in a single knot, the two ends reaching to the

very edge of each ear. To crown all, a red carnation flames away on the lapel of his jacket, just above an outside pocket, which holds in check a pair of white cotton gloves bulging with importance and eager for use. Every time he bows he touches with a sweep both sides of the narrow hall.

It was the first time I had seen the interior of the colonel's cozy dining-room by daylight. Heretofore my visits had always been after dark, with lighted candles, roaring wood fires, and drawn curtains. But this time it was in the morning,—and a bright, sunny, lovely spring morning at that,—with one window open in the L and the curtains drawn back from the other; with the honeysuckle beginning to bud, its long runners twisting themselves inquiringly through the half-closed shutters as if anxious to discover what all this bustle inside was about.

It was easy to see that some other touch besides that of the colonel and his faithful man-of-all-work had left its impress in the bachelor apartment. There was a general air of order apparent. The irregular line of foot gear which decorated the wash-board of one wall, beginning with a pair of worsted slippers and ending with a wooden bootjack, was gone. Whisk-brooms and dusters that had never known a restful nail since they entered the colonel's service were now suspended peacefully on convenient hooks. Dainty white curtains gathered like a child's frock flapped lazily against the broken green blinds, and some sprays of arbutus plucked by Miss Nancy on her way to the station drooped about a tall glass on the mantel.

Chad had solved the mystery — Aunt Nancy came yesterday.

I found the table set for four, its chief feature being a tray bearing a heap of egg-shell cups and saucers I had not seen before, and an old-fashioned tea-urn humming a tune all to itself.

"The colonel is out, but will return in a few minutes," Chad said eagerly, all out of breath with excitement. Mr. Fitzpatrick was coming to breakfast, and he was to tell Miss Nancy the moment we arrived. He then reduced the bulge in his outside pocket by thrusting his big hands into his white gloves, gave a sidelong glance at the flower in his button-hole, and bore my card aloft with the air of a cupbearer serving a princess.

A soft step on the stair, the rustle of silk, a warning word outside: "Look out for dat lower step, mistress—dat 's it"; and Miss Nancy entered the room.

No, I am wrong. She became a part of it; as much so as the old andirons and the easy chairs and the old-fashioned mantelpieces, the

snowy curtains and the trailing vine. More so when she gave me the slightest dip of a courtesy and laid her dainty, wrinkled little hand in mine, and said in the sweetest possible voice how glad she was to see me after so many years, and how grateful she felt for all my kindness to the dear colonel. Then she sank into a quaint rocking-chair that Chad had brought down behind her, rested her feet on a low stool that mysteriously appeared from under the table, and took her knitting from her reticule.

She had changed somewhat since I last saw her, but only as would an old bit of precious stuff that as it grew the older grew only the more mellow and harmonious in tone. She had the same silky gray hair—a trifle whiter, perhaps; the same frank, tender mouth, winning wherever she smiled; the same slight, graceful figure; and the same manner—its very simplicity a reflex of that refined and quiet life she had always led.

It had been an isolated life, buried since her girlhood in a great house far away from the broadening influences of a city, and saddened by the daily witness of a slow decay of all she had been taught to revere; but it had been a life so filled with the largeness of generous deeds that its returns had brought her only the love and reverence of every living soul she knew.

While she sat and talked to me of her journey I had time to enjoy again the quaintness of her dress—the quaintness of forty years ago. There was the same old-fashioned, soft gray silk with up-and-down stripes spotted with sprigs of flowers, the lace cap with its frill of narrow pink ribbons and two wide pink strings that fell over the shoulders, and the handkerchief of India mull folded across the breast and fastened with an amethyst pin. Her little bits of feet—they were literally so—were incased in white stockings and heelless morocco slippers bound with braid.

Her dress was not somber. It never was. She always seemed to remember even in her bright ribbons and silks the days of her girlhood, when half the young men in the county were wild about her. When she moved she wafted towards you a perfume of sweet lavender—the very smell that you remember came from your own mother's old-fashioned bureau drawer when she let you stand on tiptoe to see her pretty things. When you kissed her—and once I did—her cheek was as soft as a child's and fragrant with rose-water.

But I hear the colonel's voice outside, laughing with Fitz.

"Come in, suh, and see the dearest woman in the world."

The next instant he burst in dressed in his

gala combination — white vest and cravat, the old coat thrown wide open as if to welcome the world, and a bunch of red roses in his hands.

"Nancy, here 's my dear friend Fitz whom I have told you about — the most extraordinary man of modern times. Ah, Major! you here? Came in early, did you, so as to have Aunt Nancy all to yo'self? Sit down, Fitz, right alongside of her." He kissed her hand gallantly. "Is n't she the most delightful bit of old porcelain you ever saw in all yo' bawn days?"

Miss Nancy rose, made another of her graceful courtesies, and begged that neither of us would mind the colonel's railery — she never could keep him in order; and she laughed softly as she gave her hand to Fitz, who touched it very much as if he quite believed the colonel's reference to the porcelain to be true.

"There you go, Nancy, 'busin' me like a dog, and here I have been a-trampin' the streets for a' hour lookin' for flowers for you! You are breakin' my heart, Miss Caarter, with yo' coldness and contempt. Another word and you shall not have a single bud." And the colonel gaily tucked a rose under her chin with a loving stroke of his hand, and threw the others in a heap into her lap.

"Breakfast sarved, mistress," said Chad in a low voice.

The colonel gave his arm to his aunt with the air of a courtier; Fitz and I disposed ourselves on each side; Chad with reverential mien screwed his eyes up tight; and the colonel said grace with an increased fervor in his voice, no doubt remembering in his heart the blessing of the last arrival.

THROUGHOUT the entire repast the colonel was in his gayest mood, brimming over with anecdotes and personal reminiscences and full of his rose-colored plans for the future.

Many things had combined to produce this happy frame of mind. First, there was the scheme, which had languished for weeks owing to the vise-like condition of the money market, — another of Fitz's mendacious excuses, — and which had now been suddenly galvanized into temporary life by an inquiry made by certain bankers who were seeking an outlet for English capital, and who had expressed a desire to investigate the "Garden Spot-of Virginia." Only an "inquiry," but to the colonel the papers were already signed. Then there was the arrival of his distinguished guest, whom he loved devotedly with a certain old-school gallantry and tenderness as picturesque as it was interesting, and last of all there was that important episode of the bills. For Miss Nancy, the night she arrived, had collected all the

household accounts, — they were all of the one kind, unpaid, — including the highly esteemed pass-book, and had despatched Chad early in the morning to the several creditors with his pocket full of crisp bank notes.

When the colonel had grasped the full meaning of Chad's mission — which he did on his return from this liquidating tour — he buttoned his coat tightly over his chest, straightened himself up, sought out his aunt, and said with some dignity and a slightly injured air:

"Nancy, yo' interfe'ence in my household affairs this mornin' was vely creditable to yo' heart and deeply touches me; but if I thought you regarded it in any other light except as a short temporary loan, it would offend me keenly. Within a few days, however, I shall receive a vely large amount of secu'ities from an English syndicate that is investigatin' my railroad. I shall then return the amount to you with interest, together with that other sum which you loaned me when I left Caarter Hall."

The little lady's only reply was to slip her hand into his and kiss him on the forehead.

And yet that very morning he had turned his pockets inside out for the remains of the last dollar of the money she had given him when he left home. When it had all been raked together and its pitiable insufficiency become apparent, this dialogue took place:

"Chad, did you find any money on the flo' when you brushed my clothes?"

"No, Colonel."

"Look round on the mantelpiece; perhaps I left some bills under the clock."

"Ain't none dar, sah."

Then with that anxious look suddenly revived in his face Chad went below into the kitchen, mounted a chair, took down an old broken tea-cup from the top shelf, and poured out into his wrinkled palm a handful of small silver coin — his entire collection of tips, and all the money he had. Then he went back to the colonel with a lie in his mouth that the recording angel blotted out the moment it fell from his lips.

"Here 's some change, Marsa George, I forgot to gib ye; been left ober from de marketin'."

And the colonel gathered it all in, and went out and spent every penny of it on roses for "dear Nancy."

All of these things had acted like a tonic on the colonel, bracing him up to renewed efforts, and reacting on his guests, who in return did their best to make the breakfast a merry one.

Fitz, always delightful, was more brilliant than ever; his native wit, expressed in a brogue with verbal shadings so slight that it is hardly possible to give it in print, kept the table in a roar, while Miss Nancy, encouraged by the

ease and freedom of everybody about her, forgot for a time her quiet reserve, and was charming in the way she turned over the leaves of her own youthful experiences.

And so the talk went on until with a smile to everybody the little lady rose, called Chad, who stood ready with a shawl and a cushion, and, saying she would retire to her room until the gentlemen had finished smoking, disappeared through the doorway.

The talk had evidently aroused some memory long buried in the colonel's mind; for when Fitz had gone the dear old fellow picked up the glass holding the roses which he had given his aunt in the morning and, repeating her name softly to himself, buried his face in their fragrance. Something perhaps in their perfume stirred that haunting memory the deeper; for he suddenly raised his head and burst out:

"Ah, Major, you ought to have seen that woman forty years ago! Why, suh, she was just a rose herself!"

Then followed in disconnected scraps, as if he were recalling it to himself, with long pauses between, that story which I had heard hinted at before—a story never told the children, and never even whispered in Aunt Nancy's presence.

They had grown up together—he a tall, brown-eyed young fellow just out of the university, and she a fair-haired, joyous girl with half the county at her feet. She had not loved him at first, nor ever did until the day he had saved her life in that wild dash across country when her horse took fright, and he, riding neck and neck, had lifted her clear of her saddle. After that there had been but one pair of eyes and arms for her in the wide world. All of that spring and summer, as the colonel put it, she was like a bird pouring out her soul in one continuous song. Then there had come a night in Richmond,—the night of the ball,—followed by her sudden return home, hollow-eyed and white, and the mysterious postponement of the wedding for a year.

Everybody wondered, but no one knew, and only as the months went by did her spirits gain a little and she begin to sing once more.

It was at a great party on a neighboring estate, amid the swim of the music and the whirl of soft lace. Suddenly loud voices and threats, a shower of cards flung at a man's face, an uplifted arm caught by the host. Then a hall door thrust open and a half-frenzied man with disordered dress staggering out. Then the startled face of a young girl all in white and a cry no one ever forgot:

"O Robert! Not again?"

The long ride home in the dead of the night, Nancy alone in the coach, the escort—a distant cousin—on horseback behind.

Then the pursuit. The steady rise and fall of the hoof-beats back in the forest; the reining in of the panting horse covered with foam; the command to halt; a flash, and then that pale face stretched out in the road in the moonlight by the side of the overturned coach, the cousin bending over her with a bullet hole in his hat, and Robert, ghastly white and sobered, with the smoking pistol in his hand.

Then the long, halting procession homeward in the gray dawn.

It was not easy after this to keep the secret shut away; so one day with her arms about her uncle's neck the whole story came out. It was of that other night there in Richmond, with Robert reeling and half crazed; of his promise of reform and the postponement of the wedding while she waited and trusted: so sad a story and so hopeless that the old uncle forgot all the traditions that bound Southern families, and sustained her in her determination never to see him again.

For days the broken-hearted lover haunted the place, while an out-bound ship waited in the harbor.

Even his father, crushed and humiliated by it all, had made no intercession. But now would she see him for the last time, only that he might touch her hand and say good-by?

That last good-by took an hour, Chad walking his horse all the while before the porch door, until that tottering figure, holding to the railings and steadying itself, came down the steps.

A shutter thrown back, and Nancy at the open window watching him mount.

As he wheels he raises his hat. She pushes aside the climbing roses.

In an instant he has cleared the garden beds, and has reined in his horse just below her window-sill. Looking up into her face:

"Nancy, for the last time, shall I stay?"

She only shakes her head.

"Then look, Nancy; look! This is your work!"

There is the gleam of steel in a clenched hand, a burst of smoke, and before Chad can reach him Nancy's lover lies dead in the flowers at her feet.

It had not been an easy story for the colonel. When he ceased he passed his hand across his forehead as if the air of the room stifled him. Then laying down his pipe, he bent once more over the slender vase, his face in the roses.

"MAY I come in?"

In an instant the colonel's old manner returned.

"May you come in, Nancy? Why, you dear woman, if you had staid away five minutes longer I should have gone for you myself. What! Another skein of yarn?"

"Yes," she said, seating herself. "Hold out your hands."

The loop slipped so easily over the colonel's arms that it was quite evident that the rôle was not new to him.

"Befo' I forget it, Nancy, Mr. Fitzpatrick was called suddenly away to attend to some business connected with my railroad, and left his v'ehy kindest regards for you, and his apologies for not seein' you befo' he left."

Fitz had said nothing that resembled this, so far as his memory served me, but it was what he ought to have done, and the colonel always corrected such little slips of courtesy by supplying them himself.

"Politeness," he would sometimes say, "is becomin' rarer every day. I tell you, suh, the disease of bad manners is mo' contagious than the small-pox."

So the deception was quite natural for him.

"And what does Mr. Fitzpatrick think of the success of your enterprise, George?"

The colonel sailed away as usual with all his balloon topsails set, his elbow-room limited only by the skein, while his aunt wound her yarn silently and listened with a face expressive at once of deep interest and hope, mingled with a certain undefined doubt.

As the ball grew in size she turned to me, and, with a penetration and practical insight into affairs I had not given her credit for, began to dissect the scheme in detail. She had heard that there was lack of connecting lines and consequent absence of freight, as well as insufficient harbor facilities at Warrentown.

I parried the questions as well as I could, begging off on the plea that I was only a poor devil of a painter with a minimum knowledge of such matters, and ended by referring her to Fitz.

The colonel, much to my surprise, listened to every word without opening his lips—a silence encouraged at first by his pride that she could talk so well, and maintained thereafter because she had really awakened in his mind his first misgivings as to the ultimate success of his pet enterprise.

When she had punctured the last of his little balloons he laid his hand on her shoulder, and, looking into her face, said:

"Nancy, you really don't mean that my railroad will never be built?"

"No, George; but what will you do if it is not?"

Her thoughts were new to the colonel. Nobody except a few foolish people in the Street, anxious to sell less valuable securities and utterly unable to grasp the great merits of the

Cartersville and Warrentown Air Line Railroad plan, had ever before advanced any such ideas in his presence.

He loosened his hands from the yarn and took a seat by the window. His aunt's practical ideas had evidently so thoroughly disturbed him that for an instant I could see traces of a certain offended dignity, coupled with a nervous anxiety lest her inquiries had shaken my own confidence in his scheme. He began at once to reassure me. There was nothing to be uneasy about. Look at the bonds! Note the perfect safety of the plan of finance—the earlier coupons omitted, the subsequent peace of the investor! The peculiar location of the road, with the ancestral estates dotted along its line! The dignity of the several stations! He could hear them in his mind called out as they whistled down brakes: "Carter Hall! Barboursville! Talcott!" No; there was nothing about the road that should disturb his aunt. Then an anxious look came into his face. He began pacing the floor, buried in deep thought, with thumbs hooked behind his back. He stopped and took her hand.

"Dear Nancy, if anythin' should happen to you it would break my heart. Don't be angry, it is only the major; but yo' talk with him has so disturbed me that I am determined to secure you against personal loss."

Miss Nancy raised her eyes wonderingly. She evidently did not catch his meaning.

"You have been good enough, my dear, to advance me certain sums of money which I still owe. I want to pay these now."

"But, George, you —"

"My dearest Nancy,"—and he stooped down and kissed her cheek,— "I will have my way. Of co'se you don't mean anythin', only I cannot let another hour pass with these accounts unsettled. Think, Nancy; it is my right. The delay affects my honor."

The little lady dropped her knitting on the floor and looked at me in a helpless way.

The colonel opened the table drawer and handed me pen and ink.

"Now, Major, take this sheet of paper and draw a note of hand."

I looked at his aunt inquiringly. She nodded her head in assent.

"Yes, if it pleases George."

I began with the usual form, entering the words "I promise to pay," and stopped for instructions.

"When payable, Colonel?" I asked.

"As soon as I get the money, suh."

"But you will do that anyhow, George."

"Yes, I know, Nancy; but I want to do it now."

Then he gazed at the ceiling in deep thought.

"I have it, Major!" And the colonel seized the pen. The note read as follows:

On demand I promise to pay Ann Carter the sum of six hundred dollars, value received, with interest at the rate of six per cent. from January 1st.

Payable as soon as possible.

GEORGE FAIRFAX CARTER.

I looked to see what effect this unexpected

influx of wealth would produce on the dear lady; but the trustful smile never wavered.

She read to the very end the modest scrap of paper suddenly enriched by the colonel's signature, repeated in a whisper to herself "Payable as soon as possible," folded it with as much care as if it had been a Bank of England note, then thanked the colonel graciously, and tucked it into her reticule.

(To be continued.)

F. Hopkinson Smith.

THE RECORD OF VIRTUE: AN EXPERIMENT IN MORAL CHEMISTRY.

*Those who were
kid gloves and
put on airs have
not a heart half
so big as a poor
rough sailor*

A BRIGHT woman, full of loving-kindness and gifted with what George Herbert called "holy wit," devised not long ago a new scheme of education in the humanities. It was to establish in a newspaper in which she was interested, and which was especially devoted to philanthropic work, a department to be called the "Record of Virtue." This was intended to offset the record of crime which is so large a part of the daily newspaper, and to make another channel for curiosity higher than that which now prevails among the majority of readers, young and old. "If," says the originator of this scheme, "the newspapers, which really means, of course, the readers of news, took one-tenth part of the interest in virtue which they take in crime, our estimate of the human race would be quite different from what it now is. For it is natural, it is indeed inevitable, for us to generalize on the facts brought most prominently and constantly before our minds. If a column in our favorite paper is devoted to the description of a murder or a swindle, and two or three lines without comment to an act of heroism, the former is almost sure to make the larger figure in our average."

This first distinctive and intentional effort in journalism to let the light make prominent the good in human nature and hold the evil in shadow deserves wide mention as a hint to all who sketch human doings for the pano-

rama of the daily press. But the idea it embodies has already received unique attention in another field of social influence which should be told abroad.

Another bright woman, full of original ideas in humanitarian work, and possessed of that quick intellectual responsiveness which catches thought and passes it on in flashes of insight and sympathy, was much impressed by the "Record of Virtue." How she helped its underlying principle to further development can best be told by her own words, written to the originator of the idea:

DEAR MRS. GRANT: I write, hoping that it will give you pleasure to hear of one result of your beautiful thought in having a "Record of Virtue" in the "Journal of Women's Work." An Episcopal minister, a friend of mine, has a Sunday class of one hundred bad boys; at least they were so rough and rude that the regular Sunday-school teachers would not tolerate them and turned them out of the Sunday school. This minister, whom I will call Mr. White, told me about them and some of his original methods of civilizing them. I was much interested in the account, and it occurred to me that he might set his boys to work collecting records of praiseworthy deeds, and so I sent him a copy of your paper with the "Record of Virtue" marked, and I wrote: "How would it do to interest your one hundred bad boys in that pursuit, and offer prizes for those who could report a certain number of good, or kind, or noble deeds which they had themselves witnessed, or heard, or read about, either at the present time or in past history? . . . I feel so strongly that the right way to help is to present examples of goodness instead of picturing wickedness and vice, that I think this experiment might be worth trying. The daily papers, I believe, do much harm by their detailed and sensational reports of crimes."

Mr. White at once accepted the suggestion, and I will quote from his letters showing what he has done. He says: "I thought of your idea to-day when I saw three little fellows holding on by their toes and fingers to reach their heads above the window-sill of a school-sutler's shop to study the red police gazettes.

"Now, I will buy a valuable prize and exhibit it

next Sunday to the boys, and I will buy fifty little pass-books to be given to the larger boys, in which they may write down the ten best and noblest acts they have seen or read in the papers during the past year. Christmas week I will give a grand banquet. The boys shall sit down to a feast and at its close a song or two—some ballad of brave and noble deeds—shall be sung, followed by a reading of some noble act, after which the prize shall be brought out and awarded to the successful competitor. What do you think of my plan? I hope it will set some people thinking in a good way. I am sure you will be interested, and I will send the prize list to you. I know you are right. Last Sunday I took a big ugly fellow by the collar and dragged him out. I thought it was necessary, he was very unruly; but the look he gave me as I thrust him away set me thinking, What can I do to quicken the good in these dull boys; to overcome the evil? I am illustrating 'Pilgrim's Progress' for them now."

He goes on to say that what the neighborhood is pleased to call his "Bad Boys' School" he means to name the "Banner School."

In the next letter he says: "I inclose two slips which are pasted on the books; I have distributed fifty, but must increase the number to seventy-five. The boys take eagerly to the scheme, and I think it will be a success."

He goes on to say that the boys are very rough and rude; but he was surprised that day when one of the roughest came quietly into his study and said he would go to work if Mr. White could obtain him a place to learn a trade, for he did not wish to grow up to be like a neighbor whose name he mentioned, a man of bad character.

The slips to which he referred were as follows, on pink paper:

"ST. JAMES'
BANNER SUNDAY SCHOOL
Three Grand Prizes,
1888.

"Write in this book the ten kindest, noblest, or best acts you have read or been told. Write plainly on one side of the paper, and as short as possible, and return Christmas.

"THE PRIZES.

"*First.* Every holder of a book will be entitled to a ticket to the grand banquet when the prizes will be awarded.

"*Second.* A Waterbury watch.

"*Third.* Watch with chain.

"*Fourth.* 'St. Nicholas' for one year.

"*Fifth.* 'Wide Awake' for one year."

In the same letter he says: "It is a dreadful community in which my lot is cast; but I have one advantage: I have been here so long that I understand the ways through which the young are led astray; and if my schemes are somewhat unusual, it is because they have originated in the attempt to meet the peculiar needs of my work."

He says: "You must remember that these are not nice little boys, but outcasts from Sunday schools, and very rough and rude, and I watch the outcome of our scheme with great interest."

I will quote from one letter that I sent to Mr. White about this time: "It will be interesting to see what ideas your boys have as to what consti-

tutes a truly brave and noble action. If you can train them not to find it in warlike or showy deeds, but in acts of loving self-sacrifice often never known or recognized, in little ways of kindness and self-denial, you will do a good work. My idea is that they should be taught to love peace and all that is beautiful."

After a while he wrote: "The books are coming in. I have twenty-two now. The boys evidently have done the best they could, but some of them did not understand the requirements of the competition. But these books will be very interesting, exhibiting the idea these boys have of what is kind, noble, and good. A considerable amount of valuable discussion has been raised in the neighborhood over this novel competition. I am sure it will pay.

"It has been a great pleasure to me, and I think I am learning a lesson myself, that there is a better vantage ground for me than I have yet gained in my efforts to teach these wild boys; that it is love and kindness they need more than facts.

"As I read over these strange collections of crude ideas that these boys have brought me, I am gaining a valuable knowledge of boy life and boys' needs that I never dreamed of before. I thought I knew these boys, but I did not."

After the banquet and the awarding of the prizes Mr. White wrote me:

"I am sure you will be anxious to learn how our banquet succeeded. Miss H. sent the oysters and Mrs. P. sent the turkey. I contrived to have the boys set the long table the whole length of the hall. The fifty boys who have taken books were promptly on hand. I had a magic lantern, some music and singing for them. Miss H. was present when they all sat down to the table. They had a royal feast—oysters, turkey, and ice-cream. After dinner I called them to order, and spoke to them at some length on the subject of kindness to all, but especially to the weak. I read the books that obtained the prizes, and explained the value of the brave, kind acts in each. As once I stopped a moment I was struck with the picture. I stood on a bench at the light. Most of the boys had crowded round my feet, some had climbed into the braces and timbers above me. All were deeply intent. Even the man with the concertina I had hired to play for them stood before me, both hands still in the straps, but with his mouth wide open. I was intensely pleased that they should be so deeply interested. The first prize fell to a little boy only six years old, and when he stepped up to take his watch after his book was read he was loudly applauded. The second watch fell to a boy who had a black eye from a dreadful fight in which he had engaged. I painted it over for him with glycerin and light red. He came to see me to-night and my mother has been talking to him, and I have given him some books to read. He told me he dreamed all night that some one had stolen his watch. The books show that I was not plain and simple enough in my printed explanation.

"The plan has been received by many people with great favor, and the boys have set many of their friends searching for them to find kind and brave deeds. It has taught me invaluable knowledge and opened my eyes to lines of work I had not discovered before. I intend to go on and try the plan again, but in a different way. I will have a free entertainment for the boys, a magic lantern and a

little comedy; that night I will lecture on kindness and explain thoroughly what I want them to write, and I will distribute a great many books, and after two weeks I will have another meeting of boys, and have some more music, and read the prize books and deliver the prizes, and then try and organize a legion of boys pledged to be kind, noble, and brave."

Of his second starting of the boys on the hunt for virtues Mr. White wrote: "I read your letter to the boys, and they cheered well. And they are hard at work gathering incidents and facts for another contest. I ruled that the boys who had won the other prizes should write up the books, but were not eligible for the prizes this time. I have decided also to increase the number of prizes, and will give a small gift to every boy who completes the ten items. The banquet I hope to improve also. I am deeply interested in this work. A boy sixteen years of age was hanged in our jail for murder last summer, and now there is another of the same age who is guilty of the murder of an old woman. I deplore the result of our present educational systems. I wish I could give my whole time to humane education. I have prepared some books for a lady who teaches in the 'House of Refuge,' and she will make a trial of this scheme of getting those whom we want to make better to record virtuous and kind deeds."

Later Mr. White wrote: "I hope it will please you to know that we have held our second banquet, and that the boys cheered in their rough way for the lady who had so generously provided a treat and prizes for them. The banquet was a fine affair. We had a dinner, with ice-cream, etc., for fifty boys. After dinner I cleared the floor and let them have a good time. The prizes were awarded, and every boy was presented with a 'Band of Mercy' badge. To my surprise the first prize, a good watch, fell to a boy who last year was taken by my sexton by the scruff of the neck—a ragged, barefooted boy—and landed off the church grounds, and bade never to come back again, he was so troublesome. I learned that his father gave him a beating when he heard of it, and so I hunted him up when I gathered these banished boys at another hour. I am studying these boys: I think when the proper time comes I will draw the net and organize my 'Legion of Honor.'

"I will say that these experiments with the 'Record of Virtue' books in addition to the Sunday-school work have so gratified and encouraged me that I wish I could confine myself entirely to educational work among neglected children. I have been educated also, and have forbidden the use of coarse songs and rough quotations and slang in the little exhibitions with which I amuse my people. You must know that these are not destitute boys I labor amongst, for the most part. Their people work hard for their daily bread; but they are neglected. They are very wild and rude, and if they grow up as they are they will make very brutal husbands, and coarse, vicious fathers—just like their own fathers and grandfathers, who work almost like brute cattle. I cannot interest many even among philanthropic people in them. Some even think the boys deceive me, and I do them little real good. Perhaps even you, Miss Maxwell, would not encourage me to go on if you should hear and see them. But they come to me so confidentially and

confide in me in so many tender ways, I cannot feel about them as others do. I see in them two natures, two personalities, and even the most skeptical must admit there has been a great improvement in them. I will go on. I will organize the boys, beginning with thirty of the largest. If I could learn the best way of working with them I would make much sacrifice to try it."

That Mr. White is discovering some very good ways of working with neglected children is proved by the testimony of a leading paper in his city, which, in giving an account of a novel entertainment, an originally illustrated lecture of travel, which the clergyman gave them, says, "Already the lads, most of whom are waifs from the street, show signs of decided improvement in demeanor under the influence of the training to which they voluntarily subject themselves."

I hope, dear Mrs. Grant, you will be interested to learn how far your little candle throws its beams, and to read this long letter, and also some of the boys' books which I inclose.

Yours cordially,
HELEN MAXWELL.

Now what can be said of the books which the hands of these rude boys have inscribed with their crude ideals of virtue and kindness? They lie before this faithful chronicler, a curious testimony to the most wonderful and encouraging fact in human nature—the fact that some of the highest qualities of character can be seen and appreciated by those habituated to the lowest social conditions. The gallery gamins applaud the hero of virtue at the theater. The neglected waifs, thrust from sacred places "by the scruff of the neck," know what is meant when kindly bade to speak of noble and generous deeds. And if the eye be so keen to see the good when evil so clogs the growth towards goodness, who shall dare say that with better conditions about them these neglected children could not walk in the light they discern? If a tender, hopeful patience like Mr. White's could oftener "make channels for the streams of love" and sweeten the currents of social influence for these rude boys, perhaps even the coarse and brutal fathers would not hold them always to vicious ways. It may seem odd that a boy fresh from a street fight, with black eye painted over for the occasion, should take a prize for the recital of kind acts; but that such a boy should be able to tell so well what virtue is shows a misguided or undeveloped moral power which witnesses more strongly to the divinity of human nature than all the perfections of the better born and bred.

Two of the boys did mistake utterly the meaning of Mr. White's directions respecting the record-books, and offered a list of murders, thefts, fires, and calamities copied from the crimes and casualty column of the daily press; and several gave a collection of remarkable

facts and quotations of no moral significance in the line required. Quite a number of boys seemed to think nothing sacred enough for the books but Scripture texts and narratives of Bible heroes. One devoted to scriptural subjects evidently believed that "brevity is the soul of wit," and summed up his required items in the following single sentence: "The ten commandments." One biblical book is sufficiently remarkable for partial quotation; quotations in this case, as in all others, being verbatim as to spelling and punctuation, or the lack of it.

Jacob was very kind his brothers sold him and when his brothers wer in neede he took them in his home.

David was a brave man he killed Goliath whit a sling

Simson killed 1000 people with a mule jaw boon and he pulled a lion jaw into

*Simson Killed 1000
people with a
mule jaw boon
and he pulled a
lion jaw into*

Daniel was a brave man he was in by 7 lion.

The seven jews brothers was brave and there mother the were killed be thy would not eat pork.

Several boys made collections of poetry, some of which was quite irrelevant in character, ranging from "Gentle Jesus, Meek and Mild" to "Little Boy Blue" and "The Boy Stood on the Burning Deck," and some of which was of a stately and sentimental order; in a few cases a poetic version of some heroic deed. One boy, in a curious medley of verse and prose, quotes two stanzas of what is evidently a stirring ballad of brave action as follows:

(1) A sea faces upward turn, one fear by every heart inured by ruddy light is clearly read in every brow the anxious dread a mother mid the bright light stands her necktie clasped by baby hands.

(2) Mid the lurid light for a moment loss then dimly seen as it gleams on the sight her curling wreath of smoke between up the ladder one rushes but three come down and the helm is a heroes crown.

The same boy has for his tenth item the following mixture of pertinent suggestion and reassuring sentiment:

Who misses or who wins the prize to lose or conquer as you can

But if you fail or if you rise be each pray God a gentleman.

VOL. XLI.—32.

Yet do not think I doubt thee I know thy truth remains I would not live without thee for all the words contains.

Several books are historical and political in tendency. Robinson Crusoe and Christopher Columbus divide honors as discoverers, and the latter receives one quite remarkable recognition in the following entry:

Christopher Columbus going on a voyage to discover unknown lands so as to spread the gospel to the heathens to save their immortal souls.

Arnold von Winkelried and other true heroes appear in the narratives; and Abraham Lincoln is mentioned by several of the boys for "his kind act the emancipation proclamation." George Washington is praised both for his devotion to his country in the revolutionary times, and for, as one boy puts it, "admitting that he did it with his little hatchet."

One boy proceeds in so orderly and accurate a manner that his book is very impressive with its array of dates and its dignified items of national and universal importance. His first item is "The Discovery of America"; his second, "The Landing of the Mayflower"; his third, "The motion in Congress that the American Colonies were and of right ought to be free and independent"; his fourth, "The Emancipation Proclamation"; and his fifth, the surrender of Lee, "therby puttin an end to the great Rebellion." And then he takes up religious history, beginning with "Martin Luther," and ending his book with the following summary:

But the greatest and kindest act was when Jesus Christ died on the Cross so that our sins might be forgiven.

Another boy of apparently the same statistical and methodical order of mind puts in, between a recognition of the "Holy Martyrs" and of recent contributions by the citizens of his town for sufferers by a great fire, the following bit of home gratitude:

Our pastor giving his time and energy towards teaching and amusing our little ones.

Another boy of similar historic turn adds a dramatic touch to his recital of facts, and asks, *à la* Carlyle:

Who is the man in America that is not proud of the name of Bengimin Franklin who chained the lightning from the heaven and Franklin P. Morse that made the same subservan to man will.

One boy evidently thinks it is a prophecy of better things and a promise of better life which is wanted, rather than a record of facts,

and he begins with his suggestions of improvement as follows:

The first kind act i think wold be if some of our rich people wold take some of thare spare money and give it to St. James Church.

It will be observed that this reformer starts in his scheme for bettering the world where so many others do, in an easy mental disposition of other people's surplus funds. This same boy closes his contribution with these reflections, in which the peculiar spelling emphatically points the moral:

We all must mind our pastor and teacher and be *yousfull* in this world. Merry Christmas to you all.

One boy has evidently been impressed with the rhythm of the Church service, and has unconsciously patterned his book upon its stately form. He enumerates important events, beginning with "The election of Harrison and Morton as President and Vice President of the United States"; and for his sixth item, following a formal statement of congressional action, makes this pathetic entry:

The loss by death of my little brother.

Death has, it is clear, impressed the little fellow as a stupendous thing, to be classed with great public events when he makes up a solemn book to show to a clergyman; and then he goes on to enumerate causes for thankfulness as follows:

For the great yield of our crops the past year

For the health of our people of —

And to God for the preservation of my father and mother.

Another boy, apparently of the same mind respecting the sort of entry required by Mr. White, begins, "The first and best thing I have read is the Bible"; has for his eighth item, "The best for mankind was Christ dying to save us"; and closes with:

ioth the last but not the least was the kind act of the lady who offered us boys the prizes if we should win.

A very good number fill the requirements as regards the topic better than those yet mentioned; and of these a fair proportion fill out the ten items. One curious difference appears in these records of virtue that are nearest the ideas of Miss Maxwell and Mr. White. Some boys start out ambitiously and with an evident desire to copy exactly something they have read, or give an elaborate recital of something they have heard in the required line; and a

few keep up the interest and energy long enough fully to accomplish their purpose. But of those who grow weary, some come to an abrupt stop, with no attempt to condense the story to preserve its pith, while others make a very good synopsis, and so give the picture even if it is blurred. An instance of the former is the following item:

George Washington, who was the leader of the American armies wished very much to find out the positions of the American [English?] army and just how strong it was.

Here the account ends. The boy evidently began the story of the young man whom Washington sent as a spy into the English lines, and who was shot by the enemy, and whom Washington so mourned for his bravery and promise.

On the other hand, several of the boys show real ability in their brief and pithy sentences, as the following indicate:

There was an old woman who was sick and blind and a little girl read the Bible to her.

One cold night it happened that a bridge burned and a small girl managed to crawl over to save the train which was to cross the bridge that night she got over to build a fire around the bend the train come the engineer noticed the fire gave alarm to the people they got out of the car and kissed the girl for her braveness.

About 5 years ago there was a man who had a brave dog who saved 2 bodies from a fire when the firemen were afraid to go in but the dog was not the dog ran in got an old lady and dragged her out running in again looking all over and found a little baby he dragged her out and there wer both saved by this brave dog. The dog is dead now he died about a year ago.

I heard of a brave engineer who was running a locomotive it happened one day when he was running the locomotive that a horse and carriage with two girls were near the track when the engineer jumped from the engine into the carriage and stopped the horse and saved them all.

There was a man standing by the gate and a boy passed and snapped a cherry stone into the man's eye and put his eye out the man planted the stone ten year passed and a hungry tramp come along and the man told him to go up in the cherry tree and eat some cherries it was the same boy who put his eye out.

One boy is of a strikingly dramatic turn. He dashes into the heart of his stories without a word of preliminary explanation, after the style of the bold novelist whose forte is plot and thrilling climax. One of his items is as follows:

Brave Toby! The house was on fire and no one thought of poor puss. All were too busy sav-

ing themselves. No one: yes: Toby, missing his companion actually ran into the burning house and presently came downstairs holding poor puss safe and sound in his mouth wasnt he brave and didnt he deserve the shout of

Bravo!

Another runs in this wise:

Will he succeeded

The man has fallen over broad and in his struggles caught hold of a great sea bird swimming on the water. The bird tries to escape and the man hopes, by its means, to raise himself above the waves. Will he succeed? we hope so for it is sad to be drowned.

I think the bird is an albatross.

And again this boy celebrates the good deeds of the dumb creatures by a striking tale which we quote:

A few years ago in the city of New York thier was a brave polly who saved a man and woman in this way burgallers entry the house and stole the money and then one burgallers said to another we 'll shot 'em! Now the Polly hearing this rang the alarm which woke his master up and then the burgallers escaped and a few years after the polly die and was mourn by many people and he was buried in a coffin cost three hundred dollar

Brave Polly!

Some of the boys who failed to complete the number of items seem to have had a very good idea of the sort of incident required. As, for instance, the following three narratives show that if the boy who wrote these in his book had only persevered he might have made an excellent record:

I read in a book a story of a girl who was very brave her father was General Schuyler and he was in the Revolutionary War. One day the Tories and Indians came to his house to capture him he went up stairs and took his family with him but when they were all together in a dark room the mother remembered that the little baby was asleep in its cradle down stairs she was going for it-but the General said no I will go while they were talking their little girl ran down stairs and got the baby. The Indians tried to tomahawk at her but she ran so fast that it did not hit her, and she carried the baby to her mother.

There was a little boy scating on the ice in Toledo the ice broke and he fell in his dog was watching and jumped in and saved him this I call a brave act.

There was an engineer saw a little child sitting on the tracks and his engine was almost to her and he could not stop it so he walked out on the frund of engine and picked her up and by doing so saved her life.

Another boy who failed to complete his book showed an understanding of true nobil-

ity and kindness by his quotation of the following among other incidents:

Not long ago some boys wer flying a kite in the street just as a poor boy on horse-back rode by. The horse became frightened and threw the boy injuring him severely. None of the boys followed but one that witnesses it did. He found that the wounded boy was the grandson of a poor widow whose only support consisted in selling milk. The boy said to the old lady I can drive your cow. He also gave her some money he had saved for a pair of boots to buy medicine and wore a pair of boots that belonged to the sick boy.

A girl while going to school was abused by an older girl. Day and after day she would throw snow at her. So one day she told her mother and her mother told her to pick out the nicest apple she could find and the next day to give it to this girl. So she did and after that she never hurt her again.

Considering that we are quoting from the collections of "little outlaws," it is somewhat surprising to come upon a choice like this, with which one boy begins his book:

Like one who leaves the trampled street for some Cathedral cool and dim where he can hear in music beat the heart of prayer that beats for him.

One little boy only six years old had evidently received help in the preparation of his book, and was of different home surroundings and training from the others. His book is very interesting, both from the quaint and original incidents given, and also from one narrative which betrays the author's desire to include himself among his list of heroes. Like many an older chronicler he took pains that history should do him justice, but showed an adroit avoidance of direct self-praise worthy of imitation.

Some very bad boys tied an old tin can to a little black dog's tail, and he was afraid, but a *little* boy who was good caught the dog and got the can untied so the little dog did not cry any more. That little boy was brave. I am a little boy only six years old and I am afraid of *big bad* boys.

Another item given by this little boy leads us to exclaim, "Wonderful if true!"

A nice fat hen died one day, and her little chicks did not have any place to go: but a *big big* rooster walked up to them, and took them with him; and he scratched in the dirt for them, and let them sleep under his feathers at night, so they all lived to be fat hens. I think that was a *very* kind act.

One of the best collections contains the following incidents of self-sacrifice and devotion to others:

A true nobleman wounded on the field of Zutphen Sir Philip Sidney refused to quenceh his burning thirst till he had offered his canteen to a poor bleeding soldier.

When the gallant Sir Ralph Abercrombie was mortally wounded in the battle of Aboukir they carried him on a litter on board of his ship and to ease his pain a soldier's blanket was placed under his head from which he experienced considerable relief. He asked what it was. It's only a soldier's blanket they replied. Who's blanket is it asked Sir Ralph, I wish to know the name of the man whose blanket this is. It is Duncan Roy's of the Forty-second Sir Ralph. Then see that Duncan Roy gets his blanket this very night. Even to ease his dying agony the general would not deprive the private soldier of his blanket for one night.

A slaves revenge.

Some years ago a poor negro bought as a slave on the coast of Africa was carried to the West Indies. His master, a wealthy planter found him faithful and showed great confidence in him and employed him in affairs of importance. One day the planter wished to purchase twenty more slaves. He went to market with his faithful Peter and told him to choose those he thought would make the best workmen. To his surprise Peter chose among others a decrepid old man. On the plantation Peter took the greatest care of the old man. He was as careful of him as a good son could be of a beloved father. The master was surprised at Peter's conduct towards his fellow slave, and wished to know the reason for it. Is he your father? he asked. No master. Perhaps he is an older brother? No master he is not. He must be some relative. It cannot be that you should care so much for a total stranger. He is not a stranger to me master though not a relative, he is my enemy. It is he that sold me on the coast of Africa. But I must not hate him for that. A missionary taught me if thy enemy be hungry give him eat : if he thirst give him to drink. I try to follow that law of our master in heaven.

Another boy, whose collection of items is excellent, begins with one which shows he was able to discern the worth of little simple acts which any boy might do.

One cold morning last winter the streets were slippery with a thin coat of ice, partially covered with snow, and people who were going to their places of business were obliged to walk very carefully for fear of falling. As I was passing along with the rest I noticed a bright looking lad standing on the pavement, and steadily looking at a spot on the sidewalk. As I approached him he looked up at me and pointed to the place said, "please don't step there, I slipped there and fell." I thanked the kind and thoughtful little fellow and passed by the dangerous place.

Perhaps the most remarkable book in its indications of originality in quotations, and native intellectual power in the boy whose name it bears, is one beginning with the following significant moral reflections :

If you do not begin you will never come to the end the first weed pulled up in the garden the first seed put in the ground the first [dollar?] put in the bank the first mile braved on a journey are all important things they make a beginning and

give promes a hope an assurance that you are in earnest in what you have undertaken. How many a poor idle erring hesitating outcast is now creeping his way through the world who might have held up his head and prospered if instead of putting off his resolutions amendment and industry he had only made a

Beginnning.

Two incidents given by this boy deserve full quotation.

A traveling jew by the name of Simon come into Germany and been very tired went to a tavern and began to sleep when a soapmake set fire to his beard Simon woke up and put it out and then he went to bed and slept when in the night he heard to fire bell ring he got and dress and went to the fire when he got there it was the same soapmakers house on fire and his wife and child in danger and no one ventured to rescue then Simon went in and save the wife and child and the soapmake call on Simon next morning but he was gone but he left the soapmake enough money to build his house again.

On a small path at the right was a high mountain in on the left a deep and swift river went a wery wander [wanderer] as a tiger came bounding down the path towards him he was about to jump into the river but there was a crocodile he expected would kill him the tiger had but a few steps more and came leापen instead of on the man he leaped into the river in reach of the crocodile and traveler escaped do not get discouraged till the last moment it may turn out to

your good

It is time for this chronicler to finish with the sentence which one boy gives at the close of his book : "This ends my compositions."

But a little should be added concerning the books of the second competition. These had pasted on the cover the following printed announcement :

ST. JAMES' BANNER SUNDAY SCHOOL'S
Second Grand
Prize Banquet.

Write plainly in this book ten of the kindest, bravest, and noblest acts you have read, seen, or been told.

The design of this competition is to teach you to seek for and to love that which is kind, gentle, and brave, and to shun and hate those things which are base, ignoble, and wrong.

On the back of the book appeared the description of the

GRAND PRIZES.

First. A good watch and chain.

Second. A good watch.

Third. "St. Nicholas" for one year.

Fourth. "Wide Awake" for one year.

Fifth. For every boy who writes ten acts a Band of Mercy pin and a ticket to the grand banquet, when the prizes will be awarded.

The second set of books is an advance upon the first in understanding of the intention of Mr. White, in neatness, in accuracy, and in the proportion of those having the full number of items. In some instances the same boys tried again, and improved decidedly upon their original work, although knowing that they could not get a prize if they had before received one.

The far greater number of kind acts done by humble people in everyday fashion which are recorded in the second set of books show that the boys had at last understood that they were asked to note that which touched or might affect their own lives closely, and not merely to search history for sublime deeds of great men. One records the following:

One day as two boys were walking along they met a poor old woman carrying a large basket of apples she looked weak and ill so the lads carried the basket a long distance and they would not take an apple because it was their duty.

Another tells this:

A little boy named Arty said to a boy named Frank Green you 're the rudest boy in this street I should think you be ashamed Frank had a new snowball all ready to strike the poor old woman who had just returned from a hard days work. But when Frank herd those words he drew back his hand. He look angry and Harry said I dont see how you dare to tell Frank that he pay you off for it. Well I'd rather he'd pay me off than do a rude thing. Dont you think Arty was brave? I do and I think some day he will be a true gentleman.

Another boy, whose whole collection is very good, tells of the heroism of a little drummer boy who refused a glass of wine at the dinner-table of his captain, although urged and commanded to drink it. Another boy repeats the pretty story of the English sailor who, released from his captivity as a prisoner of war, bought of a bird dealer a cage full of birds and gave them their freedom in gratitude for his own newly regained liberty.

The whole collection of books given in at this second contest shows much moral discrimination, and many incidents recorded touch upon those finer and more delicate elements of kindness and nobility which the boys could hardly have seen much of in their homes. The following is one of the best:

THE NOBLE HEARTED BOY.

Just in the rear of a pleasant village in which i once lived is a long hill and in the winter time the

children used to come there to coast on their sleds especially on Saturdays when there was no School. One morning a large number of merry boys had collected as usual on the hill and they were enjoying the sport making the air ring with their glad shouts. But at the top of the hill stood a little fellow by himself watching the other boys intently but taking no part in the sport. He seemed to be a poor boy for he was dressed in a large ragged coat and he had an old handkerchief tied over his cap apparently to keep it on his head. as he moved forward to look after the boys who were descending the hill on their sleds i observed also that he was lame. No one seemed to take any notice of him for a long time except once when a mischievous boy threw a snow ball at him he was indeed a stranger in the crowd and my heart began to ache for him he looked so sad and lonesome standing there by himself unable to participate in the enjoyment which he saw around him and with no one to give him a kindly greeting. Presently however a bright looking lad left his mates and approached the solitary friendless boy i could not hear what he said but i soon saw him help the poor lame boy to a seat on his sled and down the long slope they both went together. The attention of the other boys seemed then to be drawn to the pair and as they reached the foot of the hill they all gave a loud hurrah seeming to understand what their playmate had done. Then catching the same spirit which he had shown they ran to the spot and four or five sturdy little fellows took hold of the rope and drew the sled up the hill with the lame boy sitting upon it. Then they gave him another slide down the hill and another up and no one among them all had a merrier time than he who a few minutes before had been as an outcast among them. That was a beautiful sight. The lad who had the disposition and courage to do such a deed of kindness and influence enough to make the rest of his playmates follow his example must have been indeed a noble hearted boy and a happy one too.

Not all cities have a Miss Maxwell to start this novel experiment in training rudeness, coarseness, and brutality to fix the eye upon gentleness, nobility, and kindness. Fewer cities still have a Mr. White, of devotion, tenderness, and faith to draw the hearts of the most depraved and wayward towards the better life. But the principle of this unique enterprise in moral training is of universal application — the principle that attractive power towards the good rather than repressive power towards the bad is the mighty lever in character-building.

The great interest already manifested in this boys' "Record of Virtue," wherever it has been known, justifies this public recital of a most private and personal work, while it gives hope of new and wiser ventures in the same direction.

Anna Garlin Spencer.

A PAIR OF OLD BOYS.

It was the 19th of May in early morning. On the slender currents of air the crowing of cocks and the lowing of cattle were borne from distance to distance through mists of evaporating dew.

The sky, like a vast inverted deep-water sea, was almost green-blue by the effect of reflection from the verdure of woods and fields. In all the orchards the orioles were warbling a sort of counterpoint to the brilliant airs of the brown thrushes. Morning it was, like the morning of life, pure, vivid, exhilarating. To breathe was to inhale nameless thrills, perfumes, dreams; to see was to entertain indescribable apparitions of beauty; to hear was to revel in a broad, tender, softly flowing tide of melody; merely to exist gave a sense of blending with nature at the ecstatic culmination of her most perfect mood.

The red clover was blooming, and the meadow-larks were amid its tufts, their breasts flashing like gold. A honeydew sweetness suffused all things, and as Grandfather Hart came forth from the doorway of his comfortable farm-house he straightened himself up, as if, with a little shrug of his shoulders, to adjust the load of his eighty-two years. In his shriveled, knotty right hand he bore a curiously distorted stick, the stem of a young hickory tree that had been forced into a screw-like growth by a spiral vine. For thirty years he had carried this cane; it seemed to have taken the place, in a measure, of the wife who long ago used to walk with him, before she went to lie in the little churchyard burying-ground.

Grandfather Hart wore his soft felt hat far back, so that the thin, long locks of white hair could tumble over his broad forehead. His smooth-shaven face was gentle, good-humored, and benevolent in expression, with an air of dignity that was not well sustained by his undersized stature.

Coming out into the morning he pulled himself up from his habitual stoop, pushed his hat a little farther back, and drew in a long, deep breath of the fragrant air. Looking this way and that for a while, as one does who has no fixed purpose in mind, he walked slowly towards the little front gate that gave upon the

highway. He plucked a spray of hyacinths as he passed down the walk, smelt them, and placed them in his buttonhole.

When he found himself in the dry but scarcely dusty highway he stood hesitating again. Evidently he would as lief go one way as the other. He had not observed Abram Hines coming across the clover field, nor had he yet seen him when, perched upon the fence just across the road, that lifelong friend, in a voice somewhat cracked, called out:

"Mornin', Dave."

"Well, well! He, he, he! Mornin', Abe. Did n't see ye till ye spoke."

Abram Hines was seven months and seven days older than David Hart. The two had been neighbors and friends from earliest childhood. Their farms, broad and fertile, lay side by side; their children had intermarried; in politics and in religion they agreed perfectly; they subscribed for the same agricultural journal; in their young days they used to swap work; all their lives they had been to each other simply Dave and Abe.

Abe was taller than Dave, and had a firmer, shrewder face; besides, he was stronger and more agile.

"D'ye hear them meader-larks?" inquired Abe, after he had descended from the fence-top and they had shaken hands.

"Yes; I hearn 'em afore breakfast," said Dave.

"Which a-way were ye a-goin'?"

"Oh, jest thought I'd knock around a little. Mighty poorty mornin'."

"Mighty poorty, mighty."

They walked aimlessly along the road, shambling and shuffling gingerly, as old men do, until they reached a place where on one side of the road was a field of rye and on the other a grassy hillside covered with wide-spreading maple trees and sloping down to a deep, narrow, blue mill-pond.

The spring had been warm, forcing vegetation; the rye was waist-high to a man. What was it, whence came it, this something that just then stole through the air? Was it a perfume from the rye, or was it a waft from the riant leafage of the wood?

"Don't ye 'member, Abe, when we's little fellers, how we fooled the Joneses right here that Sunday?"

"Well, Dave! I was jest goin' to say them very words!"

A little woodpecker pounding away on a

dead bough hard by gave forth a familiar, far-reaching, retrospective sound, as if it were pecking seventy years ago. The cooing of a dove came from a morning grove of boyhood.

"That was powerful fun, Abe."

"Was n't it, though!"

The two old men stood still in the road, and gazed into each other's sunken and rheumy eyes. A sort of radiance, like the remote flash of an irresistible boyish mood, shimmered through their wrinkles. A catbird sang in a thorn tree; bluebirds floated from stake to stake of the fences, warbling and fluttering so that they looked like flakes of painted music tossed on the waves of the morning-tide; and up from the little hollow of the wood swelled the sound of the mill-stream pouring over the dam.

"I feel awful well this mornin'," said Dave, taking off his hat and rubbing his white hair.

"So do I," said Abe. "I feel most like a boy. Seems like I could mighty nigh jump that fence."

They stood there and chuckled at each other in a rattling raucous, falsetto strain, showing some long yellow snags of teeth. Dave swung his cane, and protruded his tongue just a little. Their faces were beginning to show a faint glow of red. A large piece of brown paper that some passer had flung aside was blown down the road, and to it clung a white wrapping thread.

"That might skeer a horse," said Dave, stopping it with his foot as it tumbled along.

"Looks like it might 'a' been here sence we fooled the Joneses," remarked Abe, still chuckling retrospectively.

The two old, wrinkled, tottering men looked again into each other's eyes, and both half recoiled with a sheepish timidity. A common thought had thrilled and abashed them. Dave looked up the road; Abe cast a furtive glance down it. The sun, now getting well above the eastern trees, glorified the twain with a warm, golden glow. Abe's old hat was awry.

"Hurry, Abe; let's do it!" exclaimed Dave in a half-whisper.

Dave stooped with some difficulty and took up the paper and string. Abe scrambled for a boulder that would weigh about four pounds.

"This here 'll do," he said; "wrap it up nice, Dave, so it 'll look like a dollar's wo'th o' coffee."

Very soon they had made a squarish package, well tied up, which they placed in the middle of the road, with many a hurried, half-frightened glance this way and that.

Then it was surprising to see how nimbly they climbed over the fence into the rye, where they hid themselves, still tittering and chuckling. As they squatted low to cover them-

selves with the luxuriant blades and stalks Dave whispered:

"B'lieve I hear a buggy comin'."

At that moment two quails flew up close by and rushed away through the air with a loud, sudden noise.

"Lordy massy! How that scared me!" said Abe.

"Be still," said Dave; "for I jest do hear a buggy or somethin' a-comin'."

Sure enough the clatter of a rickety spring wagon and the measured jog-trot of a horse reached their ears. They pressed close together as they craned their skinny old necks and peered out of the fragrant rye.

Young farmer Jones, grandson of the old Joneses, came driving along with his wife and little girl, going to the village. They were all on one seat of the little wabbling wagon.

"That 's sich a sweet child," whispered Abe.

"Jest like my Sairy used to be," responded Dave.

"Whoa-erp!" called farmer Jones to his sturdy horse, at the same time bringing him up short.

"What 's the matter?" inquired his wife.

The little girl pitched forward and came near falling, her long, shining, curly yellow hair tumbling over her cheeks.

"Hold them lines a minute; there 's somethin' in the road," remarked Jones, handing the guiding-reins to his wife.

He got out and picked up the package and climbed into the wagon with it.

"It 's heavy," he said. "Wonder what it is?"

His wife grabbed at it, out of sudden, uncontrollable, womanly curiosity. He dropped it and it fell upon his toe.

"Confound it!" he bawled. "Confound the everlasting thing! Con—"

He was wringing himself about and trying to get his foot in his hand, when a mighty cackling and giggling began just over the fence and he saw two white heads bob up out of the rye and two wrinkled faces, all distorted with delight, were turned upon him.

"Confound you! Confound you!" he fairly shrieked, seizing the boulder, which had partly burst from the paper, and heaving it at them with all his might. It fell short as the old men dodged down into the rye and were lost to view.

Young farmer Jones glared for a moment, then drove on.

"Oh! oh! o-o-h!" ejaculated the old sinners, laughing till they had to hold their abdomens; and writhing in the sweet, yielding cover, as they hung to each other with a pressure of shoulder to shoulder, they enjoyed a

wild paroxysm such as comes to hysterically happy children. Never before had they felt such perfectly satisfying and furthestmost reaching mirth. They laughed till the tears bubbled over their sear cheeks and dripped from their shriveled chins. At length they lay down side by side, panting, almost exhausted, and gazed up at the royal glory of the sky. Two great hen-hawks were wheeling slowly around, so high that they appeared to slide against the smooth substance of heaven. Very far off sounded the dreamy crowing of the cocks and the soft lowing of the cows.

"Was n't it scrutiatin', Abe?"

"Oh-oh-o-o-oh!" ejaculated Abe. Then they laughed again, rolling over and over in the rye, their stiffened and attenuated limbs bent at comically acute angles, like the elbows of grasshoppers.

Presently they picked up their hats and climbed up on the fence, where they sat, looking for all the world like two starved but happily expectant wizards discussing a subtle charm.

"Let's do it ag'in," suggested Abe. But they found that the paper was hopelessly torn.

"Bring along the boulder," said Dave, picking up the string; "we may find another paper some'eres in the road."

"Boulders is as plenty as papers," responded Abe. "No need to lug it along."

Side by side again in the dry, and along here somewhat dusty, highway they shambled stiffly, bursting into a fit of chuckling now and then, until they passed a sharp turn. Suddenly Dave was reminded that he had left his cane where they had hidden themselves in the rye.

"Go git it an' hurry back 'fore somebody comes along," said Abe. Dave did not wait to be told twice, but went back as fast as he could. Abe looked after him as he toddled along, shuffling up little puffs of the thin, light dust until he was lost around the turn.

"The same old Dave he allus was," he gently murmured. "Got more fun into 'im 'an a monkey."

The place where they had rolled and tumbled in the rye was not hard to find; but Dave looked in vain for his distorted stick. He tramped round and round; what could have become of it? That dear old staff, which had been his support for so many long years, how could he bear to lose it? A feeling of sadness began to steal over him. Suddenly he saw it lying right there in plain view. He must have stepped over it a dozen times during the protracted search. How light and happy he felt when he picked it up and turned to go back to where Abe was waiting for him!

"Dear old Abe," he thought, "what a

funny fellow he is! Him a-cuttin' up and doin' sech foolin' at his time o' life!"

The currents of the air had combined into a gently pouring breeze; the sun was mounting rapidly and deepening the splendor of the sky; mysterious silken sounds crept through the rye and wandered on high among the tree-tops.

Dave thumped the ground with his cane as he went along towards the bend in the road behind which Abe was waiting for him. He walked fast, blowing a little and mopping his face with his red-flowered handkerchief. How eager he was to resume once more their sport! It was as if he feared the mood might vanish before he could get back. When he rounded the turn a brown thrush was singing in a wild crab-apple tree at the edge of the woods, and somehow there was a doleful strain in its lay.

Where was Abe? Dave stood still and looked around. Suddenly there came a strange dullness into the sunshine. In the middle of the road lay Abe's old hat trampled and torn; there were deep marks of a violent struggle, and a sort of broad, shallow furrow where a heavy body had been dragged down through a thicket towards the mill-pond. Abe's greasy leather pocketbook, rifled of its contents, had been flung aside just yonder. A heavy club lay near, and close by it fluttered in the breeze a scrap of the hat's soiled lining.

Weak and sick at heart, the whole painted, sunny, shimmering world whirling round him, Dave leaned on his staff and wavered to and fro, quivering like a dry leaf. He could not think; his mind was numb; his heart lay in his throat choking him, while in his ears were noises dull and terrible.

Young farmer Jones with his wife and child, driving back from the village, found him standing thus.

"Hello! What's the matter?"

The spring wagon stopped, and Jones alighted. Poor old Dave could do nothing but point dumbly at the hat and the club. Jones stared around.

"What does this mean?" he demanded, and he turned pale.

"Abe, Abe—it's Abe that somebody has killed!" wailed the shaking old man when presently he found his voice. "They've robbed him; they've dragged him yonder!"

He pointed along the track into the thicket towards the mill-pond. Jones picked up the club and started in that direction, the old man tottering at his heels. There was no fence on that side of the road, but the hazel and papaw bushes were all tangled together, making their progress slow. The catbirds scolded them as they stumbled along, and now and again they heard the peculiar long-drawn sigh of a

"LET 'S DO IT AG'IN."

brown thrush in the verdurous meshes of wild vines.

Deep in the thicket lay a large mossy log half sunken in the ground; to this the track led them. On top the moss was dragged off, so that the rotten wood showed its red-brown fiberless substance freshly torn and creased. They approached it, and on the other side, all cramped and crumpled, crushed together as it were, lay the form of Abe.

Dave sank down and lay crosswise on the mossy and damp trunk, gazing helplessly. Jones stepped over and stooped low, reaching to take hold of the poor twisted body.

Then up rose Abe to a sitting posture and broke forth with such a rattling burst of laughter that every bird in the woods was frightened into silence. Jones leaped backward and grunted, as if he had been hit in the stomach, while poor Dave turned as white as a ghost.

Abe held his lank sides, and, bending to and fro, fairly lost himself in atrocious grimaces and laughter, until he had to leave off, being exhausted.

Now there was a while of silence, at the end of which Dave held up a knotty, emaciated hand, and exclaimed:

"Well, Abe, you old scamp!"

Jones threw aside the club with savage energy, muttering as he went back towards the road:

"You 're two of the confoundest, dad-blasted old eejits that ever was!"

An hour later Dave and Abe parted, each walking gingerly and slowly towards his home.

On the next Sunday, when they met at the little meeting-house, they looked sheepishly at each other and said simply:

"How d' ye do?"

They never played again.

Maurice Thompson.

RENEWAL.

OUT of the night,
Out of the vast and vacant blue
Where the hidden world takes form anew,
Glimmers a gathering light.

The bud of the dawn
In the empty field of shadow glows,
Grows and glows like an opening rose,
And the night is over and gone!

And the heart is high
For the swelling green of the mountain crest,
For the music that sleeps in the robin's nest,
And the rose of the eastern sky!

Kate Putnam Osgood.

THE BORDER-LAND OF CHINA.

A JOURNEY THROUGH AN UNKNOWN LAND.

DRUM MADE OF HUMAN SKULLS.

HARDLY had we lost sight of Hsi-ning on our way to the great Kumbum lamasery than we seemed to have suddenly left China and its people far behind, so great were the changes that everywhere met us. No longer were all the passers-by blue-gowned and long-queued Chinese, but people of different language and different dress. There were Mongols, some of them from Urga near Kiakhta or the remote Amoor provinces, dressed in greasy sheepskin gowns and big fur caps, or else in the yellow or red cloth ones of lamas. The women were hardly distinguishable from the men save those who, from coquetry, had put on their green satin gowns and head and neck ornaments of silver, so as to produce a sensation on entering Lusal, the suburb of Kumbum. With them were long strings of camels, many of them bearing

gifts, sometimes of great value, for the temple. Then came parties of pilgrims tramping along in single file, each with a little load held by a light wooden frame fastened to his back. They belonged to some one of the Tibetan tribes that live in the mountains of the Hsi-ning circuit, and are known to the Chinese as Hsi-Fan, "Western barbarians or borderers," or simply Fantzu.¹ Many other queer people we saw as we rode along, T'u-ssu and K'amba, Panak'a and Salar, of all of whom I shall have to speak later.

Our road led up a valley, towards a high black range of nude and jagged peaks, rising like a wall across its southern extremity, and which figures on our maps as the South Kokonor range. When about fifteen miles up we turned to the southwest, and crossing the low hills which here border it, we saw in the narrow valley of loess formation lying at our feet a straggling village built on the steep sides of a hill at the foot of which two small streams met. Here was a grove of slender poplars black with flocks of croaking ravens and small, yellow-billed crows, while shaggy, grunting yaks, camels with gurgling moans, and little rough ponies led by their queer, un-Chinese looking owners drank in the stream close by. On the flat roofs of the village houses sat men and women gossiping, spinning yarn, or spreading out manure to dry. This was Lusal, the suburb, as it were, of Kumbum. As I stood on top of the hill leading down to the village I looked to my left and there were the golden roofs and spires of the temples with walls of green or red, and over the hillside roundabout were long, irregular lines of low, flat-roofed houses, partly hidden behind clean whitewashed walls, the homes of three thousand odd lamas who live in this great sanctuary of the Tibetan and Mongol faith. On the hill slope between the village and the lamasery was the fair-ground, where a motley crowd was moving to and fro, where droves of yaks and strings of camels were continually arriving, while scattered about farther away were the traveling tents of those who preferred their ordinary dwellings to the small, dingy rooms to be rented in the lamasery or at Lusal.

It was the day after my arrival at Lusal,

¹ The Mongols call them Tangutu; but the name they give themselves is Bopa, a local pronunciation of the Tibetan word Bodpa, the generic name of all Tibetans, and pronounced in Central Tibet as if written Peu-ba.

the twelfth of the first moon, when the Chinese in every town and village all over the Empire celebrate the Dragon festival (*lung-tung hui*),¹ that I made my first acquaintance with the place. The streets of the village were crowded with people dressed in their holiday best, and all pressing on towards the Chinese temple at the foot of the hill where the feast was to begin. The theatrical representation was without interest, but the spectators were delightful. On one side were squatting a group

glass beads. The day was warm and the men and women had slipped their right arms out of their gowns, showing their bronzed and muscular forms undefiled by any acquaintance with water, to say nothing of soap.

Near them stood some T'u-szu in dress closely resembling the Chinese, only they wore their gowns short and full in Tibetan fashion; the women with bright red handkerchiefs around their heads, and long violet gowns of Chinese pattern.

KUMBUM.

of Rongwa Tibetan men and women in high-collared sheepskin or cloth gowns trimmed with leopard skins. On their heads were little pointed red caps with lambskin borders, or dark red turbans draped in loose but graceful folds. The women dressed like the men except that their hair fell from under their little caps over their shoulders and backs in numberless small plaits like cloaks, the plaits held together by broad bands of ribbon on which were sewed cowries, pieces of money, coral, turquoise or

Mongols of the Koko-nor and the Ts'aidam were not wanting. They have adopted to a great extent the dress of their Tibetan neighbors: like the ass in the lion's skin, they doubtless think themselves more formidable when thus arrayed. Their women, when not married, dress their hair in Tibetan fashion, but the married ones wear two heavy tresses, falling on each side of the face and incased in black embroidered satin. K'alk'a Mongols from Eastern Mongolia were there also, the richness of their dress and the softer tones of their speech distinguishing them from their poorer and harsher-spoken kinsmen of the West.

Beside me stood some tall, swarthy-looking

¹ Not to be confounded with the Dragon boat festival, celebrated on the fifth of the fifth moon. The Dragon festival or procession here referred to is a part of the New Year festivities.

men with thin features and aquiline noses, dressed in dark violet gowns, and, unlike the Koko-nor Tibetan, with long queues and turquoise ear-rings in the left ear. They were traders from Lh'asa and Trashil'unpo, and had come from Tankar, where they had left their camels and goods, to see the festival.

But it would require a whole chapter to describe the various tribes represented at Lushar that day. One whose wild, fierce looks, and whose long swords, on which their hand always rested, fixed my attention from the first. They were K'ambas, or Hung-mao-tzu,—"Red-capped men," as the Chinese of Kan-su call this people,—natives of Eastern Tibet. Their dress is a dirty sheepskin gown hanging in large folds below their waists and hardly reaching to their knees; their boots, with rawhide soles and tops of bright-colored cloth, are held by garters below the knee. They wear no head-dress. Their long, tangled hair, falling over their shoulders and cut in a fringe to their eyes, is so matted and thick that they do not feel the want of a better head-cover. The Chinese and Mongols fear them, and venture but rarely and with trembling into the wilds which they inhabit south of the source of the Yellow River and along the upper course of the Yang-tze-kiang, or Dré'ch'u, as it is called in their language.

Though the street scenes at Lushar were full of varied interest, I was impatient to see Kumbum and its temples; so we crossed over to the other side of the valley, and, pushing our way through the crowd of peddlers and people of every description who thronged the hill-side, passed under a high white monument—offering holder or receptacle—and entered the lamasery grounds. A broad road, now crowded with people buying and selling every variety of goods, led to a building with red walls and green-tiled roof, the convent treasure-house. Near it was another smaller building with a garden in front inclosed within high walls. It was the temple of the famous tree which grows on the spot where the hair of Tsongk'apa had fallen when he was shaved and consecrated to the church by his mother. On each of its leaves is an outline figure of the god. The lamas say that this tree is a white sandal-wood, but it is probably a lilac. This appeared to me the more likely, as I was told that it bears large bunches of violet flowers in the spring. The leaves which fall from the tree are carefully gathered up and sold to visitors, who keep them as charms or use them as medicine. Those I got were so broken that I could distinguish nothing on them; but I was assured by unbelieving Mohammedans that the picture is clearly discernible on the leaves, and that they are "valuable curios," as they put it.

On this my first visit to the lamasery I could not visit the treasure-house, which was only opened on the 15th, when the Chinese ambassador, or Hsi-ning Amban, as he is commonly called, visited the place; but we were shown the chief temple, whose golden roofs had attracted my attention when I was approaching Lushar. It is in its main features built in Chinese style, and does not differ essentially from the Buddhist temples seen at Peking and

HOLY WATER VASE.

in other localities in Northern China. In front is a spacious courtyard, and the temple is raised some eight feet above its level. Those who wish to worship before the holy shrines stand on a broad plank walk in the courtyard at the base of the temple and there they make their prostrations. The deep grooves worn in the planks by the feet and hands of the devotees testify to the popularity of this gymnastic form of worship. In the dimly lighted temple we could distinguish only the three principal shrines, the central one that of Gautama

Buddha, that on his right Tsongk'apa, and that on his left Dipankara Buddha.

To the right of this gold-roofed temple is the temple of Tsongk'apa called the *Jé k'ang*. It has two superposed roofs, covered with green tiles and supported by red-lacquered pillars. The lower wall of the building is covered with green tiles and a narrow walk leads around it. In front of the temple, within a little wooden paling, is another "white sandal-wood tree," on the branches of which hang numbers of ceremonial scarfs offered by the faithful. My Chinese servant, who accompanied me in my walk, nearly got into trouble here. We had entered the temple inclosure on its left side, and started to walk around, keeping it on our right hand. He, not knowing or forgetting that to walk around a sacred building keeping it on one's left side is sacrilegious, began his walk in the wrong direction. He had not gone two steps when he was pulled up by a lot of lamas and visitors and started off in the right way, with some forcible remarks about his improper conduct in holy places.

Tsongk'apa, to whom Kumbum owes its origin, deserves more than a passing mention, for he is the founder of the form of Buddhist worship which prevails throughout Mongolia and the greater part of Tibet—in short, of modern lamaism. He was born A. D. 1360, near the place where Kumbum now stands, his parents belonging to the Amdo Tibetans, who still inhabit the country. At the age of sixteen he began his theological studies, but the following year, by the advice of his teacher, he went to Lh'asa, where he soon became a master in all the branches of Buddhist learning. Abbé Huc, struck by the many points of resemblance between the lamaist and Catholic churches, was convinced, when he heard that the first teacher of Tsongk'apa had a long nose, that he was one of the Catholic missionaries who at that time had penetrated Central Asia in large numbers.¹ The length of a nose is but a poor foundation for such an important theory, and, even if we accept noses as criterions, we would find that those of the people of Turkestan are quite as long, if not longer, than our own. We have, however, the authority of Marco Polo for it that in his time (latter part of the thirteenth century) there were some Christians at Hsi-ning (Sinju), and we know that in the fourteenth century Christianity flourished at Peking. But this is no proof that Tsongk'apa, who when only seventeen went to Lh'asa, where Christianity certainly was not to be found, had ever seen a Catholic church or heard the Gregorian chant, and the whole subject requires much

more study before we can draw any conclusion, and above all it requires unprejudiced students who have no preconceived theories to demonstrate.

Huc gives a long list of points of resemblance in the dress, habits, and ceremonies of the lamas and Catholic priests, comprising the use of the crozier, miter, dalmatic, censor held by five chains, holy water, chanting, exorcisms, worship of saints, celibacy, retreats, fasts, and litanies; but he omits one which I think very curious. When a person is dying a lama will frequently be called in, to administer to him the *dro măn*, or "going medicine." With some of his spittle he anoints the forehead, the palms of the hands, and the soles of the feet of the dying person, to the end that he may have a rapid transmigration. Where did this idea of extreme unction come from? And where did they get that of drinking holy water as a cure for bodily pains, a habit frequently met with among uneducated Catholics?

If we can say nothing definite on this interesting subject, we have ample information concerning the origin and history of the lamaist church founded by Tsongk'apa. He, as we have seen, went to Lh'asa at an early age; there he studied, preached, reformed, and finally transmigrated into the person of Gédun drupa, who founded the Trashil'unpo lamasery in 1446 and became the first of the series of incarnated gods known as Panch'en rinpoché, although native works say that the first pontiff bearing this title was born in 1567. Becoming afterwards incarnate in Gédun jyats'o, he returned to Lh'asa and was made head of the great Drébung lamasery of that place. His successor was So-nam jyats'o, "the Sea of Charity," and all the succeeding incarnations have had the word *jya-ts'o* (i. e., sea) as a portion of their style. This pontiff visited the Mongol conqueror Altan Khan, and he, imagining that *jya-ts'o* (in Mongol *talé*) was his name, addressed him as Talé lama, and the name has been used ever since by Chinese and Mongols to designate the head of the lamaist hierarchy; but the Tibetans speak of him as "The victorious ocean," or "The most excellent protector." He is held to be an incarnation of the Merciful God who watches over the world, Shenrézig with the thousand heads and thousand eyes. In China this god has become a goddess and is called Kuan-yin, and half of the representations one sees of her show her holding an infant in her arms, and looking for all the world like the conventional statue of the Virgin Mary. I once came across a Chinese book entitled "The Fifty Manifestations of Kuan-yin." One picture showed her likeness as she appeared to an old

¹ Huc, "Souvenirs d'un Voyage dans la Tartarie," etc., Tome II., p. 114.

man in Shan-hsi, another the form under which she had shown herself to a devout priest, and in one she had appeared to a poor laborer as Peter the Great of Russia, for there was the picture of the great emperor in breastplate and wig and with a marshal's baton in his hand. In what strange semblance will Kuan-yin make her next appearance? Will it be as Washington or as Gladstone, both of whose pictures I have seen in out-of-the-way places in China?

We were walking homeward from the temple when suddenly the crowd scattered to the

he was on his way with his lictors to put an end to the scandal. I followed in his wake and saw the peep-show—whose special attraction, I am sorry to say, were European (Belgian) obscene pictures—knocked down, Punch and Judy laid out mangled beside it, the owners whipped and put to flight, and the majesty of ecclesiastical law and morality duly vindicated.

On the morning of the fifteenth of the first moon (February 14) I went, in company with a lama friend, to see the treasure-house and the

BLACK LAMAS AT THE KUMBUM FAIR.

right and left, the lamas running for places of hiding with cries of "*Gékor lama, gékor lama!*" and we saw striding towards us six or eight lamas with a black stripe painted across their foreheads and another around their right arms,— "black lamas," the people call them,— and armed with heavy whips, with which they belabored any one who came within their reach. Behind them walked a stately lama in robes of finest cloth and with head clean shaved. He was a "*gékor*," a lama censor or provost, whose duty it was to see that the rules of the lamasery were strictly obeyed, and who, in conjunction with two colleagues, like him appointed by the abbot for a term of three years, tries all lamas for whatever crimes or breach of the rules they may have committed. This one had heard that there were peep-shows, Punch and Judy shows, roulette tables, and other prohibited amusements on the fair-grounds, and

other sights which I had been prevented from seeing on my first visit. On the panels of the gates opening into the yard of the building were painted human skins, the hands, feet, and head hanging to them and all reeking with blood—these to frighten all evil-doers, most likely, and make their flesh creep at the very thought of what might befall them if they tried to rob the place. Then on the walls of the yard, and protected by a broad roof, were painted numbers of the guardian angels in their hideous trappings of snakes, human skins, skulls, and bones, wallowing in blood and surrounded by flames, and escorted by imps more ghastly than they with heads of bulls, hogs, dogs, or eagles. The building was small and very dark, so only with great difficulty could we distinguish the curious things with which it was filled. Bowls of silver, ewers of gold, images of the gods in gold, silver, and bronze, pictures, beautifully

BUTTER BAS-RELIEFS AT KUMBUM.

illuminated manuscripts, carpets, satin hangings, cloisonné vases, and incense burners enough to fill a museum. One big silver bowl was pointed out to me with a bullet hole through it, made during the late Mohammedan rebellion, when the lamasery was attacked, and the lamas with gun and sword defended their temples and treasures, and were killed by hundreds on the steps of the sanctuary or beside their burning houses. The Mohammedans spared the temples and the sacred sandal-wood trees, not even taking the gold tiles from the chief temple; a most extraordinary piece of sentimentalism on their part, or rather a miraculous intervention of the gods to preserve their holy place.

A little later on the Hsi-ning Amban and the high Chinese authorities of this part of the province arrived to see the butter bas-reliefs to be exposed that evening. The lamas, squatting on the ground, lined the road for more than half a mile, and through the midst of them the Amban and his suite passed, his well-mounted escort carrying bright-colored pennants on the ends of their lances, with trumpet blasts echoed back by the deep-sounding convent conch-shells.

When it had grown dark we once more went to Kumbum. Outside the southern wall of the gold-roof temple were two large butter bas-reliefs, under a high scaffolding from which hung innumerable banners painted with pictures of gods and saints, while here and there were gaudy Chinese lanterns with pictured sides. The bas-reliefs were about thirty feet long and ten feet high, supported by a framework and lighted up by rows of little brass bowls filled with butter in which burned cotton wicks. The subjects were religious, representing gods in the usual lamaist style, with scenes in the various heavenly abodes or in the different hells. The central figure of each group was about four feet high, and in the background around it were long processions, battles, etc., each figure — and there were hundreds — not over eight or ten inches high. Every detail was most carefully worked out in this large slab of butter, and painted in the florid but painstaking style of lamaist illumination. Around each tableau had been worked an elaborate framework of flowers, birds, and Buddhist emblems, from among which a squirrel was peeping out or a dragon twisting its scaly body. Along the

A GUILT-OFFERING AT TANKAR.

walk which led around the temple were seven smaller bas-reliefs about ten feet long and five feet high, each representing scenes similar to those in the larger ones and all worthy of the greatest praise, not only on account of the labor bestowed on them, but for their artistic merit. It takes about three months' labor to finish one of these bas-reliefs, for which the only reward awaiting the makers is the praise of their fellow-lamas and a small sum of money given as a prize to the best piece of work. Every year there are new designs and new artists who bring their experience and skill to add to the beauty of the feast; for it is held in all lama-

series, though in none, not even in those of Lh'asa, is it so beautiful as at Kumbum. The lamas who are experts at modeling butter bas-reliefs travel about from lamasery to lamasery, the fame of their skill frequently preceding them, and they are sure of a hearty welcome, food, and lodging wherever they choose to stay.

It is possible, even probable, that this lamaist feast owes its origin to the Chinese, whose feast of lanterns, which has been celebrated since A. D. 700 at least, falls on the same day.

The next morning the bas-reliefs had dis-

appeared, the lamasery had assumed its habitual quiet, and the people were returning to their homes in the mountains or on the steppe, the girls and women probably comparing notes on the feast and showing one another the presents they had received from their admirers; among them red silk scarfs, which they hang about their persons, hold a prominent place and are recognized "favors" among them. Though I had come to Kumbum to see the feast, I had also hoped to be able to organize with rapidity a little caravan of my own, or to join some large one and strike out towards Tibet. But I soon found out that this was not such an easy matter. I had come thus far with only one servant and a pony, and now I must have five or six more horses, four or five camels, and two or three men speaking Mongol and Tibetan. The horses were easy enough to buy, and I soon had four good strong ones hobbled in the courtyard of the inn; but camels were nowhere to be found, and men willing to risk themselves in the wilds of the Koko-nor and Tibet were undiscoverable. For six weeks I searched the country, assisted by several old friends whom I had known at Peking, chief among whom was the steward of the beautiful Kuo-mang ssu, or *Serkok* lamasery, north of Hsi-ning some thirty miles. I went to see him and to visit the lamasery, and he engaged first one lama, then another, to go with me, but each one abandoned me after a few days. Then a Mongol lama, called Tsairang-lama, who had been

with the Russian traveler Potanin for two years, came to me; but when he heard that I purposed traveling with only four or five men, with no escort or passport, he refused to have anything to do with me, especially as he saw there would not be much money to be made on such a journey. Then I endeavored to secure Chinese, and finally, after trying some half-dozen, I got three Mohammedans from near Tankar. More honest and better men never breathed; and had it not been for the rascal I had brought with me from Peking,—spoilt by having served and squeezed too many foreigners,—I should have been perfectly satisfied with my party.

Camels are not numerous in this part of China, nor are they in the Koko-nor and the Ts'aidam, and good ones were sold for tremendous prices—much too high for my slender purse. Finally I secured five of the vile brutes, and all my other supplies were gradually, but with great trouble, got together, so that towards the middle of March I was ready to leave China. Saying farewell to Lussar, I went to Tankar, a large frontier trading post some twenty odd miles to the west of Hsi-ning, which commands the route to the Koko-nor, the Ts'aidam, and Tibet, occupying the same position for the trade on the north-western border of China as Ta-chien-lu in Ssu-ch'uan does for the western and Li-kiang Fu for the southwestern.

Here I met Tibetans from all parts of their country, and men from Kashgar and Khoten, called "turbaned people," or black barbarians, selling Khoten prayer rugs, Hami raisins, and dried melons. Indian rupees, Russian rubles, Kashgar *tengas*, and Lh'asa *trankas* were in every money-changer's, Chinese cash was no longer in favor, and in every shop hung queer-looking goods, unknown to the Chinese or of entirely different shape when used by them.

Tankar was one of the strongholds of the Mohammedans when the rebellion broke out

some thirty years ago, and it was one of the towns which suffered most from that war. The imperial troops after its capture put to death over three thousand Mohammedan families, since which time no Mohammedan has been allowed to take up his residence within its walls unless one of the inhabitants stands his security. Then these years of warfare drove the greater part of the Tibetan trade, which used to come here, to Ta-chien-lu; and so Tankar,

mind a man ought not to undertake a journey in Central Asia unless he is in robust health; and if he is, he will surely be able to live on the same food which answers for the natives. Moreover, I believe that a traveler should share with his men his food and comforts, and not live like a sybarite on corned beef, baked beans, and such preserved delicacies when they have only tea, a little meal, and rancid butter. It is not very pleasant to follow these rules, but

INTERIOR OF A TIBETAN TENT.

although it is now looking up again, is no longer the great trading post it used to be.

Here we bought the provisions and camping outfit requisite for the journey westward—brick tea, parched barley meal (*tsamba*), vermicelli, and rice for ourselves, and barley for the horses and camels. Two small blue cotton tents and a few sheets of felt, a water cask, a copper kettle, a ladle, and a bellows completed our not too cumbersome outfit, which, with the things I had brought with me from Peking, did not weigh all told over 500 pounds. Each man had a pair of big saddle-bags in which he carried his personal belongings and a few extra articles of food. His saddle-cloth became his bed at night, his saddle his pillow, and the clothes on his back his bedclothes. The only article¹ of foreign food I took with me was a five-pound can of Chollet's compressed vegetables, and I carried it back to Shanghai without ever opening it. To my

if one does he can ask and obtain more from his followers than he could otherwise, and where he goes they very probably will follow him; at least they will when privations are the only thing they have to fear.

While at Luser and at Tankar I met a number of men and women belonging to a curious tribe of Mohammedans living to the south of the Yellow River near Ho-chou, called Salar.¹ They are of Turki stock, having come from Turkestan some centuries ago, but though not forming a large tribe, and living in the midst of the Chinese, they have retained their language and to a great extent the peculiar features distinctive of their race, especially the thin aquiline nose. The traders who visit Tankar and the adjacent country from Kashgar and other parts of Turkestan have no difficulty in making themselves understood by

¹ They are also called "Black-capped Mohammedans" by the Chinese.

the Salar. They are also much more devout Mohammedans than their Chinese co-religionists, and greater fanatics, and Ho-chou, the principal city in their part of the province, where they are very numerous, is still a hotbed of rebellion where revolts against Chinese authority are of yearly occurrence. Near Tankar is another Mohammedan tribe, also possibly of Turki descent, but about which I could not obtain satisfactory information, as they are now confounded with the Mongols. They are the Tolmok or Tolmok-gun, of whom there are perhaps one thousand, and future travelers in this country should make inquiries concerning them. Chinese authors give the names of thirty-four different aboriginal or foreign tribes inhabiting the Kansu border-land, but the little they tell us of them is only sufficient to excite our curiosity without satisfying it on any point. Huc speaks of the Dschiahours as of a tribe living south-east of Hsi-ning; but this name, which should be written Jya-hor, is a generic one for all Tibetans living along the border, and is not the name of any special tribe. Prjevalsky's Dady or Doldy will, in all probability, turn out on further examination to be either an inaccurately transcribed expression or a Chinese nickname for some of the Mongols living to the north and northwest of Hsi-ning under the rule of Mori wang.¹ From this we may learn that the ethnography of this part of China is practically unknown, or, from having been inquired into by persons unacquainted with the language spoken there, is misunderstood and misrepresented.

While at Tankar I witnessed a religious ceremony of an interesting nature performed for the benefit of the Tibetan traders from Trashil'unpo stopping there, and known as a Ku-rim (*i. e.*, removal of bodily disease). A small pyramid made of *tsamba* and butter was placed on an ornamented wooden framework

in a room, and, after a church service, all those for whose benefit the ceremony was performed passed under it, by so doing diverting from their heads any impending disease, misfortune, or other evil. Then the lamas carrying the guilt-offering, followed by all the traders, dressed in their finest apparel and bearing guns and swords, issued out of the gate of the town and went to a place where a great pile of straw and brushwood had been made ready. The chief lama, after reading a few charms, exorcisms, and mystic sentences, had fire applied to the pile, and as the flames leaped up the offering was flung into them, while the assistants fired off their guns and the lamas chanted prayers and blew horns. When the fire had consumed the offering, and all the impending ill-luck, the procession formed again, and the laymen, in single file on each side of the monks, escorted them home with drawn swords, singing the while in deep bass voices supposed to be terrifying.

On the 25th of March we left Tankar and rode up the valley of the Hsi-ning River to its head. Passing the last Chinese village when ten miles from Tankar, we were suddenly in the midst of a country inhabited only by nomadic Tibetans and Mongols. The former live in black tents, which Huc likens most

¹ The Chinese call the Mongols Ta-tzu, hardly ever Meng-ku. Ta-tzu is an abbreviation of Ta-ta-tzu or Ta-ta-ehr, whence our Tatar. The word in Chinese has no meaning, and is of foreign origin.

COPPER AND SILVER PRAYER WHEELS.

felicitously to huge black spiders with long, thin legs, their bodies resting on the ground; for, unlike any other tents I have seen, the Tibetan tent has only two poles, supporting a ridgepole in the interior, while the corners and sides of the tent are held by ropes on the outside, which pass over high poles and are fastened to the ground some distance from the tent. The top of the tent is open along the greater part of its length, and under this opening stands the furnace or range on which the cooking is done. It is made of stones and mud with a fireplace at one end, and is so arranged that the heat passes along its whole length and four or five kettles can be kept boiling at once. This furnace is practically the only article of furniture seen in a Tibetan tent, if furniture it can be called, since it is left standing when the owner moves to another place. Besides this, one sees in their tents only a quantity of leather bags in which their tea and meal are kept, pack-saddles, sheets of felt, and nondescript rags and odds and ends of which only the owner knows the use and value. In the spring a large portion of the tent is occupied by young lambs and kids hobbled by one leg to a rope stretched near the wall. The tents of the Mongols are of felt, and far superior to those of the Tibetans. A light wooden framework only six feet high, so made that it folds up into a convenient shape for packing, is placed so as to form a circle about twelve feet in diameter; then the roof, made of sticks arranged like the ribs of an umbrella, is placed on top of the framework, sheets of felt are tied over it and the sides, and a small two-paneled wooden door is fixed on the south side.¹ With this the tent is complete. In the middle, under

the large hole in the roof, a small iron grate is placed in which dried yak manure is used as fuel, the fire kept burning by a bellows made of goatskin, in one end of which an iron tube is inserted.

Mongols and Tibetans around the Koko-nor live alike, both equally wretched. Some tea leaves — or tea twigs rather — are pounded in a small stone mortar and then thrown into a kettle, and after boiling for a few minutes the pot is placed in the midst of the guests squatting around it on the ground. Each one draws from the bosom of his gown a little wooden bowl, also used on occasions as washbowl, and fills it with tea. Taking a chunk of butter, except in summer fearfully rancid, he lets it melt in his bowl and then adds a handful of tsamba from the bag set before him. Then he works tea, butter, and tsamba into a ball of brown dough which he eats, drinking as much tea as is necessary to wash down the sodden lumps. Such is the daily food of these people, only varied now and then by the addition of a little boiled mutton, sour milk, cheese, or *choma*, which is a small, sweet tubercle that grows in great profusion in the damper parts of Eastern Tibet and Kan-su and tastes something like a sweet potato.²

In dress and habits the Tibetans living outside the Chinese border and in the vicinity of the Koko-nor are hardly distinguishable from those inhabiting the mountains of the Hsi-ning circuit, only their tribal organization differing. These Tibetans living within the borders are called Amdowa, those outside of it Panak'a, and all of them are known to the Chinese as Fan-tzu, or "Barbarians." The Amdowa have a larger number of petty chieftains, but, as far as I could learn, no prince or chief ruler; but the Panak'a have two, the more influential — or rather the better known — of whom is the Konsa lama, who lives to the north of the Koko-nor. The present incumbent of this office, one he-

¹ The Mongols are particular to have their tents facing south; not so the Tibetans, whose only care is that they do not face in the direction of the prevailing winds.

² Botanists call it *Potentilla anserina*.

reditary in his family, is called Arabtan, and he is said to be the richest man among all his people. His fortune consists of 2000 sheep, 300 camels, and 300 ponies, worth altogether about \$12,000. When this chief's father had grown old the son killed him and took his place. To kill one's aged parents is a common practice among these Panak'a, and even among the Mongols; if the latter do not deliberately kill them, they hasten their death by all kinds of bad treatment.

When among these Tibetans a person is dying, a relative or friend will approach him and inquire if he purposes coming back again after death. If he says he does, he is smothered; but if he answers that he will not, he is permitted to die in peace. The exact meaning of this custom is not clear, but it may probably be found in the dread of the spirits of the dead haunting their former abodes. Dead bodies

no one ever dreams of cleaning the kettle afterwards, and every one has to mix his own tsamba and lick his bowl clean when he has finished. Every four or five years she may have to sew a new sheepskin gown for herself or for some one of her family, but certainly not oftener. She cannot herd the cattle or sheep; men must do that, as there is danger from marauders. She passes her time spinning yarn, weaving a coarse kind of cloth out of which bags are made, turning a prayer wheel, and—destroying too voracious vermin. Her toilet requires rearranging only four or five times a year—when she visits Kumbum or some other fair; she never washes herself or her garments, and her children cannot outgrow their clothes: they have only to let out a little the folds of the gown, their unique garment, tucked up around the waist, and it will fit them until they are grown up.

1. WOOLEN SOCKS. 2. HEMP SANDALS. 3. LEATHER MOCCASIN. 4. LEATHER BOOT.

are not buried but are exposed on the hillsides, where birds of prey devour them. If the body is rapidly devoured, it is held to be a proof of the righteousness of the deceased; but if the birds of the air, the wolves, and the foxes refuse to eat it, it is evidence of his wickedness. The bodies of lamas are burned, and the ashes deposited beneath a monument, or else they are disposed of as are those of laymen.

Among the Tibetans a man marries only one wife, whom he purchases from her parents, a belle often costing as much as ten ponies and thirty yaks. The price to be paid for the wife is arranged by a relative or a friend who acts as go-between, and the only marriage ceremony is a grand spree lasting as long as the bridegroom can afford to keep it up. The life of a Tibetan woman in this part of the country cannot be deemed a hard one. She makes the tea, it is true, but with that the housekeeping ends; for

The men are not much more occupied than the women; they herd their horses, yaks, and sheep without fatigue, and while smoking their pipes and gossiping with friends. They shear their sheep and twist the wool into loose ropes, in which shape they carry it to Tankar to sell to the Chinese, and this is the hardest work of the year. The price of the wool, to which should be added that from the sale of lamb-skins, yak hides, and a few furs, principally lynx and fox, suffices to purchase all the tea, tsamba, and vermicelli they require; and the few iron or copper implements they make use of are made for them by itinerant Chinese blacksmiths who visit them now and then. Just before leaving Tankar some one had suggested to me the advisability of taking a large stock of leather boots such as Mongols and Tibetans wear; so I bought 20 or 30 pairs for about \$10, and I found them of the greatest

use, for boots are a regular unit of value in the Koko-nor and Ts'aidam. A sheep is valued at a pair of boots, so is a yak's hide, four wild asses' skins, or eight pecks of barley. When boots were not in demand we were able to purchase whatever we might require with buttons, turquoise beads, needles, or tea. This last

STEEL AND TINDER BOX, MOUNTINGS IN SILVER.

article is sold at Tankar in bricks about 16 inches long 8 broad and $1\frac{1}{2}$ thick, weighing 6 pounds and costing \$1.85. Forty miles west of Tankar it is worth \$2.50, and in the Ts'aidam it has a fixed value of \$5, a brick. Money throughout the Koko-nor and Ts'aidam is but rarely used, all purchases being made by barter, and I found a great deal of amusement in trading off worn-out tooth-brushes, empty bottles, old socks, etc., to the best advantage for barley and butter, milk or cheese.

On the third day after leaving Tankar we reached the head of the Hsi-ning ho valley, and some miles away on our left we saw a glistening sheet of ice stretching as far westward as the eye could reach, while to the south of it rose a high snow-capped range of rugged mountains. It was the Koko-nor, the "Blue lake," the Ch'ing hai of the Chinese, with a circumference of some 250 miles and an altitude of about 10,900 feet above sea level. To the northeastern side of the lake the country stretched out in an undulating steppe, bordered by another range of mountains gradually receding from it as it trended westward till they were lost to sight in the haze which bounded the horizon. Here and there over the broad expanse were scattered the black tents of Panak'a, while large herds of antelopes and wild asses could be seen feeding in the more secluded hollows or scampering away in single file across the open. The soil was sandy, the grass thin and stiff, and water scarce, the streams which flow down from the distant range into the lake being many miles apart. No snow was anywhere to be seen save on the tops of the range to the south of the lake, and

had it not been for the strong northwest wind, — the Chinese call it "black wind," — which blew almost continually, it would have been pleasantly warm; even as it was, the thermometer marked 58° F. at noon at our first camp near the lake.

During all my journey through the Koko-nor steppe, the Ts'aidam, and Tibet the daily routine of our life was the same. At daylight we arose, and while two men fed the pack animals and saddle horses another lighted a fire of dry yak manure and made a kettleful of tea, which we drank with a few lumps of tsamba. Then the loads being put on the pack animals, camels, yaks, or ponies, we started and marched for five or six hours, when we halted to drink tea and to let the animals feed on what they could pick up, grass or brush. Three or four hours more of marching found us at a camping-ground, and in a little while the tents were pitched, the horses sidelined and hobbled and turned out to graze till night. Before dark we took our evening meal, consisting of vermicelli, boiled mutton, tea, and tsamba. Then the horses were driven in and tied by one foot to a long hair rope fastened to the ground in front of the tent, our two big Tibetan mastiffs let loose, and as night fell we all settled ourselves in our tents, I to work out my day's survey, write up my notes and take some observations, the men to fix their saddles and get ready for the next day's march, and all of us finally to sleep. Thanks to our dogs, we were never obliged to stand watch, for not a living creature could get within a quarter of a mile of our camp without the deep, angry barks of Largé and J'yamar giving us ample warning. These dogs had, in common with all their breed, a curious way of watching; they did not lie near the tents, but went each in an opposite direction some two or three hundred yards off and there lay down, and woe to any stranger who came near them. Several Mongols will carry all their lives the marks of the teeth of old J'yamar. A few balls of tsamba and some bones once a day was all the feeding they got while I owned them, and I suppose these short rations helped to ruin tempers not naturally sweet.

The Mongols who live near the northeastern side of Lake Koko-nor are not numerous or well to do; they are in constant dread of their predatory and bullying neighbors the Panak'a, and do not venture very far beyond the Chinese frontier. The greater part of them occupy the basin of the Ta-t'ung ho to the northwest of Hsi-ning, and they are governed by a prince known as Mori-wang,¹ who divides with the prince of Koko-nor (*Ch'ing-hai wang*), living to the southwest of the lake in the Ts'aidam ba-

¹ Prjevalsky calls him Murwang.

sin, the government of all the Mongol tribes in the vicinity of the Koko-nor. Every year these princes are bound to repair to Tankar to visit the emperor's legate, the Amban, who confers on them gifts in the name of his master, and then they renew their oaths of fealty by doing obeisance before an imperial throne. Every three years they are obliged to travel to the capital to bear tribute to the emperor, assist at a banquet, and receive some paltry presents — satin, embroideries, pouches, etc.

The Panak'a or Koko-nor Tibetans are not held to the accomplishment of any of these duties, and are practically independent, only paying the Chinese government a small poll tax. Those living to the south of the lake refuse even to do that, nor will they supply to Chinese officials traveling in their country horses, beasts of burden, and food without being duly paid for them, although these supplies, known as *ula*, are held to be compulsory on all tributary tribes without the border.

SILVER COINS OF CHINESE TURKESTAN.

MIDWINTER STORM IN THE LAKE REGION.

RISES the wild, red dawn over the icicled edges
Of black, wet, cavernous rocks, sheeted and winter-scarred,
And heaving of gray-green waves, foaming the ice-blocks and ledges,
Into this region of death, sky-bounded, solitude-barred.

Turned to the cold kiss of dawn, gilding their weird dark faces,
Lift the cyclopean rocks, silent, motionless, bare;
Where high on each haggard front, in deep-plowed, passionate traces
The storm hath graven his madness, the night hath furrowed her care.

Out of the far, gray skies comes the dread north with his blowing
That chills the warm blood in the veins, and cuts to the heart like fate.
Quick as the fall of a leaf the lake-world is white with his snowing,
Quick as the flash of a blade the waters are black with his hate.

God pity the sad-fated vessels that over these waters are driven
To meet the rude shock of his strength and shudder at blast of his breath.
God pity the tempest-drave sailors, for here naught on wave or in heaven
Is heard but the hate of the night, the merciless grinding of death.

William Wilfred Campbell.

Christmas.

WHY does the earth no tribute flower,
No incense-bearing blossom, bring
To celebrate the thrice-blessed hour
Which brought to her heaven's earth-
born King?

This birthday of eternity
Finds fitter wreath in deathless pine
The laurel and the hemlock tree,
Bound with the ivy's coiling vine.

Why do no roses wreath her head?
Why do no lilies gleaming white,
With every rainbow blossom wed,
Weave odorous emblems of delight?

That Prince of Heaven, that God earth-born,
'T was not for mortal joy he came,
The holly with its cruel thorn
Suits well the day that bears his name;

Those short-lived buds she dare not bring,
For though they fit her fleeting years,
They are not meet to deck the spring,
The dawning summer of the spheres.

And the white wrappings of the snow
Like swathings in the manger's gloom;
And drifts beneath the thick boughs glow
Like grave-clothes in the empty tomb.

Henry Morton.

SISTER DOLOROSA.

BY JAMES LANE ALLEN,

Author of "The White Cowl," "Two Gentlemen of Kentucky," etc.

WHEN Sister Dolorosa had reached the summit of a low hill on her way to the convent, she turned and stood for a while looking backward. The landscape stretched away in a rude, unlovely expanse of gray fields, shaded in places by brown stubble, and in others lightened by pale, thin corn—the stunted reward of necessitous husbandry. This way and that ran wavering lines of low fences, some worm-eaten, others rotting beneath over-clambering wild rose and blackberry. About the horizon masses of dense and rugged woods burned with somber fires as the westering sun smote them from top to underbrush. Forth from the edge of one a few long-horned cattle, with lowered heads, wound meekly homeward to the scant milking. The path they followed led towards the middle background of the picture, where the weather-stained and sagging roof of a farm-house was just visible above the tops of aged cedars. Some of the branches, broken by the sleet and snow of winters, trailed their burdens from the thinned and desolated crests—as sometimes the highest hopes of the mind, after being beaten down by the tempests of the world, droop around it as memories of once transcendent aspirations.

Where she stood in the dead autumn fields few sounds broke in upon the pervasive hush of the declining day. Only a cricket, under the warm clod near by, shrilled sturdily with cheerful forethought of drowsy hearthstones; only a lamb, timid of separation from the fold, called anxiously in the valley beyond the crest of the opposite hill; only the summoning whistle of a quail came sweet and clear from the depths of a neighboring thicket. Through all the air floated that spirit of vast loneliness which at seasons seems to steal like a human mood over the breast of the great earth and leave her estranged from her transitory children. At such an hour the heart takes wing for home, if any home it have; or when, if homeless, it feels all the quick stir of that fond yearning for the evening fireside with its half-circle of trusted faces young and old—with its bonds of love and marriage, those deepest and most enchanting realities to the earthly imagination. The very landscape, barren and

dead, but framing the simple picture of a home, spoke to the beholder the everlasting poetry of the race.

But Sister Dolorosa, standing on the brow of the hill whence all the picture could be seen, yet saw nothing of it. Out of the western sky there streamed an indescribable splendor of many-hued light, and far into the depths of this celestial splendor her steadfast eyes were gazing.

She seemed caught up to some august height of holy meditation. Her motionless figure was so lightly poised that her feet, just visible beneath the hem of her heavy black dress, appeared all but rising from the dust of the pathway; her pure and gentle face was upturned, so that the dark veil fell away from her neck and shoulders; her lips were slightly parted; her breath came and went so imperceptibly that her hands did not appear to rise and fall as they clasped the cross to her bosom. Exquisite hands they were,—most exquisite,—gleaming as white as lilies against the raven blackness of her dress; and, by some startling fitness of posture, the longest finger of the right hand pointed like a marble index straight towards a richly embroidered symbol over her left breast—the mournful symbol of a crimson heart pierced by a crimson spear. Whether attracted by the lily-white hands or by the red symbol, a butterfly, which had been flitting hither and thither in search of the gay races of the summer gone, now began to hover nearer, and finally lighted unseen upon the glowing spot. Then, as if disappointed not to find it the bosom of some rose,—as if lacking all hope and strength for further quest,—there it rested, slowly fanning with its white wings the tortured emblem of the Divine despair.

Lower sank the sun, deeper and more widespread the splendor of the sky, more rapt and radiant the expression of her face. A painter of the angelic school, seeing her standing thus, might have named the scene the transfiguration of angelic womanhood. What but heavenly images should she be gazing on; or where was she in spirit but flown out of the earthly autumn fields and gone away to sainted vespers in the cloud-built realm of her own fantasies? Perhaps she was now entering yon vast cathedral of the skies, whose white spires touched blue eternity; or toiling devoutly up yon gray

mount of Calvary, with its blackened crucifix falling from the summit.

Standing thus towards the close of the day, Sister Dolorosa had not yet passed out of that ideal time which is the clear white dawn of life. She was still within the dim, half-awakened region of womanhood, whose changing mists are beautiful illusions, whose shadows about the horizon are the mysteries of poetic feeling, whose purpling east is the palette of the imagination, and whose upspringing skylark is blithe aspiration that has not yet felt the weight of the clod it soars within. Before her still was the full morning of reality — before her the burden of the midday hours.

But if the history of any human soul could be perfectly known, who would wish to describe this passage from the dawn of the ideal to the morning of the real — this transition from life as it is imagined through hopes and dreams to life as it is known through action and submission? It is then that within the country of the soul occur events too vast, melancholy, and irreversible to be compared to anything less than the downfall of splendid dynasties or the decay of an august religion. It is then that there leave us forever bright, aerial spirits of the fancy, separation from whom is like grief for the death of the beloved.

The moment of this transition had come in the life of Sister Dolorosa, and unconsciously she was taking her last look at the gorgeous western clouds from the hilltops of her chaste life of dreams. In a few minutes her feet were to cross the border-land of another world.

A flock of frightened doves sped hurtling low over her head, and put an end to her reverie. Pressing the rosary to her lips, she turned and walked on towards the convent, not far away. The little footpath across the fields was well trodden and familiar, running as it did between the convent and the farm-house behind her in which lived old Ezra and Martha Cross; and as she followed its windings, her thoughts, as is likely to be true of the thoughts of nuns, came home from the clouds to the humblest concerns of the earth, and she began to recall certain incidents of the visit from which she was returning.

The aged pair were well known to the Sisters. Their daughters had been educated at the convent; and, although these were married and scattered now, the tie then formed had since become more close through their age and loneliness. Of late word had come to the Mother Superior that old Martha was especially ailing, and Sister Dolorosa had several times been sent on visits of sympathy. For reasons better to be understood later on, these visits had had upon her the effect of an April shower on a thirsting rose. Her mission of

mercy to the aged couple over, for a while the white taper of ideal consecration to the Church burned in her bosom with a clearer, steadier luster, as though lighted afresh from the Light eternal. But to-day she could not escape the conviction that these visits were becoming a source of disquietude; for the old couple, forgetting the restrictions which her vows put upon her very thoughts, had spoken of things which it was trying for her to hear — love-making, marriage, and children. In vain had she tried to turn away from the proffered share in such parental confidences. The old mother had even produced and read aloud a letter from her eldest son, telling them of his approaching marriage and detailing all the hope and despair of his wooing. With burning cheeks and downcast eyes Sister Dolorosa had listened till the close and then risen and quickly left the house.

The recollection of this returned to her now as she pursued her way along the footpath which descended into the valley; and there came to her, she knew not whence or why, a piercing sense of her own separation from all but the Divine love. The cold beauty of un-fallen spirituality which had made her all but august as she stood on the hilltop died away, and her face assumed a tenderer, more appealing loveliness, as there crept over it, like a shadow over snow, that shy melancholy under which those women dwell who have renounced the great drama of the heart. She resolved to lay her trouble before the Mother Superior to-night, and ask that some other Sister be sent hereafter in her stead. And yet this resolution somehow gave her no peace, but a throb of painful renunciation; and since she was used to the most scrupulous examination of her conscience, to detect the least presence of evil, she grew so disturbed by this strange state of her heart that she quite forgot the windings of the pathway along the edge of a field of corn, and was painfully startled when a wounded bird, lying on the ground a few feet in front of her, flapped its wings in a struggle to rise. Love and sympathy were the strongest principles of her nature, and with a little outcry she bent over and took it up; but scarce had she done so, when, with a final struggle, it died in her hand. A single drop of blood oozed out and stood on its burnished breast.

She studied it — delicate throat, silken wings, wounded bosom — in the helpless way of a woman, unwilling to put it down and leave it, yet more unwilling to take it away. Many a time perhaps she had watched this very one flying to and fro among its fellows in the convent elms. Strange that any one should be hunting in these fields, and she looked quickly this way and that. Then, with a surprised movement of the hands that caused her to

drop the bird at her feet, Sister Dolorosa discovered, standing half hidden in the edge of the pale-yellow corn a few yards ahead, wearing a hunting-dress, and leaning on the muzzle of his gun, a young man who was steadfastly regarding her. For an instant they stood looking each into the other's face, taken so unprepared as to lose all sense of convention. Their meeting was as unforeseen as another far overhead, where two white clouds, long shepherded aimlessly and from opposite directions across the boundless pastures by the unreasoning winds, touched and melted into one. Then Sister Dolorosa, the first to regain self-possession, gathered her black veil closely about her face, and advancing with an easy, rapid step along the pathway, bowed low with downcast eyes as she passed him, and hurried on towards the convent.

She had not gone far before she resolved to say nothing about the gossip to which she had listened. Of late the Mother Superior had seemed worn with secret care and touched with solicitude regarding her. Would it be kind to make this greater by complaining like a weak child of a trivial annoyance? She took her conscience proudly to task for ever having been disturbed by anything so unworthy. And as for this meeting in the field, even to mention that would be to give it a certain significance, whereas it had none whatever. A stranger had merely crossed her path a moment and then gone his way. She would forget the occurrence herself as soon as she could recover from her physical agitation.

II.

THE Convent of the Stricken Heart is situated in that region of Kentucky which early became the great field of Catholic immigration. It was established in the first years of the present century, when mild Dominicans, starving Trappists, and fiery Jesuits hastened into the green wildernesses of the West with the hope of turning them into religious vineyards. It was then, accordingly, derived from such sources as the impassioned fervor of Italy, the cold, monotonous endurance of Flanders, and the dying sorrows of ecclesiastical France, that there sprang up this new flower of faith, unlike any that ever bloomed in pious Christendom. From the meagerest beginning, the order has slowly grown rich and powerful, so that it now has branches in many States, as far as the shores of the Pacific Ocean.

The convent is situated in a retired region of country, remote from any village or rural highway. The very peace of the blue skies seems to descend upon it. Around the walls great elms stand like tranquil sentinels, or at a

greater distance drop their shadows on the velvet verdure of the artificial lawns. Here, when the sun is hot, some white-veiled novice may be seen pacing soft-footed and slow, while she fixes her sad eyes upon pictures drawn from the literature of the dark ages, or fights the first battle with her young heart, which would beguile her to heaven by more jocund pathways. Drawn by the tranquillity of this retreat,—its trees and flowers and dews,—all singing birds of the region come here to build and brood. No other sounds than their pure cadences disturb the echoless air except the simple hymns around the altar, the vesper bell, the roll of the organ, the deep chords of the piano, or the thrum of the harp. It may happen indeed that some one of the Sisters, climbing to the observatory to scan the horizon of her secluded world, will catch the faint echoes of some young plowman in a distant field lustily singing of the honest passion in his heart, or hear the shouts of happy harvesters as they move across the yellow plains. The population scattered around the convent domain are largely of the Catholic faith, and from all directions the country is threaded by many footpaths that lead to the church as a common shrine. It was along one of these that Sister Dolorosa, as has been said, hastened homeward through the falling twilight.

When she reached the convent, instead of seeking the Mother Superior as heretofore with news from old Martha, she stole into the shadowy church and knelt for a long time in wordless prayer—wordless, because no petition that she could frame appeared inborn and quieting. An unaccountable remorse gnawed the heart out of all language. Her spirit seemed parched with aridity; her will was deadened as by a blow. Trained to the most rigorous introspection, she entered within herself and penetrated to the deepest recesses of her mind to ascertain the cause. The bright flame of her conscience thus employed was like the turning of a sunbeam into a darkened chamber to reveal the presence of a floating grain of dust. But nothing could be discovered. It was the undiscovered that rebuked her as it often rebukes us all—the undiscovered evil that has not yet linked itself to a conscious transgression. At last she rose with a sigh and dejectedly left the church.

Later, the Mother Superior, noiselessly entering her room, found her sitting at the open window, her hands crossed on the sill, her eyes turned outward into the darkness.

"Child, child," she said hurriedly, "how uneasy you have made me! Why are you so late returning?"

"I went to the church when I came back, Mother," replied Sister Dolorosa in a voice

singularly low and composed. "I must have returned nearly an hour ago."

"But even then it was late."

"Yes, Mother; I stopped on the way back to look at the sunset. The clouds looked like cathedrals. And then old Martha kept me. You know it is difficult to get away from old Martha."

The Mother Superior laughed slightly, as though her anxiety had been removed. She was a woman of commanding presence, with a face full of dignity and sweetness, but furrowed by lines of difficult resignation.

"Yes; I know," she answered. "Old Martha's tongue is like a terrestrial globe: the whole world is mapped out on it, and a little movement of it will show you a continent. How is her rheumatism?"

"She said it was no worse," replied Sister Dolorosa, absently.

The Mother Superior laughed again. "Then it must be better. Rheumatism is always either better or worse."

"Yes, Mother."

This time the tone caught the Mother Superior's ear.

"You seem tired. Was the walk too long?"

"I enjoyed the walk, Mother. I do not feel tired."

They had been sitting on opposite sides of the room. The Mother Superior now crossed, and, laying her hand softly on Sister Dolorosa's head, pressed it backward and looked fondly down into the upturned eyes.

"Something troubles you. What has happened?"

There is a tone that goes straight to the hearts of all women in trouble. If there are tears hidden, they gather in the eyes. If there is any confidence to give, it is given then.

A tremor, like that of a child with an unspent sob, passed across Sister Dolorosa's lips, but her eyes were tearless.

"Nothing has happened, Mother. I do not know why, but I feel disturbed and unhappy." This was the only confidence that she had to give.

The Mother Superior passed her hand slowly across the brow, white and smooth like satin. Then she sat down, and as Sister Dolorosa slipped to the floor beside her she drew the young head to her lap and folded her aged hands upon it. What passionate, barren loves haunt the hearts of women in convents! Between these two there existed a tenderness more touching than the natural love of mother and child.

"You must not expect to know at all times," she said with grave gentleness. "To be troubled without any visible cause is one of the mysteries of our nature. As you grow

older you will understand this better. We are forced to live in conscious possession of all faculties, all feelings, whether or not there are outward events to match them. Therefore you must expect to have anxiety within when your life is really at peace without; to have moments of despair when no failure threatens; to have your heart wrung with sympathy when no object of sorrow is nigh; to be permeated with the need of loving when there is no earthly thing to receive your love. This is part of woman's life, and of all women, especially those who, like you, must live not to stifle the tender and beautiful forces of nature, but to ennoble and unite them into one divine passion. Do not think, therefore, to escape these hours of heaviness and pain. No saint ever walked this earth without them. Perhaps the lesson to be gained is this: that we may feel all things before they happen, so that if they do happen we shall be disciplined to bear them."

The voice of the Mother Superior had become low and meditative; and, though resting on the bowed head, her eyes seemed fixed on events long past. After the silence of a few moments she continued in a brighter tone:

"But, my child, I know the reason of *your* unhappiness. I have warned you that excessive ardor would leave you overwrought and nervous; that you were being carried too far by your ideals. You live too much in your sympathies and your imagination. Patience, my little St. Theresa! No saint was ever made in a day, and it has taken all the centuries of the Church to produce its martyrs. Only think that your life is but begun; there will be time enough to accomplish everything. I have been watching, and I know. This is why I send *you* to old Martha. I want you to have the rest, the exercise, the air of the fields. Go again to-morrow, and take her the ointment. I found it while you were gone to-day. It has been in the Church for centuries, and you know this bottle came from blessed Loretto in Italy. It may do her some good. And, for the next few days, less reading and study."

"Mother!" Sister Dolorosa spoke as though she had not been listening. "What would become of me if I should ever—if any evil should ever befall me?"

The Mother Superior stretched her hands out over the head on her knees as some great, fierce, old, gray eagle, scarred and strong with all the storms of life, might make a movement to shield its imperiled young. The tone in which Sister Dolorosa had spoken startled her as the discovered edge of a precipice. It was so quiet, so abrupt, so terrifying with its suggestion of an abyss. For a moment she prayed silently and intensely.

"Heaven mercifully shield you from harm!" she then said in an awe-stricken whisper. "But, timid lamb, what harm can come to you?"

Sister Dolorosa suddenly rose and stood before the Mother Superior.

"I mean," she said, with her eyes on the floor and her voice scarcely audible—"I mean—if I should ever fail, would you cast me out?"

"My child!—Sister!—Sister Dolorosa!—Cast you out!"

The Mother Superior started up and folded her arms about the slight, dark figure, which all at once seemed to be standing aloof with infinite loneliness. For some time she sought to overcome this difficult, singular mood.

"And now, my daughter," she murmured at last, "go to sleep and forget these foolish fears. I am always near you!" There seemed to be a fortress of sacred protection and defiance in these words as she uttered them; but the next instant her head was bowed, her upward-pointing finger raised in the air, and in a tone of humble self-correction she added: "Nay, not I; the Sleepless guards you! Good-night."

Sister Dolorosa lifted her head from the strong shoulder and turned her eyes, now luminous, upon the calm but troubled face.

"Forgive me, Mother!" she said in a voice of self-disdain and scornful resolution. "Never—never again will I disturb you with such weakness as I have shown to-night. I *know* that no evil can befall me! Forgive me, Mother. Good-night."

While she sleeps learn her history. Pauline Cambron was descended from one of those sixty Catholic families of Maryland that formed a league in 1785 for the purpose of emigrating to Kentucky without the rending of social ties or separation from the rites of their ancestral faith. Since then the Kentucky branch of the Cambrons has always maintained friendly relations with the Maryland branch, which is now represented by one of the wealthy and cultivated families of Baltimore. On one side the descent is French; and, as far back as this can be traced, there runs a tradition that some of the most beautiful of its women became barefoot Carmelite nuns in the various monasteries of France or on some storm-swept island of the Mediterranean Sea.

The first of the Kentucky Cambrons settled in that part of the State in which nearly a hundred years later lived the last generation of them—the parents of Pauline. Of these she was the only child, so that upon her marriage depended the perpetuation of the Kentucky family. It gives to the Protestant mind a startling insight into the possibilities of a woman's life and destiny in Kentucky to learn

the nature of the literature by which her sensitive and imaginative character was from the first impressed. This literature covers a field wholly unknown to the ordinary student of Kentucky history. It is not to be found in well-known works, but in the letters, reminiscences, and lives of foreign priests, and in the kindling and heroic accounts of the establishment of Catholic missions. It abounds in such stories as those of a black friar fatally thrown from a wild horse in the pathless wilderness; of a gray friar torn to pieces by a sawmill; of a starving white friar stretched out to die under the green canopy of an oak; of priests swimming half-frozen rivers with the sacred vestments in their teeth; of priests hewing logs for a hut in which to celebrate the mass; of priests crossing and recrossing the Atlantic and traversing Italy and Belgium and France for money and pictures and books; of devoted women laying the foundation of powerful convents in half-ruined log cabins, shivering on beds of straw sprinkled on the ground, driven by poverty to search in the wild woods for dyes with which to give to their motley worldly apparel the hue of the cloister, and dying at last, to be laid away in pitiless burial without coffin or shroud.

Such incidents were to her the more impressive since happening in part in the region where lay the Cambron estate; and while very young she was herself repeatedly taken to visit the scenes of early religious tragedies. Often, too, around the fireside there was proud reference to the convent life of old France and to the saintly zeal of the Carmelites; and once she went with her parents to Baltimore and witnessed the taking of the veil by a cousin of hers—a scene that afterwards burned day and night before her conscience as a lamp before a shrine.

Is it strange if under such influences, living in a country place with few associates, eagerly reading in her father's library all books that were to be had on the legends of the monastic orders and the lives of the saints—is it strange if to the young Pauline Cambron this world before long seemed little else than the battlefield of the Church, the ideal man in it a monk, the ideal woman a nun, the human heart a solemn sacrifice to Heaven, and all human life a vast, sad pilgrimage to the shrine eternal?

Among the places which had always appealed to her imagination as one of the heroic sites of Kentucky history was the Convent of the Stricken Heart, not far away. Whenever she came hither she seemed to be treading on sacred ground. Happening to visit it one summer day before her education was completed, she asked to be sent hither for the years that remained. When these were past,

here, with the difficult consent of her parents, who saw thus perish the last hope of the perpetuation of the family, she took the white veil. Here at last she hid herself beneath the black. Her whole character at this stage of its unfolding may be understood from the name she assumed—Sister Dolorosa. With this name she wished not merely to extinguish her worldly personality, but to clothe herself with a lifelong expression of her sympathy with the sorrows of the world. By this act she believed that she was forming a direct personal alliance with all that was most exalted in the struggle of the human to make itself divine, and foresaw herself attaining the consummation of a change of nature so complete that the black veil of Sister Dolorosa would cover as in a funeral urn the ashes which had once been the heart of Pauline Cambron. And thus her conventual life began.

But for those beings to whom the span on the summer-evening cloud is as nothing compared with that fond arch of beauty which it is a necessity of their nature to hang as a bow of promise above every beloved hope—for such dreamers the sadness of life lies in the dissipation of mystery and the disillusion of truth. When she had been a member of the order long enough to see things as they were, Sister Dolorosa found herself living in a large, plain, comfortable brick convent, situated in a retired and homely region of southern Kentucky. Around her were plain nuns with all the invincible contrariety of feminine temperament. Before her were plain duties. Built up all around her were plain restrictions. She had rushed with outstretched arms towards poetic mysteries, and clasped prosaic reality. The heroic was nowhere in sight. Nor could she perceive that she had become a different being—become a saint.

As soon as the lambent flame of her spirit had burned over this new life, as a fire before a strong wind rushes across a plain, she one day surveyed it with that sense of reality which sometimes visits the imaginative with such appalling vividness. Was it upon this dreary waste that her soul was to play out its sublime drama of ideal womanhood?

She answered the question in the only way possible to such a nature as hers. She divided her life in twain. Half, with perfect loyalty, she gave out to duty; the other, with equal loyalty, she stifled within. But perhaps this is no uncommon lot—this unmating of the forces of the mind, as though one of two singing birds should be released to fly forth under the sky, while the other—the nobler singer—is kept voiceless in a darkened chamber.

But the Sisters of the Stricken Heart are not

cloistered nuns. Their chief vow is to go forth into the world to teach. Scarcely had Sister Dolorosa been intrusted with work of this kind, before, reaching eagerly outward for larger possibility, and influenced by tastes already formed, she conceived an aspiration to become a great teacher of history or literature, and obtained permission to spend extra hours in the convent library on a wider range of sacred reading. Here began a second era in her life. Books became the avenues along which she escaped from her present into an illimitable world. Her imagination, beginning to pine, now took wing and soared back to the remote, the splendid, the imperial, the august. Her sympathies, finding nothing around her to fix upon, were borne afar like winged seed and rooted on the colossal ruins of the centuries. Her passion for beauty fed on holy art. She lived at the full flood of life again. If in time *révolusion* came, if the silence of this dead world became unendurable, and its company of great and sainted souls but dust and stone, she would live a shy, exquisite, hidden life of poetry and the imagination, in which she herself played all the historic rôles. Now she would become a powerful abbess of old, ruling over a hundred nuns in an impregnable cloister. To the gates, stretched on a litter, wounded to death, they bore a young knight of the Cross. She had the gates opened. She went forth and bent over him; heard his dying message; at his request drew the plighted ring from his finger to send to another land. How beautiful he was! How many masses—how many, many masses—she celebrated for the peace of his soul! Now she was St. Agatha, tortured by the proconsul; now she lay faint and cold in an underground cell, and was visited by St. Thomas à Kempis, who read to her long passages from the “*Imitation*.” Or she would tire of the past, and making herself an actor in her own future, in a brief hour live out the fancied drama of all her crowded years.

But whatever part she took in this dream existence, this beautiful passion-play of the soul, nothing attracted her but the highest, the perfect. For the commonplace she felt only a guileless scorn.

Thus for some time these unmated lives went on—the fixed outward life of duty, and the ever-wandering inner life of love. In midwinter, walking across the shining fields, you have come to some little frost-locked stream. How mute and motionless! You set foot upon it, the ice is broken, and beneath is musical running water. Thus under the chaste and rigid numbness of convent existence the heart of Sister Dolorosa murmured unheard and hurried away unseen to plains made warm and green by her

imagination. But the old may survive upon memories; the young cannot thrive upon hope. Love, long reaching outward in vain, returns to the heart as self-pity. Sympathies, if not supported by close realities, fall in upon themselves like the walls of a ruined house. At last, therefore, even the hidden life of Sister Dolorosa grew weary of the distant, the future, and the past, and came home to the present.

The ardor of her studies and the rigor of her duties combined—but more than either that wearing away of the body by a restless mind—had begun to affect her health. Both were for the while relaxed, and she was required to spend as much time as possible in the walks and garden of the convent. It was like lifting a child that has become worn out with artificial playthings to an open window to see the flowers. With inexpressible relief she turned from medieval books to living nature; and her beautiful imagination, that last of all faculties to fail a human being in an unhappy lot, now began to bind nature to her with semblances of ties and fellowships which quieted the need of human association. She had long been used to feign correspondences with the fathers of the Church; she now established intimacies with various dumb companions, and poured out her heart to them in confidence.

The distant woods slowly clothing themselves in green; the faint perfume of the wild rose, running riot over some rotting fence; the majestic clouds about the sunset; the moon dying in the spectral skies; the silken rustling of doves' wings parting the soft foliage of the sentinel elms; landscapes of frost on her window-pane; crumbs in winter for the sparrows on the sill; violets under the leaves in the convent garden; myrtle on the graves of the nuns—such objects as these became the means by which her imprisoned life was released. On the sensuous beauty of the world, as she saw it around her, she spent the chaste ravishments, the mysterious ecstasies, of her virginal heart. Her love descended on all things as in the night the dew fills and bends down the cups of the flowers.

A few of these confidences—written on slips of paper, and no sooner written than cast aside—are given here. They are addressed severally to a white violet, an English sparrow, and a butterfly.

"I have taken the black veil, but thou wearest the white, and thou dwellest in dim cloisters of green leaves—in the domed and many-pillared little shrines that line the dusty roadside, or seem more fitly built in the depths of holy woodlands. How often have I drawn near with timid steps, and, opening the doors of thy tiny oratories, found thee bending at thy silent prayers—bending so low that thy lips

touched the earth, while the slow wind sang thine Angelus! Wast thou blooming anywhere near when He came into the wood of the thorn and the olive? Didst thou press thy cool face against his bruised feet? Had I been thou, I would have bloomed at the foot of the cross, and fed his failing lungs with my last breath. Time never destroys thee, little Sister, or stains thy whiteness; and thou wilt be bending at thy prayers among the green graves on the twilight hillside ages after I who lie below have finished mine. Pray for me then, pray for thine erring sister, thou pure-souled violet!"

"How cold thou art! Shall I take thee in and warm thee on my bosom? Ah, no! For I know who thou art! Not a bird, but a little, brown mendicant friar, begging barefoot in the snow. And thou livest in a cell under the convent eaves opposite my window. What ugly feet thou hast, little Father! And the thorns are on thy toes instead of about thy brow. That is a bad sign for a saint. I saw thee in a brawl the other day with a mendicant brother of thine order, and thou drovest him from roof to roof and from icy twig to twig, screaming and wrangling in a way to bring reproach upon the Church. Thou shouldst learn to defend a thesis more gently. Who is it that visits thy cell so often? A penitent to confess? And dost thou shrive her freely? I'd never confess to thee, thou cross little Father! Thou'dst have no mercy on me if I sinned, as sin I must since human I am. The good God is very good to thee that he keeps thee from sinning while he leaves me to do wrong. Ah, if it were but natural for me to be perfect! But that, little Father, is my idea of heaven. In heaven it will be natural for me to be perfect. I'll feed thee no longer than the winter lasts, for then thou'lt be a monk no longer, but a bird again. And canst thou tell me why? Because, when the winter is gone, thou'lt find a mate, and wert thou a monk thou'dst have none. For thou knowest perfectly well, little Father, that monks do not wed."

"No fitting emblem of my soul art thou, fragile Psyche, mute and perishable lover of the gorgeous earth. For my soul has no summer, and there is no earthly object of beauty that it may fly to and rest upon as thou upon the beckoning buds. It is winter where I live. All things are cold and white, and my soul flies only above fresh fields of flowerless snow. But no blast can chill its wings, no mire be-draggle, or rude touch fray. I often wonder whether thou art mute, or the divine framework of winged melodies. Thy very wings are shaped like harps for the winds to play upon. So, too, my soul is silent never, though none

can hear its music. Dost thou know that I am held in exile in this world that I inhabit? And dost thou know the flower that I fly ever towards and cannot reach? It is the white flower of eternal perfection that blooms and waits for the soul in Paradise. Upon that flower I shall some day rest my wings as thou foldest thine on a faultless rose."

Harmonizing with this growing passion for the beauty of the world—a passion that marked her approach to perfect womanhood—was the care she took of her person. The coarse, flowing habit of the order gave no hint of the curves and symmetry of the snow-white figure throbbing with eager life within; but it could not conceal an air of refinement and movements of the most delicate grace. There was likewise a suggestion of artistic study in the arrangement of her veil, and the sacred symbol on her bosom was embroidered with touches of superfluous elaboration.

It was when she had grown weary of books and playing the imaginary drama of her life, when even the animated loveliness of Nature had begun to seem the cold silence of material things, that Sister Dolorosa was sent by the Mother Superior on those visits of sympathy to old Martha Cross; and it was during her return from one of them that there befell her that adventure which she had deemed too slight to mention.

III.

HER outward history was that night made known to Gordon Helm by old Martha Cross. When Sister Dolorosa passed him he followed her at a distance until she entered the convent gates. It caused him a subtle pain to think what harm might be lurking to ensnare her innocence. And yet a still subtler pain shot through him as he turned away, leaving her housed within that inaccessible fold.

Who was she, and from what mission returning alone at such an hour across those darkening fields? He had just come to the edge of the corn and started to follow up the path in quest of shelter for the night, when he had caught sight of her on the near hilltop, outlined with startling distinctness against the jasper sky and bathed in a tremulous sea of lovely light. He had all but held his breath as she had turned and advanced towards him. He had watched the play of emotions in her face as she paused a few yards off. He had caught the very breath of her surprise at the discovery of him—the timid start; the rounding of the fawnlike eyes; the vermeil tint overspreading the transparent purity of her skin: her whole nature disturbed like a wind-shaken anemone. Then with entire trustfulness

she had passed so close that with a step forward he could have touched her. All this he now remembered as he returned along the footpath. It brought him to the door of the farmhouse, where he arranged to pass the night.

"You are a stranger in this part of the country," said the old housewife an hour later.

When he came in she had excused herself from rising from her chair by the chimney-side; but from that moment her eyes had followed him—those eyes of the old which follow the forms of the young with such despairing memories. By the chimney-side sat old Ezra, powerful, stupid, tired, silently smoking, and taking little notice of the others. Hardly a chill was in the air, but for her sake a log blazed in the cavernous fireplace and threw its flickering light over the guest who sat in front.

He possessed unusual physical beauty—of the type sometimes found in the men of those Kentucky families that have descended with little admixture from English stock; body and limbs less than athletic, but so formed for strength and symmetry that he might fitly have stood in a company of young Greeks stripped for the games; hair brown, thick, and slightly curling over the forehead and above the ears; complexion blond, but mellowed into rich tints from sun and open air; eyes of dark gray-blue, beneath brows low and firm; a mustache golden-brown, thick, and curling above lips red and sensuous; a neck round and full, and bearing aloft a head well poised and molded. The irresistible effect of his appearance was an impression of simple joyousness in life. There seemed to be stored up in him the warmth of the sunshine of his land; the gentleness of its fields; the kindness of its quiet landscapes. And he was young—so young! To study him was to see that he was ripe to throw himself heedless into tragedy; and that for him, not once but nightly, Endymion fell asleep to be kissed in his dreams by vanishing love.

"You are a stranger in this part of the country," said the old housewife, observing the elegance of his hunting-dress and his manner of high breeding.

"Yes; I have never been in this part of Kentucky before." He paused; but seeing that some account of himself was silently waited for, and as though wishing at once to despatch the subject, he added: "I am from the blue-grass region, perhaps about a hundred miles northward of here. A party of us were on our way farther south to hunt. On the train we fell in with a gentleman who told us he thought there were a good many birds around here, and I was chosen to stop over to ascertain. We might like to try this neighborhood

as we return, so I left my things at the station and struck out across the country this afternoon. I have heard birds in several directions, but had no dog. However, I shot a few doves in a cornfield."

"There are plenty of birds close around here, but most of them stay on the land that is owned by the Sisters, and they don't like to have it hunted over. All the land between here and the convent belongs to them except the little that's mine." This was said somewhat dryly by the old man, who knocked the ashes off his pipe without looking up.

"I am sorry to have trespassed; but I was not expecting to find a convent out in the country, although I believe I have heard that there is an abbey of Trappist monks somewhere down here."

"Yes; the abbey is not far from here."

"It seems strange to me. I can hardly believe that I am any longer in Kentucky," he said musingly, and a solemn look came over his face as his thoughts went back to the sunset scene.

The old housewife's keen eyes and sympathies pierced to his secret mood.

"You ought to go there."

"Do they receive visitors at the convent?" he asked quickly.

"Certainly; the Sisters are very glad to have strangers visit the place. It's a pity you had n't come sooner. One of the Sisters was here this afternoon, and you might have spoken to her about it."

This intelligence threw him into silence, and again her eyes fed upon his firelit face with inappeasable hunger. She was one of those women, to be met with the world over and in any station, who are remarkable for a love of youth and the world, which age, sickness, and isolation but deepen rather than subdue; and his sudden presence at her fireside was more than grateful. Not satisfied with what he had told, she led the talk back to the blue-grass country, and got from him other facts of his life, all the while asking questions in regard to the features of that more fertile and more beautiful land. In return she sketched the history of her own region, and dwelt upon its differences of soil, people, and religion — chiefly the last. All her conversation had a rude and effective eloquence, made the more telling by faculties long pent up and now gratefully exercised. It was while she spoke of the Order of the Stricken Heart that he asked a question he had long reserved.

"Do you know the history of any of these Sisters?"

"I know the history of all of them who are from Kentucky. I have known Sister Dolorosa since she was a child."

"Sister Dolorosa!" The name pierced him like a spear.

"The nun who was here to-day is called Sister Dolorosa. Her real name was Pauline Cambon."

The fire died away. The old man left the room on some pretext, and did not return. The story that followed was told regretfully, with many details not given here — traced up from parentage and childhood with that fine tracery of the feminine mind which is like intricate embroidery, and which leaves the finished story wrought out on the mind like a complete design, with every point fastened to the sympathies.

As soon as she had finished he rose quickly from a desire to be alone. So well had the story been knit to his mind that he felt it an irritation, a binding pain. He was bidding her good-night when she caught his hand and held it. Something in his mere temperament drew women towards him.

"Are you married?" she asked, looking into his eyes in the way with which those who are married sometimes exchange confidences.

He looked quickly away, and his face flushed a little fiercely.

"I am not married," he replied, withdrawing his hand.

She threw it from her with a slight gesture of mock, pleased impatience; and when he had left the room, she sat for a while over the cold ashes.

"If she were not a nun" — then she laughed to herself, and made her difficult way to her bed. But in the room above he sat down to think.

Was this, then, not romance, but life in his own State? Vaguely he had always known that farther south in Kentucky a different element of population had settled, and extended into the New World that mighty cord of ecclesiastical influence which of old had braided every European civilization into an iron tissue of faith. Vaguely he had known that upon entering that poorer, homelier region one might come into a domain of monasteries and convents. But this knowledge had never touched his imagination. In his own land there were no rural Catholic churches, much less convents, and even among the Catholic congregations of the neighboring towns he had not many acquaintances and fewer friends.

To descend as a gay bird of passage, therefore, upon these secluded, somber fields, and find himself in the neighborhood of a powerful order — to learn that a girl, beautiful, accomplished, of wealth and high social position, had of her own choice buried herself for life within its bosom — gave him a startling insight into Kentucky history as it was forming in his own time. Moreover — and this touched him

especially—it gave him a deeper insight into the possibilities of woman's nature; for a certain narrowness of view regarding the true mission of woman in this world belonged to him as a result of education. In the conservative Kentucky society by which he had been largely molded the opinion prevailed that woman fulfilled her destiny when she married well and adorned a home. All beauty, all accomplishments, all virtues and graces, were but means for attaining this end and enlarging this sphere. That she should be trained for anything else—separated bodily from a plain and imperative system of providential adaptations in order that she might indulge a solitary passion, whether for any art or profession or religion—was an advance in social philosophy not there received with much favor or enforced by many illustrations.

Moreover, he came of a stock which throughout the generations of Kentucky life, and back of these along the English ancestry, had stood above all things else for the home; a race of men with the fireside traits; sweet-tempered, patient, and brave; well-formed and handsome; cherishing towards all women a sense of chivalry; protecting them fiercely and tenderly; loving them romantically and quickly for the sake of beauty; marrying early, and sometimes at least holding towards their wives such faith that these had no more to fear from all other women in the world than from all other men.

Descended from such a stock and molded by the social ideals of his region, Helm stood most of all things for the home himself. And yet there was a difference. In a sense he was a product of the new Kentucky. His infancy had been rocked on the hither edge of the chasm of the civil war; his childhood spent amid its ruins; his youth ruled by two contending spirits—harsh, dying discord, and ever milder peace; and earliest manhood had come to him only in the morning of the new era. It was because the path of his life had thus run between the boundary of light and shade that his nature was partly joyous and partly grave; only joy claimed him entirely as yet, while gravity asserted itself merely in the form of sympathy with anything that suffered, and a certain seriousness touching his own responsibility in life.

Reflecting on this responsibility while his manhood was yet forming, he felt the need of his becoming a better and a broader type of man, matching the better and broader age. His father was about his model of a gentleman; but he should be false to the admitted progress of the times were he not an improve-

ment on his father. And since his father had, as judged by the ideals of the old social order, been a blameless gentleman of the rural blue-grass kind, with farm, spacious homestead, slaves, leisure, and a library,—to all of which, except the slaves, he would himself succeed upon his father's death,—his dream of duty took the form of becoming a rural blue-grass gentleman of the newer type, reviving the best traditions of the past, but putting into his relations with all his fellow-creatures an added sense of helpfulness, a broader sense of justice, and a certain energy of leadership in all things that made for a purer, higher human life. It will thus be seen that he took seriously not only himself, but also the reputation of his State; for he loved it, people and land, with broad, sensitive tenderness, and never sought or planned for his future apart from civil and social ends.

It was perhaps a characteristic of him as a product of the period that he had a mind for looking at his life somewhat abstractedly and with a certain thought-out plan; for this disposition of mind naturally belongs to an era when society is trembling upon the brink of new activities and forced to the discovery of new ideals. But he cherished no religious passion, being committed by inheritance to a mild, unquestioning, undeviating Protestantism. His religion was more in his conduct than in his prayers, and he tried to live its precepts instead of following them from afar. Still, his make was far from heroic. He had many faults; but it is less important to learn what these were than to know that, as far as he was aware of their existence, he was ashamed of them, and tried to overcome them.

Such, in brief, were Pauline Cambron and Gordon Helm: coming from separate regions of Kentucky, descended from unlike pasts, molded by different influences, striving towards ends in life far apart and hostile. And being thus, at last they slept that night.

When she had been left alone, and had begun to prepare herself for bed, across her mind passed and repassed certain words of the Mother Superior, stilling her spirit like the waving of a wand of peace: "To be troubled without any visible cause is one of the mysteries of our nature." True, before she fell asleep there rose all at once a singularly clear recollection of that silent meeting in the fields; but her prayers fell thick and fast upon it like flakes of snow, until it was chastely buried from the eye of conscience; and when she slept, two tears, slowly loosened from her brain by some repentant dream, could alone have told that there had been trouble behind her peaceful eyes.

CAN A NATION HAVE A RELIGION?

CAN a nation have a religion?

This is the question to which in this paper I invite attention.

It is not the question whether the state should have a church.

That the church is stronger for not being supported by the state, that the state is purer for not being dominated by the church, will not be doubted by any considerable number of American readers. For Americans the absolute separation of church and state may be regarded as settled, at least in theory. We have yet something to do to make our practice consistent with our theory; but the theory is not open to discussion. Nor is it the question whether the state should have a theology; whether a creed, however simple, should be incorporated in the Constitution, as for example a declaration of belief in the Bible, or in Christ, or in God. This is indeed proposed by some of our fellow-citizens, and has recently been approved, I believe, by one of our political parties. But this is not the question which I desire here to discuss. Without discussing it, it is legitimate to say that I do not think the Constitution of the United States is a proper place for the insertion of a system of theology or even an article of religious belief, however simple. The function of a constitution is to define and limit the powers of the various departments of the government, not to declare the religious belief of the people who constitute that government. Nor is it the question whether the individual citizens who constitute the nation should be religious individuals; whether they should possess religious beliefs, be inspired by religious motives, and controlled in their actions by religious principles. It is not the question whether in their political action as citizens they should be governed by the same religious considerations by which they are governed in their domestic, their business, and their church lives; whether they should carry their religion into their politics. This will not be a question to any one who really believes in religion at all. Religion is nothing if it is not a rule of life and of the whole life; a man is not religious at all if he is not religious in every part of his nature, at all times, and in all circumstances. The question which I wish to put before the readers of THE CENTURY MAGAZINE is whether the nation, as a nation, should have a religion; or whether the separation of church and state in-

volves also the separation of the nation and religion. A pamphlet of a modern writer lies before me, which contains the following declaration:

Religion is a matter of individual conviction or of individual belief; it must therefore, like all matters of conviction, be left to the individual.

This is plausible; is it also true? Has a nation a religious life — to be influential in determining national questions, to be controlling in determining national policy, to be expressed in national legislation? Or is a nation, as a nation, a purely unreligious organization? There are not a few persons who entertain this latter opinion, partly because they have not thought deeply on the subject, and have confounded religion with theology (that is, with the philosophy of religion), or with the church (that is, with the instituted forms of religion); partly because they do not see how it is possible that a nation made up of individuals of such various, and even antagonistic, faiths as the American people can yet possess one religion; partly because they see the curse which has fallen on other nations, who either have been separated into hostile camps by hostile religious faiths, as Ireland into Roman Catholics and Orangemen, or have been oppressed by the despotism of a hierarchy, as Spain in the fifteenth century by the power of a Papal priesthood, or Massachusetts in the seventeenth century by the power of a Protestant autocracy. They believe that religion is the inspired guide of the individual, that it should govern the citizen, that it is the bond of the family, that in his religious rights the person should be protected by the state, but that the state itself not only need not be but cannot be religious; that to treat all religions with impartiality it must ignore religion altogether. There are, however, some considerations which should at least give pause in accepting as an axiom that "religion is a matter of individual conviction" exclusively; and should lead one to think twice before accepting the conclusion that the American nation should be or ever can be a purely secular — that is, an unreligious — organization.

I. The questions which confront the American people are largely religious questions. That is, they are questions to be determined by religious considerations, and upon religious principles. They are not questions of experi-

ence, but of moral principle. Events ask the nation not What is wise? but What is right? and the nation must answer. And in answering, it formulates to that extent a religious faith and incorporates that faith in its organic law. Such a question addressed itself to the colonies in 1776, and the first sentence of the immortal Declaration of Independence was emphatically a declaration of religious faith: "We hold these truths to be self-evident, that all men are created equal; that they are endowed by their Creator with certain unalienable rights; that among these are life, liberty, and the pursuit of happiness." There are no rights that are not duties. The Declaration of Independence was not justified if it was not obligatory. The War of the Revolution was treason if it was not a defense of a sacred trust. This was the declared faith of our fathers—that God had intrusted to them certain rights which they could not alienate without dishonor, and thus their faith was as emphatically a religious faith as that of the Council of Nicæa or that embodied in the Athanasian Creed. The great questions which confront the American Republic to-day are in like manner essentially religious questions. They ask the nation, not What is profitable? but What is duty? The Mormon question, the Divorce question, the Temperance question, the Indian question, the Negro question, the Labor question, the Prison Reform question, the Public School question, the Woman Suffrage question, the Tariff question, are all essentially religious questions. In a large measure their religious character is recognized by the press and the platform. The more effective writers and speakers are those who recognize the profounder aspect of these problems and address themselves, not to the self-interest but to the conscience of the nation. And they cannot be solved, it must be noted, by individuals acting religiously; they can be solved only by the religious action of the nation in its national capacity. We cannot solve either the Mormon or the Divorce question by individuals resolving to be content with one wife apiece; the question still remains, What will the nation do with polygamy, with the plurality of wives, contemporaneous or successive? What ought we to do? Does liberty demand that we leave polygamy alone? Does purity demand that we prohibit it? Personally taking the pledge does not solve the problem presented by the saloon. What is the duty of the nation towards the liquor traffic; not of the individual to patronize or not patronize, but of the state to protect, to restrict, or to prohibit? Ought the nation to regard alcoholic liquors as legitimate merchandise, like wool or cotton, the manufacture and the sale of which is to be protected if not promoted,

or as an extra-hazardous article like nitroglycerin or arsenic, the sale of which is to be carefully regulated and narrowly restricted, or as a positively pernicious article like diseased meats or infected garments, the sale of which we absolutely prohibit? This is a question for the nation to decide as a nation; its decision will be expressed by and incorporated in national legislation;¹ and this action, whatever it is, will be a religious action, that is, an action of the moral nature, in the moral realm, governed by moral considerations. The Indian and the Negro questions are both phases of one and the same question: what duties, if any, do a superior race owe to an inferior and subject race, living in the same territory, under the same government, parts of the same nation? The question cannot be answered by individual philanthropy or by missionary societies; the question is asked of the nation, and the nation only can answer it. If the law "Thou shalt love thy neighbor as thyself" is a religious law, if the question "Who is my neighbor?" is a religious question, then the Indian and the Negro problems are religious problems. For their solution demands the application of this law, and requires an answer to these questions. So of every problem which confronts our State or national organizations to-day. Labor reform: What duty, if any, of protection does the law owe to the individual wage-earner against the possible aggression of organized capital? The prison question: What is the object of punishment?—since all punishment which is not directed to the true end of punishment is essentially unjust and iniquitous. The public school question: What are the co-relative rights and duties of nation, church, and parent in the education of the children who are to become the citizens and governors of the commonwealth? Woman suffrage: What duty does woman owe the state? Is she exempt from bearing its political burdens as from its jury, its police, and its militia? The tariff question: What duty does the nation owe of self-protection and self-help? What duty of consideration and brotherhood to the other nations of the earth? Not only in deciding these questions must the individual voter be controlled by religious principles, but their decision incorporates in the nation a religious principle. It becomes by its legislation monogamous or polygamous; an oppressor or an emancipator of its subject races; an accessory before the fact to robbery perpetrated by one class on another, or an impartial defender of each class from the aggressions of any other; an avenger or a curer of crime.

¹ Or in State legislation. For the preface of this article the distinction between the State and the nation may be ignored.

II. While thus each separate problem presented to the nation to-day is with us a religious question,—and it would be easy to show that this is equally true of the problems of English, French, and German national life,—they are all parts of one comprehensive problem which it is even more apparent is essentially religious in its character. While every new decision of the nation on the questions thus separately presented to it incorporates in the nation a certain definite religious element (or, if the reader prefer the term, a definite moral element), the decision of the aggregate of these questions gives to the nation's life a moral tendency and to its personality a moral quality. England and Spain were in the sixteenth century rivals and peers. They have since, by successive acts of legislation and resultant constitutional changes, moved along two divergent paths of national development. One has unconsciously to itself been working out in its character the principle, One is your Master which is in heaven and all ye are brethren : it has moved along the pathway of a democratic development. The other has, perhaps equally unconsciously, developed in its people only one virtue, that of obedience, and in its rulers only one obligation, that of maintaining their authority ; it has moved along the pathway of an aristocratic development, in church and state. And these two national movements have resulted after three centuries of national growth in the England and the Spain of to-day. The product is a moral product ; the process was a moral process. A state is made religious, not by incorporating a creed in its written constitution, but by such a habit of national life as develops a type of national character.

In our country to-day all the problems of our national life are parts of one generic problem, How shall we develop a brotherhood of man ? This is the problem given to us to work out. Our vast territory ; our great variations of climate, soil, and wealth, encouraging every form of industry, agriculture, mining, manufacture, commerce, domestic and international ; our heterogeneous population, made up of every race, color, tribe, tongue, nationality, and religious opinion ; our great social differences, nowhere greater—millionsaires on the one side, masses of pauperism on the other ; our perpetual intermixture of classes, facilitated by the modern ease of locomotion, by the universal circulation of the newspaper press, by a common school system of education, by the absence of hereditary barriers and the easy passing of men from one class into the other ; the rapid increase of our great cities and the consequent massing of populations in centers ; the perpetual attrition of men

of various classes, characters, avocations, temperaments, and faiths against each other ; our political institutions throwing all together into one great debating society at every political campaign, and making the subject of yesterday the ruler of to-morrow, and the ruler of yesterday the subject of to-morrow ; the problems of our national life—the slavery question, the secession question, the temperance question, the race question, the immigration question, the various forms of the industrial question—all these are elements entering into and constituting one great problem, the problem of human brotherhood. The question which it is our destiny to study, the problem which it is our duty to solve, is, How can such a conglomerate population live in peace and promote one another's well-being ? What are their co-relative duties to one another ? What are the limits of the liberty of the individual ? What are the duties which the all owe to the one ? What are the limits of the power of the nation ? What are the rights of the one which the all must not infringe ? What bonds can be trusted to bind together in one harmonious and self-governed state those who are not bound together by force, like the staves of a barrel by its hoops, and who are separated from one another by the most divergent characters, opinions, prejudices, and education ? Now this is essentially a religious problem. No nation can solve it without a religion. Its solution will be in the profoundest sense a religious act ; the result of that solution will be in the profoundest sense a religious nation. For the brotherhood of man is as truly a religious conception as the Fatherhood of God. Indeed the one is not thinkable without the other. If we are all brethren it is because we have one Father. An atheistic democracy is a contradiction in terms.

III. In dealing with these problems of its national life the nation acts—must act from religious motives and must feel religiously. The nation is not a mere aggregate of individuals. Fifty millions of people on three millions of square miles of territory do not constitute the United States of America. A million or so of people occupying twenty-one thousand square miles did not constitute Greece. It was the Greeks who constituted Greece ; it is Americans who constitute America. So many people thrown together on one territory no more make a nation than so many blocks of stone thrown together in a pile make a temple, or so many types in pi a book, or so many threads in a tangle a fabric. Every nation has its own distinguishing features, its own type of character, its own consciousness, its own life. To constitute a nation there must be not only people and land and laws, but

laws that are self-evolved, literature that is the expression of national life, language fitted to express that life, and therefore a life to be expressed. And if the nation is ever to count for anything among the nations, that life must be not merely animal, or social, or industrial; it must and will be also religious. The nation has a brain, it thinks; a heart, it feels; a will, it resolves. This brain must perceive the higher moral truths, or the nation cannot comprehend its problems, much less its destiny. This heart must feel the higher moral emotions, or it cannot solve its problems, much less achieve its destiny. A nation that cannot feel, cannot do; a nation that cannot feel nobly, cannot do nobly. But to see moral truths, to feel moral emotions, and to do moral deeds is religious; to recognize in moral truths the highest of all truths, to yield to moral emotions as the highest of all motive powers, and to be guided in practical conduct by moral truths and ruled by the moral motive powers, is to live religiously. The nation is subject like the individual to passions. Gold is discovered in California; the passion of gold sweeps a multitude across the continent and round by the Isthmus to dig for it. A cannon blazes forth against the flag on Fort Sumter; a passion of patriotism sweeps over the nation and the seventy-five thousand answer to President Lincoln's call almost before the call is issued. Shall the nation then feel only the passion of avarice and not the passion of patriotism? Shall it be moved by covetousness, by party zeal, by pride of blood, and not by reverence, by fidelity, by honor, by sense of duty to God, to posterity? But reverence, fidelity, honor, the sense of duty towards God and posterity, are all religious emotions, profoundly religious emotions. A people without churches, monuments, museums, centennials, national songs, would be a people without power to meet any great crisis or achieve any great deed. Fletcher of Saltoun's saying, "If a man were permitted to make all the ballads, he need not care who should make the laws, of a nation," expresses a profound truth, because the songs which create as well as express the emotions make the nation, while the laws are simply restraints upon it or acts done by it. Only a people who could sing "America" could have fought to a successful issue the American Revolution; only a people who could sing the "Battle Hymn of the Republic" could have fought to a successful issue the Civil War. On the other hand, one might have forecast the issue of the French Revolution from hearing the "Marseillaise."

The nation has recently brought to a close its celebration of the Centennial of the estab-

lishment of its Constitution and the inauguration of George Washington as first President of the United States. Incalculable time, strength, and money were expended on a mere sentiment — the sentiment of reverence and affection and honor for a noble ancestry, noble deeds, and a country which they have ennobled. Such a sentiment saves the country from the opprobrious character which has been given to England in the phrase, "A nation of shopkeepers." It was not true of England; it is not true of America. But this sentiment, which sacrifices time, money, strength to give joyous expression to reverence, affection, honor, is essentially a religious sentiment and found its fitting expression in the religious services at St. Paul's, Trinity, and other churches in New York City and elsewhere, and in the joining of Dr. R. S. Storrs and Archbishop Corrigan in the simple religious services which accompanied the public address on the spot where Washington took the oath of office. To deprive a nation of these religious emotions would be to deprive it of its life — of the very bond which binds it together and makes it a nation.

IV. But the possession of a religious life is not only essential to enable the nation to solve aright its great problems which are essentially religious, to fulfil its destiny, which can never be fulfilled without a religious conception in the nation, and to live nobly and heroically, for which religious emotions are a very necessary equipment; without religion it cannot even fulfil its first and simplest function. Some irony has been heaped by the modern school of political economists on what they call the night-watchman theory of government; but the first duty, though by no means the sole duty, of government is to be a night-watchman. Its primary function, that which underlies all the rest, is to administer justice between man and man; to protect the individual from the aggressions of other individuals; to maintain liberty by defending it; to punish crime and to prevent it — and this is essentially a religious function. Justice is as truly a religious act as worship; and justice is the first duty of the nation. To do justly and to love mercy were the first two elements in the old Hebrew prophet's definition of religion, and no nation can fulfil its true functions which does not both do justice and love mercy. The first is scarcely at all, the second is by no means exclusively, the action of the individual; and neither concerns the individual alone: therefore religion does not concern the individual alone. Justice must be the basis of the nation's laws; justice the characteristic of the nation's courts; justice the end of the nation's systems of jurisprudence, both criminal and civil. Most of the readers of this article will

probably agree that the Bible is essentially a religious book; let them take down a copy of the Bible and see how large a proportion of it is given either to an exposition of the principles of justice, the application of those principles to specific cases, or the history of the administration of such justice, either between man and man in government, or between God and man in history.

But more than this. Modern penologists are rapidly coming to the conclusion that mercy and justice are not at variance, but that the truest mercy is also the only justice. Reformatory methods are taking the place of punitive methods in all our systems of criminal administration. We are discovering that the only way to protect society from crime is to cure the criminal of his criminal disposition. We are establishing reformatories and penitentiaries in the place of jails and prisons; we are establishing schools in our State prisons; we are beginning to organize our system of prison labor not to make penal servitude hard, but to make industry in the convict a habit; we are trying the experiment of an indeterminate sentence, treating the criminal as diseased, the prison as a hospital, and sending the convict to prison as the lunatic to an asylum, until he is cured. But as it is the lowest and first function of religion to restrain men, so it is the last and highest function of religion to redeem them, to put into them such springs of action, to form in them such habits of action, that they will require no restraint not self-imposed. Thus it would appear that the function of religion and the function of the nation are in so far identical. They both aim to restrain men from evil courses; they both aim to redeem men from evil influences and habits. In short the highest function of religion is also the fundamental function of the nation, namely, moral cure. There is indeed a difference. The nation only aims to cure men of those vices which make them dangerous to society; while religion goes beyond this and aims to cure men of sin as well as of crime. But the nation cannot even enter upon its task of administering justice, which in these later days we have learned is also an administration of mercy, without exercising a fundamental function of religion—the twofold function of justice and mercy. How can a nation, organized primarily for this very purpose, fulfil its first and fundamental duty, that for which it exists, and without which there would be no excuse for its existence, if it have not a true religious life?

V. This religious life is indispensable not only to justify the existence of the nation, but even to make the existence of the nation possible; and this is preëminently true of a democratic nation, that is, of a nation that avowedly

derives its powers from the consent of the governed. Says Lord Macaulay:

The day will come when in the State of New York a multitude of people, not one of whom has had more than half a breakfast, or expects to have more than half a dinner, will choose a legislature. Is it possible to doubt what kind of a legislature will be chosen? On one side is a statesman preaching patience, respect for vested rights, strict observance of public faith; on the other is a demagogue, ranting about the tyranny of capitalists and usurers, and asking why anybody should be permitted to drink champagne and to ride in a carriage, while thousands of honest folks are in want of necessities. Which of the two candidates is likely to be preferred by the workingman who hears his children crying for more bread? I seriously apprehend that you will, in some such season of adversity as I have described, do things which will prevent prosperity from returning. Either some Cæsar or Napoleon will seize the reins of government with a strong hand, or your Republic will be as fearfully plundered and laid waste by barbarians in the twentieth century as the Roman Empire was in the fifth; with this difference—that the Huns and Vandals who ravaged the Roman Empire came from without, and that your Huns and Vandals will have been engendered within your own country and by your own institutions.

Who will say in the light of recent events, and in the presence of living personages, that the American soil can beget no such demagogue, produce no such legislature, breed no such Huns and Vandals? If the danger thus predicted by Lord Macaulay—foreseen also by others, more than he believers in popular government and more nearly sympathizing with American institutions—is to be guarded against, and the possible tragic consummation prevented, it must be by the power of religion in the nation, on the one hand inspiring the rich and prosperous with a regard for the well-being of their less fortunate fellow-citizens, which Lord Macaulay assumes they will not possess, and on the other hand the poor and less fortunate with a regard for the rights of the individual, which Lord Macaulay also does not impute to them. For a people urged on by such passions as he hints at must be restrained either by force from without or by force from within. Force without is despotism; force within is religion. A people who are governed by their conscience are governed by religion; a people reverential to law which has no other sanction than the invisible sanctions of God and an immortal future are reverential to religion. A people who acknowledge no reverence to such divine law and yield allegiance to no such inward monitor will be the prey to their own animal appetites and passions, unless they are restrained therefrom by

the lowest of all the animal passions, that of physical fear.¹

The wise man will not scoff at this foreseen peril to a democratic state whose people know neither the restraints nor the inspirations of religion. He will remember that history abundantly verifies the teaching of philosophy that no despotism is greater or more to be dreaded than the despotism of an unrestrained democracy. "For myself," says De Tocqueville, "when I feel the hand of power lie heavy on my brow, I care but little to know who oppresses me; and I am not the more disposed to pass beneath the yoke because it is held out to me by the arms of a million of men."

The French Revolution has shown what sort of despotism it is which a multitude of men unrestrained by religion are liable to establish. One needs only to refer to the Jacobin program as M. Taine has set it forth in his graphic picture of that epoch in the history of human governments. "Opulence," writes Saint-Just, "is infamous." "The richest Frenchman," says Robespierre, "ought not to have more than three thousand livres rental." "It is not enough," says Barère, "to bleed the rich; to pull down colossal fortunes; the slavery of poverty must be made to disappear from the soil of the Republic." Says Taine, embodying in his own language the legislation of the atheistic Republic:

We make monopoly a "capital crime"; we call him a monopolist who takes food and wares of prime necessity out of circulation, and keeps them stored without daily and publicly offering them for sale. Penalty of death against whoever, within eight days, does not make a declaration, or if he make a false one; penalty of death against any person who keeps more bread on hand than he needs for his subsistence; penalty of death against the cultivator who does not bring his grain weekly to market; penalty of death against the dealer who does not post up the contents of his warehouse, or who does not keep open shop; penalty of death against the manufacturer who does not verify the daily use of his workable material. As to prices, we intervene authoritatively between buyer and seller; we fix the extreme price for all objects which, near

¹"Despotism may govern without faith," says De Tocqueville, "but liberty cannot. Religion is much more necessary in the republic which they [the atheistic republicans] set forth in glowing colors than in the monarchy which they attack; it is more needed in democratic republics than in any others. How is it possible that societies should escape destruction if the moral tie be not strengthened in proportion as the political tie is relaxed? And what can be done with a people who are their own masters, if they be not submissive to the Deity?"

"Suppose," says Professor Bryce, looking in imagination at the throngs of eager figures streaming through the streets of an American city—"suppose that all these men ceased to believe that there was any power above them, any future before them, anything in heaven or earth but what their senses told them of;

or remotely, serve to feed, warm, or clothe man; we will imprison whoever offers or demands anything more. Whether the dealer or manufacturer pays expenses at this rate matters not; if, after the maximum is fixed, he closes his factory, or gives up business, we declare him a "suspect"; we chain him down to his pursuit, we oblige him to lose by it. That is the way to clip the claws of beasts of prey, little and big!

What shall prevent democracy from repeating this despotism except the life of religion wrought into the life of the nation? And to what end can such a democracy come other than the one to which such unreligious democracies have ever come—the welcoming of the despotic authority of one man as infinitely preferable to the despotic authority of the million?

It can hardly be necessary to quote from authorities either ancient or modern to show that the notion that a nation is or can be unreligious has no support from philosophers or statesmen. It would indeed be difficult to mention the name of a single man eminent in statecraft who has not been, avowedly at least, a believer in the Deity, and who has not based his statesmanship on the reality and invincibility of divine laws. It would be difficult to mention a political philosopher who has not more or less distinctly recognized religion as at once the foundation of the state and the inspiration of its life. "Of all the dispositions and habits," says George Washington, "which lead to political prosperity, religion and morality are indispensable. In vain would that man claim the tribute of patriotism who should labor to subvert these great pillars of human happiness, these fundamental props of the duties of men and citizens." He who advocates the notion that a nation can be unreligious, and that religion is merely a matter of individual conscience, is, consciously or unconsciously, laboring to subvert these pillars of human happiness. He who honestly entertains such a notion must, it seems to me, do so because he confounds religion with either wor-

suppose that their consciousness of individual force and responsibility, already dwarfed by the overwhelming power of the multitude, and the fatalistic submission it engenders, were further weakened by the feeling that their swiftly fleeting life was rounded by a perpetual sleep—would the moral code stand unshaken, and with it the reverence for law, the sense of duty towards the community, and even towards the generations yet to come? Would men say, 'Let us eat and drink, for to-morrow we die'? Or would custom, and sympathy, and a perception of the advantages which stable government offers to the citizens as a whole, and which orderly self-restraint offers to each one, replace supernatural sanctions, and hold in check the violence of masses and the self-indulgent impulses of the individual?"

ship, theology, or the church. It is not necessary for the nation to establish a form of worship, or to proclaim its adherence to a system of theology, or to give its support to a church or churches, in order to be profoundly and deeply religious. It is necessary that it should be something more than a mere aggregate of individuals engaged in promoting their own self-interest, and combined in a kind of insurance society to protect one another from the aggression of criminals. It is necessary that it should think, and feel, and act religiously, that it may solve the problems which are constantly presented to it; that it may fulfil its national destiny; that it may possess a true national life; that it may perform aright its first and fundamental function, the administration of justice; that it may even obey the law of self-preservation. If so, while it need not and ought not to give support to ecclesiastical institutions, it ought to recognize the necessity of institutional religion. If it undertakes to teach the children of the commonwealth at all, it ought to teach them those religious principles and imbue them with that religious spirit which is essential to national life; if it undertakes to reform criminals, it ought to select those principles and methods which expe-

rience indicates to be most efficacious to that end; it ought not to impose ecclesiastical observances on any of its citizens, or require as a condition of its protection, its offices, or its honors, the acceptance of any ecclesiastical tests; but it ought to protect all religious institutions as equally entitled to its protection, because they all seek to promote that religious life on which the life of the nation depends; it ought to recognize by law days set apart to the offices of religion by the great body of the avowedly religious teachers and organizations, as it recognizes days set apart by a common desire to the offices of patriotism; it ought to continue to recognize the offices of religion by public and official act on special days and special occasions, as it recognizes the inauguration of its President or the celebration of its birthdays. In short, recognizing at once the necessity of religious life to the maintenance of its own life, and the impossibility of securing from its citizens any common agreement as to the methods by which that life shall be maintained and promoted, the nation should in a reverent spirit recognize all methods employed to that end, and, giving to neither a favorite's support, should give to all a common recognition and encouragement.

Lyman Abbott.

ECCE SIGNUM.

(IN MEMORY OF E. C. K.)

IN the dark night, the night of sleep,
I, gazing upward through the deep,
See thee, pale moon, thy vigil keep.

Thou hauntest earth though thou art dead.
A wandering specter, garmented
In ghostly luster overhead.

Marvel, O heart, that death can hold
Such fire, drawn from the burning gold
Of the great sun, and yet be cold;

That death, so clothed in radiant light,
A glory in the gloom of night,
Is yet itself but dust and blight.

Sweet face! thou, too, dost sacred shine,
Though dead; foreshadowing some divine,
Undying beauty, as a sign

That death is life beyond — afar,
Reviving in some peerless star,
Where souls beloved immortal are.

Stephen Henry Thayer.

MARTHY VIRGINIA'S HAND.

"**T**HERE, on the left!" said the colonel: the battle had shuddered and faded away, Wraith of a fiery enchantment that left only ashes and blood-sprinkled clay — "Ride to the left and examine that ridge, where the enemy's sharpshooters stood. Lord, how they picked off our men, from the treacherous vantage-ground of the wood! But for their bullets, I 'll bet, my batteries sent them something as good. Go and explore, and report to me then, and tell me how many we killed. Never a wink shall I sleep till I know our vengeance was duly fulfilled."

Fiercely the orderly rode down the slope of the corn-field — scarred and forlorn, Rutted by violent wheels, and scathed by the shot that had plowed it in scorn; Fiercely, and burning with wrath for the sight of his comrades crushed at a blow, Flung in broken shapes on the ground like ruined memorials of woe: These were the men whom at daybreak he knew, but never again could know.

Thence to the ridge, where roots outthrust, and twisted branches of trees
Clutched the hill like clawing lions, firm their prey to seize.

"What 's your report?" — and the grim colonel smiled when the orderly came back at last. Strangely the soldier paused: "Well, they were punished." And strangely his face looked, aghast. "Yes, our fire told on them; knocked over fifty — laid out in line of parade. Brave fellows, Colonel, to stay as they did! But one I 'most wish had n't staid. Mortally wounded, he 'd torn off his knapsack; and then, at the end, he prayed — Easy to see, by his hands that were clasped; and the dull, dead fingers yet held This little letter — his wife's — from the knapsack. A pity those woods were shelled!"

Silent the orderly, watching with tears in his eyes as his officer scanned
Four short pages of writing. "What 's this, about ' Marthy Virginia's hand '?"
Swift from his honeymoon he, the dead soldier, had gone from his bride to the strife;
Never they met again, but she had written him, telling of that new life,
Born in the daughter, that bound her still closer and closer to him as his wife.
Laying her baby's hand down on the letter, around it she traced a rude line:
"If you would kiss the baby," she wrote, "you must kiss this outline of mine."

There was the shape of the hand on the page, with the small, chubby fingers outspread.
"Marthy Virginia's hand, for her pa," — so the words on the little palm said.
Never a wink slept the colonel that night, for the vengeance so blindly fulfilled,
Never again woke the old battle-glow when the bullets their death-note shrilled.
Long ago ended the struggle, in union of brotherhood happily stilled;
Yet from that field of Antietam, in warning and token of love's command,
See! there is lifted the hand of a baby — Marthy Virginia's hand!

George Parsons Lathrop.

A CONSCRIPT'S CHRISTMAS.

BY JOEL CHANDLER HARRIS,

Author of "Days and Nights with Uncle Remus," "Free Joe and the Rest of the World," etc.

"HOWDY, BOYS, HOWDY!"

On a Sunday afternoon in December, 1863, two horsemen were making their way across Big Corn Valley in the direction of Sugar Mountain. They had started from the little town of Jasper early in the morning, and it was

apparent at a glance that they had not enjoyed the journey. They sat listlessly in their saddles, with their carbines across their laps, and whatever conversation they carried on was desultory.

To tell the truth, the journey from Jasper to the top of Sugar Mountain was not a pleasant one even in the best of weather, and now, with the wind pushing before it a bitterly cold mist, its disagreeableness was irritating. And it was not by any means a short journey. Big Corn

Valley was fifteen miles across as the crow flies, and the meanderings of the road added five more. Then there was the barrier of the foothills and finally Sugar Mountain itself, which when the weather was clear lifted itself above all the other mountains of that region.

Nor was this all. Occasionally, when the wind blew aside the oilskin overcoats of the riders, the gray uniform of the Confederacy showed beneath, and they wore cavalry boots, and there were tell-tale trimmings on their felt hats. With these accoutrements to advertise them, they were not in a friendly region. There were bushwhackers in the mountains, and, for aught the horsemen knew, the fodder stacks in the valley, that rose like huge and ominous ghosts out of the mist on every side, might conceal dozens of guerrillas. They had that day ridden past the house of the only member of the Georgia State convention who had refused to affix his signature to

the ordinance of secession, and the woods, to use the provincial phrase, were full of Union men.

Suddenly, and with a fierce and ripping oath, one of the horsemen drew rein. "I wish I may die," he exclaimed, his voice trembling with long pent up irritation, "if I ain't a great mind to turn around in my tracks an' go back. Where does this cussed road lead to anyhow?"

"To the mountain—straight to the mountain," grimly remarked the other, who had stopped to see what was the matter with his companion.

"Great Jerusalem! straight? Do you see that fodder stack yonder with the hawk on the top of the pole? Well, we've passed it four times, and we ain't no further away from it now than we was at fust."

"Well, we've no time to stand here. In an hour we'll be at the foot of the mountain, and a quarter of a mile further we'll find shelter. We must attend to business and talk it over afterwards."

"An' it's a mighty nice business, too," said the man who had first spoken. He was slender in build, and his thin and straggling mustache failed to relieve his effeminate appearance. He had evidently never seen hard service. "I never have believed in this conscriptin' business," he went on in a complaining tone. "It won't pan out. It has turned more men agin the Confederacy than it has turned fer it, or else my daddy's name ain't Bill Chadwick, nor mine neither."

"Well," said the other curtly, "it's the law, Bill Chadwick, and it must be carried out. We've got our orders."

"Oh, yes! You are the commander, Cap'in Moseley, an' I'm the army. Ain't I the gayest army you ever had under you? I'll tell you what, Cap'in Moseley (I'd call you Dick, like I useter, if we was n't in the ranks), when I j'ined the army I thought I was goin' to fight the Yankees, but they slapped me in the camp of instruction over there at Adairsville, an' now here we are fightin' our own folks. If we ain't fightin' 'em, we are pursuin' after 'em, an' runnin' 'em into the woods an' up the mountains. Now what kind of a soldier will one of these conscripts make? You need n't tell me, Cap'in! The law won't pan out."

"But it's the law," said Captain Moseley. The captain had been wounded in Virginia, and was entitled to a discharge, but he accepted the position of conscript officer. He had the grit and discipline of a veteran, and a persistence in carrying out his purposes that gave him the name of "Hardhead" in the army. He was tall and muscular, but his drooping left shoulder showed where a Federal ball had found lodgment. His closely cropped beard was slightly streaked with

gray, and his face would have been handsome had not determination left its rude handwriting there.

The two rode on together in silence a little space, the cold mists, driven by the wind, tingling in their faces. Presently Private Chadwick, who had evidently been ruminating over the matter, resumed the thread of his complaints.

"They tell me," he said, "that it's a heap easier to make a bad law than it is to make a good one. It takes a lot of smart men a long time to make a good one, but a passel of blunderbusses can patch a bad one up in a little or no time. That's the way I look at it."

"What's the name of this chap we are after? Israel Spurlock? I'd like to know, by George, what's the matter with him! What makes him so plague-taken important that two men have to be sent on a wild-goose chase after him? They yerked him into the army, an' he yerked himself out, an' now the word is that the war can't go on unless Israel Spurlock is on hand to fling down his gun an' run when he hears a bung-shell playin' a tune in the air."

Captain Moseley coughed to hide a smile.

"It's jest like I tell you, Cap'in. The news is that we had a terrible victory at Chattanooga, but I notice in the Atlanta papers that the Yankees ain't no further north than they was before the fight; an' what makes it wuss, they are warmin' themselves in Chattanooga, whilst we are shiverin' outside. I reckon if Israel Spurlock had been on hand at the right time an' in the right place, we'd drove the Yanks plumb back to Nashville. Lord! I hope we'll have him on the skirmish line the next time we surround the enemy an' drive him into a town as big as Chattanooga."

Private Chadwick kept up his complaints for some time, but they failed to disturb the serenity of the captain, who urged his horse forward through the mist, closely followed by his companion. They finally left the valley, passed over the foothills, and began the ascent of Sugar Mountain. Here their journey became less disagreeable. The road, winding and twisting around the mountain, had been cut through a dense growth of trees, and these proved to be something of a shelter. Moreover, the road sometimes brought the mountain between the travelers and the wind, and these were such comfortable intervals that Mr. Chadwick ceased his complaints and rode along good-humoredly.

The two horsemen had gone about a mile, measuring the mountain road, though they were not more than a quarter of a mile from the foot, when they came suddenly on an old man sitting in a sheltered place by the side of the road. They came on the stranger so sud-

denly that their horses betrayed alarm, and it was all they could do to keep the animals from slipping and rolling into the gorge at their left. The old man was dressed in a suit of gray jeans, and wore a wool hat, which, although it showed the signs of constant use, had somehow managed to retain its original shape. His head was large and covered with a profusion of iron-gray hair, which was neatly combed. His face was round, but the lines of character obliterated all suggestions of chubbiness. The full beard that he wore failed to hide the evidences of firmness and determination; but around his mouth a serene smile lingered, and humor sparkled in his small brown eyes.

"Howdy, howdy!" he exclaimed. "Tired as they look to be, you er straddlin' right peart creeturs. A flirt or two more an' they 'd 'a' flung you down the hill, an' 'a' folled along attar you, headstall an' stirrup. They done like they were n't expectin' company in an' around here."

The sonorous voice and deliberate utterance of the old man bespoke his calling. He was evidently a minister of the gospel. This gave a clue to Captain Moseley's memory.

"This must be Uncle Billy Powers," said the captain. "I've heard you preach many a time when I was a boy."

"That 's my name," said Uncle Billy; "an' in my feeble way I've been a-preachin' the Word as it was given to me forty year, lackin' one. Ef I ever saw you, the circumstance has slipped from me."

"My name is Moseley," said the captain.

"I useter know Jeremiah Moseley in my younger days," said Uncle Billy, gazing reflectively at the piece of pine bark he was whittling. "Yes, yes! I knowed Brother Moseley well. He was a God-fearin' man."

"He was my father," said the captain.

"Well, well, well!" exclaimed Uncle Billy, in a tone that seemed to combine reflection with astonishment. "Jerry Moseley's son! I disremember the day when Brother Moseley come into my mind, an' yit, now that I hear his name bandied about up here on the hill, it carries me plumb back to ole times. He were n't much of a preacher on his own hook, but let 'im folled along for to clench the sermon, an' his match could n't be foun' in them days. Yit, Jerry was a man of peace, an' here 's his son a-gwine about with guns an' pistols, an' what not, a-tryin' to give peaceable folks a smell of war."

"Oh, no!" said Captain Moseley, laughing; "we are just hunting up some old acquaintances. Some friends of ours that we'd like to see."

"Well," said Uncle Billy, sinking his knife

deep into the soft pine bark, "it's bad weather for a frolic, an' it ain't much better for a straight-out, eve'y-day call. Speshually up here on the hill, where the ground is so wet and slippery-fied. It looks like you've come a mighty long ways for to pay a friendly call. An' yit," the old man continued, looking up at the captain with a smile that well became his patriarchal face, "thar ain't a cabin on the hill whar you won't be more than welcome. Yes, sir; where-somever you find a h'a'thstone, thar you 'll find a place to rest."

"So I have heard," said the captain. "But maybe you can cut our journey short. We have a message for Israel Spurlock."

Immediately Captain Moseley knew that the placid and kindly face of Uncle Billy Powers had led him into making a mistake. He knew that he had mentioned Israel Spurlock's name to the wrong man at the wrong time. There was a scarcely perceptible frown on Uncle Billy's face as he raised it from his piece of pine bark, which was now assuming the shape of a horseman's pistol, and he looked at the captain through half-closed eyelids.

"Come, now," he exclaimed, "ain't Israel Spurlock in the war? Did n't a posse ketch 'im down yander in Jasper an' take an' corn-scrip 'im into the army? Run it over in your mind now! Ain't Israel Spurlock crippled some'r's, an' ain't your message for his poor ole mammy?"

"No, no," said the captain, laughing, and trying to hide his inward irritation.

"Not so?" exclaimed Uncle Billy. "Well, sir, you must be shore an' set me right when I go wrong; but I 'll tell you right pine blank, I've had Israel Spurlock in my min' off an' on ev'ry since they run him down an' kotch him an' drug 'im off to war. He was weakly like from the time he was a boy, an' when I heard you call forth his name, I allowed to myself, says I, 'Israel Spurlock is sick, an' they've come attar his ole mammy to go an' nuss him.' That 's the idee that riz up in my min'."

A man less shrewd than Captain Moseley would have been deceived by the bland simplicity of Uncle Billy's tone.

"No," said he; "Spurlock is not sick. He is a sounder man than I am. He was conscripted in Jasper and carried to Adairsville, and after he got used to the camp he concluded that he would come home and tell his folks good-by."

"Now that 's jes like Israel," said Uncle Billy, closing his eyes and compressing his lips—"jes like him for the world. He knowed that he was drug off right spang at the time he wanted to be getherin' in his craps, an' savin' his ruffage, an' one thing an' another beca'se

his ole mammy did n't have a soul to help her but 'im. I reckon he's been a-housin' his corn an' sich like. The ole 'oman tuck on might'ly when Israel was snatched into the army."

"How far is it to shelter?" inquired Captain Moseley.

"Not so mighty fur," responded Uncle Billy, whittling the pine bark more cautiously. "Jes keep in the middle of the road an' you'll soon come to it. Ef I ain't thar before you, jes holler for Aunt Crissy an' tell her that you saw Uncle Billy some'r's in the woods an' he told you to wait for 'im."

With that Captain Moseley and Private Chadwick spurred their horses up the mountain road, leaving Uncle Billy whittling.

"Well, dang my buttons!" exclaimed Chadwick, when they were out of hearing.

"What now?" asked the captain, turning in his saddle. Private Chadwick had stopped his horse and was looking back down the mountain as if he expected to be pursued.

"I wish I may die," he went on, giving his horse the rein, "if we have n't walked right square into it with our eyes wide open."

"Into what?" asked the captain, curtly.

"Into trouble," said Chadwick. "Oh," he exclaimed, looking at his companion seriously, "you may grin behind your beard, but you just wait till the fun begins—all the grins you can muster will be mighty dry grins. Why, Cap., I could read that old chap as if he was a newspaper. Whilst he was a-watchin' you I was a-watchin' him, an' if he ain't got a war map printed on his face I ain't never saw none in the 'Charleston Mercury.'"

"The old man is a preacher," said Captain Moseley in a tone that seemed to dispose of the matter.

"Well, the Lord help us!" exclaimed Chadwick. "In about the wuss whippin' I ever got was from a young feller that was preachin' an' courtin' in my neighborhood. I sorter sassed him about a gal he was flyin' around, an' he uped an' frailed me out, an' got the gal to boot. Don't tell me about no preachers. Why, that chap flew at me like a Stonefence rooster, an' he fluttered twicet to my oncet."

"And have you been running from preachers ever since?" dryly inquired the captain.

"Not, as you may say, constantly a-runnin'," replied Chadwick; "yit I ain't been a-flingin' no sass at 'em; an' my reason tells me for to give 'em the whole wedth of the big road when I meet 'em."

"Well," said the captain, "what will you do about this preacher?"

"A man in a corner," responded Chadwick, "is obleeged to do the best he kin. I'll jest keep my eye on him, an' the fust motion he makes, I'll—"

"Run?" suggested the captain.

"Well, now," said Chadwick, "a man in a corner can't most ingener'ly run. Git me hemmed in, an' I'll scratch an' bite an' scuffle the best way I know how. It's human natur', an' I'm mighty glad it is; for if that old man's eyes did n't tell no lies we'll have to scratch an' scuffle before we git away from this mountain."

Captain Moseley bit his mustache and smiled grimly as the tired horses toiled up the road. A vague idea of possible danger had crossed his mind while talking to Uncle Billy Powers, but he dismissed it at once as a matter of little importance to a soldier bent on carrying out his orders at all hazards.

It was not long before the two travelers found themselves on a plateau formed by a shoulder of the mountain. On this plateau were abundant signs of life. Cattle were grazing about among the trees, chickens were crowing, and in the distance could be heard the sound of a woman's voice singing. As they pressed forward along the level road they came in sight of a cabin, and the blue smoke curling from its short chimney was suggestive of hospitality. It was a comfortable-looking cabin, too, flanked by several outhouses. The buildings, in contrast with the majestic bulk of the mountain, that still rose precipitously skyward, were curiously small, but there was an air of more than ordinary neatness and coziness about them. And there were touches of feminine hands here and there that made an impression—rows of well-kept boxwood winding like a green serpent through the yard, and a privet hedge that gave promise of rare sweetness in the spring.

As the soldiers approached a dog barked, and then the singing ceased, and the figure of a young girl appeared in the doorway, only to disappear like a flash. This vision, vanishing with incredible swiftness, was succeeded by a more substantial one in the shape of a motherly looking woman, who stood gazing over her spectacles at the horsemen, apparently undecided whether to frown or to smile. The smile would have undoubtedly forced its way to the pleasant face in any event, for the years had fashioned many a pathway for it, but just then Uncle Billy Powers himself pushed the woman aside and made his appearance, laughing.

"Light, boys, 'light!" he exclaimed, walking nimbly to the gate. "'Light whilst I off wi' your creetur's gear. Ah!" he went on, as he busied himself unsaddling the horses, "you thought that while your Uncle Billy was a-moonin' aroun' down the hill yander you'd steal a march on your Aunt Crissy, an' maybe come a-conscriptin' of her into the army. But

not so—not so! Your Uncle Billy has been here long enough to get his hands an' his face rested."

"You must have been in a tremendous hurry," said Captain Moseley, remembering the weary length of mountain road he had climbed.

"Why; I could 'a' tuck a nap an' 'a' beat you," said the old man.

"Two miles of tough road, I should say," responded Moseley.

"Go straight through my hoss lot and let yourself down by a saplin' or two," said Uncle Billy, "an' it ain't more 'n a good quarter." Whereupon the old man laughed heartily.

"Jes leave the creeturs here," he went on. "John Jeems an' Fillmore will ten' to 'em whilst we go in an' see what your Aunt Crissy is gwine to give us for supper. You won't find the grub so mighty various, but there is plenty enough of what they is."

JOHN JEEMS.

There was just enough of deference in Aunt Crissy's greeting to be pleasing, and her unfeigned manifestations of hospitality soon caused the guests to forget that they might possibly be regarded as intruders in that peaceful region. Then there were the two boys, John Jeems and Fillmore, both large enough and old enough, as Captain Moseley quietly observed to himself, to do military service, and both shy and awkward to a degree. And then there was Polly, a young woman grown, whose smiles all ran to blushes and

dimples. Though she was grown, she had the ways of a girl—the vivacity of health and good humor, and the innocent shyness of a child of nature. Impulsive and demure by turns, her moods were whimsical and elusive and altogether delightful. Her beauty, which illumined the old cabin, was heightened by a certain quality that may be described as individuality. Her face and hands were browned by the sun, but in her cheeks the roses of youth and health played constantly. There is nothing more charming to the eye of man than the effects produced when modesty parts company with mere formality and conventionality. Polly, who was as shy as a ground squirrel and as graceful, never pestered herself about formalities. Innocence is not infrequently a very delightful form of boldness. It was so in the case of Polly Powers, at any rate.

The two rough soldiers, unused to the society of women, were far more awkward and constrained than the young woman, but they enjoyed the big fire and the comfortable supper none the less on that account. When, to employ Mrs. Powers's vernacular, "the things were put away," they brought forth their pipes; and they felt so contented that Captain Moseley reproved himself by suggesting that it might be well for them to proceed on their journey up the mountain. But their hosts refused to listen to such a proposal.

"Not so," exclaimed Uncle Billy; "by no means. Why, if you knowed this hill like we all, you 'd hoot at the bar' idee of gwine further after nightfall. Besides," the old man went on, looking keenly at his daughter, "ten to one you won't find Spurlock."

Polly had been playing with her hair, which was caught in a single plait and tied with a bit of scarlet ribbon. When Spurlock's name was mentioned she used the plait as a whip, and struck herself impatiently in the hand with the glossy black thong, and then threw it behind her, where it hung dangling nearly to the floor.

"Now I tell you what, boys," said Uncle Billy, after a little pause; "I 'd jes like to know who is at the bottom of this Spurlock business. You all may have took a notion that he 's a no-count sorter chap—an' he is kinder puny; but what does the army want with a puny man?"

"It 's the law," said Captain Moseley, simply, perceiving that his mission was clearly understood. "He is old enough and strong enough to serve in the army. The law calls for him, and he 'll have to go. The law wants him now worse than ever."

"Yes," said Private Chadwick, gazing into the glowing embers—"lots worse 'n ever."

"What 's the matter along of him now?"

inquired Mrs. Powers, knocking the ashes from her pipe against the chimney jamb.

"He 's a deserter," said Chadwick.

"Tooby shore!" exclaimed Mrs. Powers. "An' what do they do wi' 'em, then?"

For answer Private Chadwick passed his right hand rapidly around his neck, caught hold of an imaginary rope, and looked upwards at the rafters, rolling his eyes and distorting his features as though he were strangling. It was a very effective pantomime. Uncle Billy shook his head and groaned, Aunt Crissy lifted her hands in horror, and then both looked at Polly. That young lady had risen from her chair and made a step towards Chadwick. Her eyes were blazing.

"You 'll be hung long before Israel Spurlock," she cried, her voice thick with anger. Before another word had been said she swept from the room, leaving Chadwick sitting there with his mouth wide open.

"Don't let Polly pester you," said Uncle Billy, smiling a little at Chadwick's discomfiture. "She thinks the world an' all of Sister Spurlock, an' she 's been a-knowin' Israel a mighty long time."

"Yes," said Aunt Crissy, with a sigh; "the poor child is hot-headed an' high-tempered. I reckon we 've sp'ilt 'er. 'T ain't hard to spile a gal when you hain't got but one."

Before Chadwick could make reply a shrill, querulous voice was heard coming from the room into which Polly had gone. The girl had evidently aroused some one who was more than anxious to engage in a war of words.

"Lord A'mighty massy! whar 's any peace?" the shrill voice exclaimed. "What chance on the top side of the yeth is a poor sick creetur got? Oh, what makes you come a-tromplin' on the floor like a drove of wild hosses, an' a-shakin' the clabberds on the roof? I know! I know!"—the voice here almost rose to a shriek,—“it 's 'cause I 'm sick an' weak, an' can't he'p myself. Lord! ef I but had strength!"

At this point Polly's voice broke in, but what she said could only be guessed by the noise in the next room.

"Well, what ef the house an' yard was full of 'em? Who 's afeard? After Spurlock? Who keers? Hain't Spurlock got no friends on Sugar Mountain? Ef they are after Spurlock, ain't Spurlock got as good a right for to be after them? Oh, go 'way! Gals hain't got no sense. Go 'way! Go tell your pappy to come here an' he'p me in my cheer. Oh, go on!"

Polly had no need to go, however. Uncle Billy rose promptly and went into the next room.

"Hit 's daddy," said Aunt Crissy, by way

of explanation. "Lord! daddy used to be a mighty man in his young days, but he 's that wasted wi' the palsy that he hain't more 'n a shadder of what he was. He 's jes like a baby, an' he 's mighty quar'lsome when the win' sets in from the east."

According to all symptoms the wind was at that moment setting terribly from the east. There was a sound of shuffling in the next room, and then Uncle Billy Powers came into the room, bearing in his stalwart arms a big rocking-chair containing a little old man whose body and limbs were shriveled and shrunken. Only his head, which seemed to be abnormally large, had escaped the ravages of whatever disease had seized him. His eyes were bright as a bird's, and his forehead was noble in its proportions.

"Gentlemen," said Uncle Billy, "this here is Colonel Dick Watson. He used to be a big politicianer in his day an' time. He 's my father-in-law."

Uncle Billy seemed to be wonderfully proud of his connection with Colonel Watson. As for the colonel, he eyed the strangers closely, forgetting, apparently, to respond to their salutation.

"I reckon you think it 's mighty fine, thish 'ere business er gwine ter war whar they hain't nobody but peaceable folks," exclaimed the colonel, his shrill, metallic voice being in curious contrast to his emaciated figure.

"Daddy!" said Mrs. Powers in a warning tone.

"Lord A'mighty! don't pester me, Crissy Jane. Hain't I done seed war before? When I was in the legislatur' did n't the boys rig up an' march away to Mexico? But you know yourself," the colonel went on, turning to Uncle Billy's guests, "that this hain't Mexico, an' that they hain't no war gwine on on this 'ere hill. You know that mighty well."

"But there 's a tolerable big one going on over yonder," said Captain Moseley, with a sweep of his hand to the westward.

"Now, you don't say!" exclaimed Colonel Watson, sarcastically. "A big war goin' on an' you all quiled up here before the fire, out 'n sight an' out 'n hearin'! Well, well, well!"

"We are here on business," said Captain Moseley, gently.

"Tooby shore!" said the colonel, with a sinister screech that was intended to simulate laughter. "You took the words out 'n my mouth. I was in-about ready to say it when you upped an' said it yourself. War gwine on over yander an' you all up here on business. Crissy Jane," remarked the colonel in a different tone, "come here an' wipe my face an' see ef I 'm a-sweatin'. Ef I 'm a-sweatin', hit 's the fust time since Sadday before last."

Mrs. Powers mopped her father's face, and assured him that she felt symptoms of perspiration.

"Oh, yes!" continued the colonel. "Business here an' war yander. I hear tell that you er after Israel Spurlock. Lord A'mighty above us! What er you after Israel for? He hain't got no niggers for to fight for. All the fightin' he can do is to fight for his ole mammy."

Captain Moseley endeavored to explain to Colonel Watson why his duty made it imperatively necessary to carry Spurlock back to the conscript camp, but in the midst of it all the old man cried out:

"Oh, I know who sent you!"

"Who?" the captain said.

"Nobody but Wesley Lovejoy!"

Captain Moseley made no response, but gazed into the fire. Chadwick, on the other hand, when Lovejoy's name was mentioned, slapped himself on the leg, and straightened himself up with the air of a man who has made an interesting discovery.

"Come, now," Colonel Watson insisted, "hain't it so? Did n't Wesley Lovejoy send you?"

"Well," said Moseley, "a man named Lovejoy is on Colonel Waring's staff, and he gave me your orders."

At this the old man fairly shrieked with laughter, and so sinister was its emphasis that the two soldiers felt the cold chills creeping up their backs.

"What is the matter with Lovejoy?" It was Chadwick who spoke.

"Oh, wait!" cried Colonel Watson; "thes wait. You may n't want to wait, but you 'll have to. I may look like I 'm mighty puny, an' I speck I am, but I hain't dead yit. Lord A'mighty, no! Not by a long shot!"

There was a pause here, during which Aunt Crissy remarked, in a helpless sort of way:

"I wonder wher' Polly is, an' what she 's a-doin'?"

"Don't pester 'long of Polly," snapped the paralytic. "She knows what she 's a-doin'."

"About this Wesley Lovejoy," said Captain Moseley, turning to the old man: "you seem to know him very well."

"You hear that, William!" exclaimed Colonel Watson. "He asts me ef I know Wes. Lovejoy! Do I know him? Why, the triffin' houn'! I 've knowed him ev'ry sence he was big enough to rob a hen-roos'."

Uncle Billy Powers, in his genial way, tried to change the current of conversation, and he finally succeeded, but it was evident that Adjutant Lovejoy had one enemy, if not several, in that humble household. Such was the feeling for Spurlock and contempt for Wesley Lovejoy that Captain Moseley and Private

Chadwick felt themselves to be interlopers, and they once more suggested the necessity of pursuing their journey. This suggestion seemed to amuse the paralytic, who laughed loudly.

"Lord A'mighty!" he exclaimed, "I know how you feel, an' I don't blame you for feelin' so; but don't you go up the mountain this night. Thes stay right whar you is, beca'se ef you don't you 'll make all your friends feel bad for you. Don't ast me how, don't ast me why. Thes you stay. Come an' put me to bed, William, an' don't let these folks go out 'n the house this night."

Uncle Billy carried the old man into the next room, tucked him away in his bed, and then came back. Conversation lagged to such an extent that Aunt Crissy once more felt moved to inquire about Polly. Uncle Billy responded with a sweeping gesture of his right hand, which might mean much or little. To the two Confederates it meant nothing, but to Aunt Crissy it said that Polly had gone up the mountain in the rain and cold. Involuntarily the woman shuddered and drew nearer the fire.

It was in fact a venturesome journey that Polly had undertaken. Hardened as she was to the weather, familiar as she was with the footpaths that led up and down and around the face of the mountain, her heart rose in her mouth when she heard herself fairly on the way to Israel Spurlock's house. The darkness was almost overwhelming in its intensity. As Uncle Billy Powers remarked, while showing the two Confederates to their bed in the "shed-room," there "was a solid chunk of it from one eend of creation to t' other." The rain, falling steadily but not heavily, was bitterly cold, and it was made more uncomfortable by the wind, which rose and fell with a muffled roar, like the sigh of some Titanic spirit flying hither and yonder in the wild recesses of the sky. Bold as she was, the girl was appalled by the invisible contention that seemed to be going on in the elements above her, and more than once she paused, ready to flee, as best she could, back to the light and warmth she had left behind; but the gesture of Chadwick, with its cruel significance, would recur to her, and then, clenching her teeth, she would press blindly on. She was carrying a message of life and freedom to Israel Spurlock.

With the rain dripping from her hair and her skirts, her face and hands benumbed with cold, but with every nerve strung to the highest tension and every faculty alert to meet whatever danger might present itself, Polly struggled up the mountain path, feeling her way as best she could, and pulling herself along by the aid of the friendly saplings and the overhanging trees.

After a while—and it seemed a long while to Polly, contending with the fierce forces of the night and beset by a thousand doubts and fears—she could hear Spurlock's dogs barking. What if the two soldiers, suspecting her mission, had mounted their horses and outstripped her? She had no time to remember the difficulties of the mountain road, nor did she know that she had been on her journey not more than half an hour. She was too excited either to reason or to calculate. Gathering her skirts in her hands as she rose to the level of the clearing, Polly rushed across it towards the little cabin, tore open the frail little gate, and flung herself against the door with a force that shook the house.

Old Mrs. Spurlock was spinning, while Israel carded the rolls for her. The noise that Polly made against the door startled them both. The thread broke in Mrs. Spurlock's hand, and one part of it curled itself on the end of the broach with a buzz that whirled it into a fantastically tangled mass. The cards dropped from Israel's hands with a clatter that added to his mother's excitement.

"Did anybody ever hear the beat of that?" she exclaimed. "Run, Iserl, an' see what it is that 's a-tryin' to tear the roof off 'n the house."

Israel did not need to be told, nor did Mrs. Spurlock wait for him to go. They reached the door together, and when Israel threw it open they saw Polly Powers standing there, pale, trembling, and dripping.

"Polly!" cried Israel, taking her by the arm. He could say no more.

"In the name er the Lord!" exclaimed Mrs. Spurlock, "wher' 'd you drop from? You look more like a drowned ghost than you does like folks. Come right in here an' dry yourse'f. What in the name of mercy brung you out in sech weather? Who 's dead or a-dyin'? Why, look at the gal!" Mrs. Spurlock went on in a louder tone, seeing that Polly stood staring at them with wide-open eyes, her face as pale as death.

"Have they come?" gasped Polly.

"Listen at 'er, Iserl! I b'lieve in my soul she 's done gone an' run ravin' deestracted. Shake 'er, Iserl; shake 'er."

For answer Polly dropped forward into Mrs. Spurlock's arms, all wet as she was, and there fell to crying in a way that was quite alarming to Israel, who was not familiar with feminine peculiarities. Mrs. Spurlock soothed Polly as she would have soothed a baby, and half carried half led her to the fireplace. Israel, who was standing around embarrassed and perplexed, was driven out of the room, and soon Polly was decked out in dry clothes. These "duds," as Mrs. Spurlock called them, were ill-fitting and ungraceful, but in Israel's eyes

the girl was just as beautiful as ever. She was even more beautiful when, fully recovered from her excitement, she told with sparkling eyes and heightened color the story she had to tell.

Mrs. Spurlock listened with the keenest interest, and with many an exclamation of indignation, while Israel heard it with undisguised admiration for the girl. He seemed to enjoy the whole proceeding, and when Polly in the ardor and excitement of her narration betrayed an almost passionate interest in his probable fate, he rubbed his hands slowly together and laughed softly to himself.

MRS. SPURLOCK.

"An' jest to think," exclaimed Polly, when she had finished her story, "that that there good for nothin' Wesley Lovejoy had the impudence to ast me to have him no longer 'n last year, an' he 's been a-flyin' round me constant."

"I seed him a-droppin' his wing," said Israel, laughing. "I reckon that 's the reason he 's after me so hot. But never you mind, mammy; you thes look after the gal that 's gwine to be your daughter-in-law, an' I 'll look after your son."

"Go off, you goose!" cried Polly, blushing and smiling. "Ef they hang you, whose daughter-in-law will I be then?"

"The Lord knows!" exclaimed Israel, with mock seriousness. "They tell me that Lovejoy is an orphan!"

"You must be crazy," cried Polly, indignantly. "I hope you don't think I 'd marry

that creetur. I would n't look at him if he was the last man. You better be thinkin' about your goozle."

"It 's ketchin' befo' hangin'," said Israel.

"They 've mighty nigh got you now," said Polly. Just then a hickory nut dropped on the roof of the house, and the noise caused the girl to start up with an exclamation of terror.

"You thought they had me then," said Israel, as he rose and stood before the fire, rubbing his hands together, and seeming to enjoy most keenly the warm interest the girl manifested in his welfare.

"Oh, I wisht you 'd cut an' run," pleaded Polly, covering her face with her hands; "they 'll be here therreckly."

Israel was not a bad-looking fellow as he stood before the fire laughing. He was a very agreeable variation of the mountain type. He was angular, but neither stoop-shouldered nor cadaverous. He was awkward in his manners, but very gracefully fashioned. In point of fact, as Mrs. Powers often remarked, Israel was "not to be sneezed at."

After a while he became thoughtful. "I jest tell you what," he said, kicking the chunks vigorously, and sending little sparks of fire skipping and cracking about the room. "This business puzzles me — I jest tell you it does. That Wes. Lovejoy done like he was the best friend I had. He was constantly huntin' me up in camp, an' when I told him I would like to come home an' git mammy's crap in, he jest laughed an' said he did n't reckon I 'd be missed much, an' now he 's a-houndin' me down. What has the man got agin me?"

Polly knew, but she did n't say. Mrs. Spurlock suspected, but she made no effort to enlighten Israel. Polly knew that Lovejoy was animated by blind jealousy, and her instinct taught her that a jealous man is usually a dangerous one. Taking advantage of one of the privileges of her sex, she had at one time carried on a tremendous flirtation with Lovejoy. She had intended to amuse herself simply, but she had kindled fires she was powerless to quench. Lovejoy had taken her seriously, and she knew well enough that he regarded Israel Spurlock as a rival. She had reason to suspect, too, that Lovejoy had pointed out Israel to the conscript officers, and that the same influence was controlling and directing the pursuit now going on.

Under the circumstances, her concern — her alarm, indeed — was natural. She and Israel had been sweethearts for years, — real sure-enough sweethearts, as she expressed it to her grandfather, — and they were to be married in a short while; just as soon, in fact, as the necessary preliminaries of clothes-making

and cake-baking could be disposed of. She thought nothing of her feat of climbing the mountain in the bitter cold and the overwhelming rain. She would have taken much larger risks than that; she would have faced any danger her mind could conceive of. And Israel appreciated it all; nay, he fairly gloated over it. He stood before the fire fairly hugging the fact to his bosom. His face glowed, and his whole attitude was one of exultation; and with it, shaping every gesture and movement, was a manifestation of fearlessness which was all the more impressive because it was unconscious.

This had a tendency to fret Polly, whose alarm for Israel's safety was genuine.

"Oh, I do wisht you 'd go on," she cried; "them men 'll shorely ketch you ef you keep on a-stayin' here a-winkin' an' a-gwine on makin' monkey motions."

"Shoo!" exclaimed Israel. "Ef the house was surrounded for forty thousan' of 'em, I 'd git by 'em, an', ef need be, take you wi' me."

While they were talking the dogs began to bark. At the first sound Polly rose from her chair with her arms outstretched, but fell back pale and trembling. Israel had disappeared as if by magic, and Mrs. Spurlock was calmly lighting her pipe by filling it with hot embers. It was evidently a false alarm, for, after a while, Israel backed into the door and closed it again with comical alacrity.

"Sh-sh-sh!" he whispered, with a warning gesture, seeing that Polly was about to protest. "Don't make no fuss. The dogs has been a-barkin' at sperits an' things. Jest keep right still."

He went noiselessly about the room, picking up first one thing and then another. Over one shoulder he flung a canteen and over the other a hunting-horn. Into his coat pocket he thrust an old-fashioned powder flask. Meanwhile his mother was busy gathering together such articles as Israel might need. His rifle she placed by the door, and then filled a large homespun satchel with a supply of victuals — a baked fowl, a piece of smoked beef, and a big piece of light bread. These preparations were swiftly and silently made. When everything seemed to be ready for his departure Israel presented the appearance of a peddler.

"I 'm goin' up to the Rock," he said, by way of explanation, "an' light the fire. Maybe the boys 'll see it, an' maybe they won't. Leastways they 're mighty apt to smell the smoke."

Then, without further farewell, he closed the door and stepped out into the darkness, leaving the two women sitting by the hearth. They sat there for hours, gazing into the fire

and scarcely speaking to each other. The curious reticence that seems to be developed and assiduously cultivated by the dwellers on the mountains took possession of them. The confidences and the sympathies they had in common were those of observation and experience, rather than the result of an interchange of views and opinions.

Towards morning the drizzling rain ceased, and the wind, changing its direction, sent the clouds flying to the east, whence they had come. About dawn, Private Chadwick, who had slept most soundly, was aroused by the barking of the dogs, and got up to look after the horses. As he slipped quietly out of the house he saw a muffled figure crossing the yard.

"Halt!" he cried, giving the challenge of a sentinel. "Who goes there?"

"Nobody, ner nothin' that 'll bite you, I reckon," was the somewhat snappish response. It was the voice of Polly. She was looking up and across the mountains to where a bright red glare was reflected on the scurrying clouds. The density of the atmosphere was such that the movements of the flames were photographed on the clouds, rising and falling, flaring and fading, as though the dread spirits of the storm were waving their terrible red banners from the mountain.

"What can that be?" asked Chadwick, after he had watched the singular spectacle a moment.

Polly laughed aloud, almost joyously. She knew it was Israel's beacon. She knew that these red reflections, waving over the farther spur of the mountain and over the valley that nestled so peacefully below, would summon half a hundred men and boys—the entire congregation of Antioch Church, where her father was in the habit of holding forth on the first Sunday of each month. She knew that Israel was safe, and the knowledge restored her good humor.

"What did you say it was?" Chadwick inquired again, his curiosity insisting on an explanation.

"It's jest a fire, I reckon," Polly calmly replied. "Ef it's a house burnin' down, it can't be help. Water could n't save it now."

Whereupon she pulled the shawl from over her head, tripped into the house, and went about preparing breakfast, singing merrily. Chadwick watched her as she passed and repassed from the rickety kitchen to the house, and when the light grew clearer he thought he saw on her face a look that he did not understand. It was indeed an inscrutable expression, and it would have puzzled a wiser man than Chadwick. He chopped some wood, brought some water, and made himself generally useful; but he received no thanks from Polly.

She ignored him as completely as if he had never existed, and all this set the private to thinking. Now a man who reflects much usually thinks out a theory to fit everything that he fails to understand. Chadwick thought out his theory while the girl was preparing breakfast.

It was not long before the two soldiers were on their way up the mountain, nor was it long before Chadwick began to unfold his theory, and in doing so he managed to straighten it by putting together various little facts that occurred to him as he talked.

"I tell you what, Captain," he said, as soon as they were out of hearing; "that gal's a slick 'un. It's my belief that we are gwine on a fool's errand. 'Stead of gwine towards Spurlock, we're gwine right straight away from 'im. When that gal made her disappearance last night she went an' found Spurlock, an' ef he ain't a natchul born fool he tuck to the woods. Why, the shawl the gal had on her head this mornin' was soakin' wet. It were n't rainin', an' had n't been for a right smart while. How come the shawl wet? They were n't but one way. It got wet by rubbin' agin the bushes an' the limbs er the trees."

This theory was plausible enough to impress itself on Captain Moseley. "What is to be done, then?" he asked.

"Well, the Lord knows what ought to be done," said Chadwick; "but I reckon the best plan is to sorter scatter out an' skirmish aroun' a little bit. We'd better divide our army. You go up the mountain an' git Spurlock, if he's up thar, an' let me take my stan' on the ridge yander an' keep my eye on Uncle Billy's back yard an' hoss lot. If Spurlock is r'ally tuck to the woods, he'll be mighty apt to be slinkin' 'roun' whar the gal is."

Captain Moseley assented to this plan, and proceeded to put it in execution as soon as he and Chadwick were a safe distance from Uncle Billy Powers's house. Chadwick, dismounting, led his horse along a cow-path that ran at right angles to the main road, and was soon lost to sight, while the captain rode forward on his mission.

Of the two, as it turned out, the captain had much the more comfortable experience. He reached the Spurlock house in the course of three-quarters of an hour.

In response to his halloo Mrs. Spurlock came to the door.

"I was a-spinnin' away for dear life," she remarked, brushing her gray hair from her face, "when all of a sudden I hearn a fuss, an' I 'lows ter myself, says I, 'I'll be boun' that's some one a-hailin',' says I; an' then I dropped ever'thin' an' run ter the door, an' shore enough it was. Won't you 'light an' come

in?" she inquired with ready hospitality. Her tone was polite, almost obsequious.

"Is Mr. Israel Spurlock at home?" the captain asked.

"Not, as you might say, adzackly at home, but I reckon in reason it won't be long before he draps in. He hain't had his breakfas' yit, though hit 's been a-waitin' for him tell hit 's stone col'. The cows broke out last night, an' he went off a-huntin' of 'em time it was light good. Iserl is thes ez rank after his milk ez some folks is after the'r dram. I says, says I, 'Shorely you kin do 'thout your milk one mornin' in the year'; but he would n't nigh hear ter that. He thes up an' bolted off."

"I 'll ride on," said the captain. "Maybe I 'll meet him coming back. Good-by."

It was an uneventful ride, but Captain Moseley noted one curious fact. He had not proceeded far when he met two men riding down the mountain. Each carried a rifle flung across his saddle in front of him. They responded gravely to the captain's salutation.

"Have you seen Israel Spurlock this mornin'?" he asked.

"No, sir, I hain't saw him," answered one. The other shook his head. Then they rode on down the mountain.

A little farther on Captain Moseley met four men. These were walking, but each was armed—three with rifles, and one with a shot-gun. They had not seen Spurlock. At intervals he met more than a dozen—some riding and some walking, but all armed. At last he met two that presented something of a contrast to the others. They were armed, it is true; but they were laughing and singing as they went along the road, and while they had not seen Spurlock with their own eyes, as they said, they knew he must be farther up the mountain, for they had heard of him as they came along.

Riding and winding around upward, Captain Moseley presently saw a queer-looking little chap coming towards him. The little man had a gray beard, and as he walked he had a movement like a camel. Like a camel, too, he had a great hump on his back. His legs were as long as any man's, but his whole body seemed to be contracted in his hump. He was very spry, too, moving along as active as a boy, and there was an elfish expression on his face such as one sees in old picture-books—a cunning, leering expression, which yet had for its basis the element of humor. The little man carried a rifle longer than himself, which he flourished about with surprising ease and dexterity—practising apparently some new and peculiar manual.

"Have you seen Israel Spurlock?" inquired Captain Moseley, reining in his horse.

"Yes! Oh, yes! Goodness gracious, yes!" replied the little man, grinning good-naturedly.

"Where is he now?" asked the captain.

"All about. Yes! All around! Gracious, yes!" responded the little man, with a sweeping gesture that took in the whole mountain. Then he seemed to be searching eagerly in the road for something. Suddenly pausing, he exclaimed: "Here 's his track right now! Oh, yes! Right fresh, too! Goodness, yes!"

"Where are you going?" Moseley asked, smiling at the antics of the little man, their nimbleness being out of all proportion to his deformity.

For answer the little man whirled his rifle over his hump and under his arm, and caught it as it went flying into the air. Then he held it at a "ready," imitating the noise of the lock with his mouth, took aim and made believe to fire, all with indescribable swiftness and precision. Captain Moseley rode on his way laughing; but, laugh as he would, he could not put out of his mind the queer impression the little man had made on him, nor could he rid himself of a feeling of uneasiness. Taking little notice of the landmarks that ordinarily attract the notice of the traveler in a strange country, he suddenly found himself riding along a level stretch of tableland. The transformation was complete. The country roads seemed to cross and recross here, coming and going in every direction. He rode by a little house that stood alone in the level wood, and he rightly judged it to be a church. He drew rein and looked around him. Everything was unfamiliar. In the direction from which he supposed he had come a precipice rose sheer from the tableland more than three hundred feet. At that moment he heard a shout, and looking up he beheld the hunchback flourishing his long rifle and cutting his queer capers.

The situation was so puzzling that Captain Moseley passed his hand over his eyes, as if to brush away a scene that confused his mind and obstructed his vision. He turned his horse and rode back the way he had come, but the way seemed to be so unfamiliar that he turned into another road, and in the course of a quarter of an hour he was compelled to acknowledge that he was lost. Everything appeared to be turned around, even the little church.

Meanwhile Private Chadwick was having an experience of his own. In parting from Captain Moseley he led his horse through the bushes, following for some distance a cow-path. This semblance of a trail terminated in a "blind path," and this Chadwick followed as best he could, picking his way cautiously and choosing ground over which his horse could follow. He had to be very careful. There were no

leaves on the trees, and the undergrowth was hardly thick enough to conceal him from the keen eyes of the mountaineers. Finally he tied his horse in a thicket of black-jacks, where he had the whole of Uncle Billy Powers's little farm under his eye. His position was not an uncomfortable one. Sheltered from the wind, he had nothing to do but sit on a huge chestnut log and ruminate, and make a note of the comings and goings on Uncle Billy's premises.

Sitting thus, Chadwick fell to thinking; thinking, he fell into a doze. He caught himself nodding more than once, and upbraided himself bitterly. Still he nodded—he, a soldier on duty at his post. How long he slept he could not tell, but he suddenly awoke to find himself dragged backward from the log by strong hands. He would have made some resistance, for he was a fearless man at heart and a tough one to handle in a knock-down and drag-out tussle; but resistance was useless. He had been taken at a disadvantage, and before he could make a serious effort in his own behalf he was lying flat on his back with his hands tied and as helpless as an infant. He looked up and discovered that his captor was Israel Spurlock.

"Well, blame my scaly hide!" exclaimed Chadwick, making an involuntary effort to free his hands. "You 're the identical man I 'm a-huntin'."

"An' now you 're sorry you went an' foun' me, I reckon," said Israel.

"Well, I ain't as glad as I 'lowed I 'd be," said Chadwick. "Yit nuther am I so mighty sorry. One way or 'nother I knowed in reason I 'd run up on you."

"You 're mighty right," responded Israel, smiling not ill-naturedly. "You fell in my arms same as a gal in a honeymoon. Lemme lift you up, as the mule said when he kicked the nigger over the fence. Maybe you 'll look purtier when you swap een's." Thereupon Israel helped Chadwick to his feet.

"You ketched me that time, certain and shore," said the latter, looking at Spurlock and laughing; "they ain't no two ways about that. I was a-settin' on the log thar a-noddin' an' a-dreamin' 'bout Christmas. 'T ain't many days off, I reckon."

"Oh, yes!" exclaimed Spurlock, sarcastically; "a mighty purty dream, I bet a hoss. You was fixin' up for to cram me in Lovejoy's stockin'. A mighty nice present I 'd 'a' been, tooby shore. Stidder hangin' up his stockin', Lovejoy was a-aimin' for to hang me up. Oh, yes! Christmas dreams is so mighty nice an' fine, I 'm a great min' to set right down here an' have one er my own—one of them kin' er dreams what 's got a forked tail an' fire-works mixed up on it."

"Well," said Chadwick, with some seriousness, "whose stockin' is you a-gwine to cram me in?"

"In whose else's but Danny Lemmons's? An' won't he holler an' take on? Why, I would n't miss seein' Danny Lemmons take on for a hat full er shimplasters. Dang my buttons ef I would!"

Chadwick looked at his captor with some curiosity. There was not a trace of ill-feeling or bad humor in Spurlock's tone, nor in his attitude. The situation was so queer that it was comical, and Chadwick laughed aloud as he thought about it. In this Spurlock heartily joined him, and the situation would have seemed doubly queer to a passer-by chancing along and observing captor and prisoner laughing and chatting so amiably together.

"Who, in the name of goodness, is Danny Lemmons?"

"Lord!" exclaimed Spurlock, lifting both hands, "don't ast me about Danny Lemmons. He 's—he 's—well, I tell you what, he 's the bull er the woods, Danny Lemmons is; nuther more ner less. He hain't bigger 'n my two fists, an' he 's 'flicted, an' he 's all crippled up in his back, whar he had it broke when he was a baby, an' yit he 's in-about the pearrest man on the mountain, an' he 's the toughest an' the sooplest. An' more 'n that, he 's got them things up here," Spurlock went on, tapping his head significantly. Chadwick understood this to mean that Lemmons, whatever might be his afflictions, had brains enough and to spare.

There was a pause in the conversation, and then Chadwick, looking at his bound wrists, which were beginning to chafe and swell, spoke up.

"What 's your will wi' me?" he asked.

"Well," said Spurlock, rising to his feet, "I 'm a-gwine to empty your gun, an' tote your pistol for you, an' invite you down to Uncle Billy's. Oh, you need n't worry," he went on, observing Chadwick's disturbed expression; "they 're expectin' of you. Polly 's tol' 'em you 'd likely come back."

"How did Polly know?" Chadwick inquired.

"Danny Lemmons tol' 'er."

"By George!" exclaimed Chadwick, "the woods is full of Danny Lemmons."

"Why, bless your heart," said Spurlock, "he thes swarms roun' here."

After Spurlock had taken the precaution to possess himself of Chadwick's arms and ammunition he cut the cords that bound his prisoner's hands, and the two went down the mountain, chatting as pleasantly and as sociably as two boon companions. Chadwick found no lack of hospitality at Uncle Billy

Powers's house. His return was taken as a matter of course, and he was made welcome. Nevertheless, his entertainers betrayed a spirit of levity that might have irritated a person less self-contained.

"I see he 's ketched you, Iserl," remarked Uncle Billy with a twinkle in his eye. "He 'lowed las' night as how he 'd fetch you back wi' him."

"Yes," said Israel, "he thes crope up on me. It 's mighty hard for to fool these army fellers."

Then and afterward the whole family pretended to regard Spurlock as Chadwick's prisoner. This was not a joke for the latter to relish, but it was evidently not intended to be offensive, and he could do no less than humor it. He accepted the situation philosophically. He even prepared himself to relish Captain Moseley's astonishment when he returned and discovered the true state of affairs. As the day wore away it occurred to Chadwick that the captain was in no hurry to return. Even Uncle Billy Powers grew uneasy.

"Now, I do hope an' trust he ain't gone an' lost his temper up thar in the woods," remarked Uncle Billy. "I hope it from the bottom of my heart. These here wars an' rumors of wars makes the folks mighty restless. They 'll take resks now what they would n't dasset to of tuck before this here rippit begun, an' it 's done got so now human life ain't wuth shucks. The boys up here ain't no better 'n the rest. They fly to piecés quicker 'n they ever did."

No trouble, however, had come to Captain Moseley. Though he was confused in his bearings, he was as serene and as unruffled as when training a company of raw conscripts in the art of war. After an unsuccessful attempt to find the road he gave his horse the rein, and that sensible animal, his instinct sharpened by remembrance of Uncle Billy Powers's corn-crib and fodder, moved about at random until he found that he was really at liberty to go where he pleased, and then he turned short about, struck a little canter, and was soon going down the road by which he had come. The captain was as proud of this feat as if it were due to his own intelligence, and he patted the horse's neck in an approving way.

As Captain Moseley rode down the mountain, reflecting, it occurred to him that his expedition was taking a comical shape. He had gone marching up the hill, and now he came marching down again, and Israel Spurlock, so far as the captain knew, was as far from being a captive as ever—perhaps farther. Thinking it all over in a somewhat irritated frame of mind, Moseley remembered

Lovejoy's eagerness to recapture Spurlock. He remembered, also, what he had heard the night before, and it was in no pleasant mood that he thought it all over. It was such an insignificant, such a despicable affair, two men carrying out the jealous whim of a little militia politician.

"It is enough, by George!" exclaimed Captain Moseley aloud, "to make a sensible man sick."

"Lord, yes!" cried out a voice behind him. Looking around, he saw the hunchback following him. "That 's what I tell 'em; goodness, yes!"

"Now, look here!" said Captain Moseley, reining in his horse, and speaking somewhat sharply. "Are you following me, or am I following you? I don't want to be dogged after in the bushes, much less in the big road."

"Ner me nuther," said the hunchback, in the cheerfulest manner. "An' then thar 's Spurlock—Lord, yes; I hain't axt him about it, but I bet a hoss he don't like to be dogged atter nuther."

"My friend," said Captain Moseley, "you seem to have a quick tongue. What is your name?"

"Danny Lemmons," said the other. "Now don't say I look like I ought to be squeeze. Ever'budy inginer'llly says that," he went on with a grimace, "but I 've squeeze lots more than what 's ever squeeze me. Lord, yes! Yes, sreee! men an' gals tergether. You ax 'em, an' they 'll tell you."

"Lemmons," said the captain, repeating the name slowly. "Well, you look it!"

"Boo!" cried Danny Lemmons, making a horrible grimace; "you don't know what you 're a-talkin' about. The gals all 'low I 'm mighty sweet. You ought to see me when I 'm rigged out in my Sunday-go-to-meetin' duds. Polly Powers she 'lows I look snatchin'. Lord, yes! Yes, sreee! I 'm gwine down to Polly's house now."

Whereat he broke out singing, paraphrasing an old negro ditty, and capering about in the woods like mad.

Oh, I went down to Polly's house,

An' she was not at home;

I set myself in the big arm-cheer

An' beat on the ol' jaw-bone.

Oh, rise up, Polly! Slap 'im on the jaw,

An hit 'im in the eyeball—bim!

The song finished, Danny Lemmons walked on down the road ahead of the horse in the most unconcerned manner. It was part of Captain Moseley's plan to stop at Mrs. Spurlock's and inquire for Israel. This seemed to be a part of Danny's plan also, for he turned out of the main road and went ahead, followed

by the captain. There were quite a number of men at Mrs. Spurlock's when Moseley rode up, and he noticed that all were armed. Some were standing listlessly about, leaning against the trees, some were sitting in various postures, and others were squatting around whittling; but all had their guns within easy reach. Mrs. Spurlock was walking about among them smoking her pipe. By the strained and awkward manner of the men as they returned his salutation, or by some subtle instinct he could not explain, Captain Moseley knew that these men were waiting for him, and that he was their prisoner. The very atmosphere seemed to proclaim the fact. Under his very eyes Danny Lemmons changed from a grinning buffoon into a quiet, self-contained man trained to the habit of command. Recognizing the situation, the old soldier made the most of it by retaining his good humor.

"Well, boys," he said, flinging a leg over the pommel of his saddle, "I hope you are not tired waiting for me." The men exchanged glances in a curious, shame-faced sort of way.

"No," said one; "we was thes a-settin' here talkin' 'bout ol' times. We 'lowed maybe you 'd sorter git tangled up on the hill thar, and so Danny Lemmons, he harked back for to keep a' eye on you."

There was no disposition on the part of this quiet group of men to be clamorous or boastful. There was a certain shyness in their attitude, as of men willing to apologize for what might seem to be unnecessary rudeness.

"I 'll tell you what," said Danny Lemmons, "they ain't a man on the mounting that 's got a blessed thing agin you, ner agin the tother feller, an' they hain't a man anywheres aroun' here that 's a-gwine to pester you. We never brung you whar you is; but now that you 're here we 're a-gwine to whirl in an' ast you to stay over an' take Christmas wi' us, sech ez we 'll have. Lord, yes! a nice time we 'll have, ef I ain't forgot how to finger the fiddle-strings. We 're sorter in a quanderry," Danny Lemmons continued, observing Captain Moseley toying nervously with the handle of his pistol. "We don't know whether you 're a-gwine to be worried enough to start a row, or whether you 're a-gwine to work up trouble."

Meanwhile Danny had brought his long rifle into a position where it could be used promptly and effectually. For answer Moseley dismounted from his horse, unbuckled his belt and flung it across his saddle, and prepared to light his pipe.

"Now, then," said Danny Lemmons, "thes make yourself at home."

Nothing could have been friendlier than the attitude of the mountain men, nor freer than their talk. Captain Moseley learned that

Danny Lemmons was acting under the orders of Colonel Dick Watson, the virile paralytic; that he and Chadwick were to be held prisoners in the hope that Adjutant Lovejoy would come in search of them—in which event there would be developments of a most interesting character.

So Danny Lemmons said, and so it turned out; for one day while Moseley and Chadwick were sitting on the sunny side of Uncle Billy's house, listening to the shrill, snarling tones of Colonel Watson, they heard a shout from the roadside, and behold, there was Danny Lemmons and his little band escorting Lovejoy and a small squad of forlorn-looking militia. Lovejoy was securely bound to his horse, and it may well be supposed that he did not cut an imposing figure. Yet he was undaunted. He was captured, but not conquered. His eyes never lost their boldness, nor his tongue its bitterness. He was almost a match for Colonel Watson, who raved at all things through the tremulous and vindictive lips of disease. The colonel's temper was fitful, but Lovejoy's seemed to burn steadily. Moved by contempt rather than caution, he was economical of his words, listening to the shrill invective of the colonel patiently, but with a curious flicker of his thin lips that caused Danny Lemmons to study him intently. It was Danny who discovered that Lovejoy's eyes never wandered in Polly's direction, nor settled on her, nor seemed to perceive that she was in existence, though she was flitting about constantly on the aimless little errands that keep a conscientious housekeeper busy.

Lovejoy was captured one morning and Christmas fell the next, and it was a memorable Christmas to all concerned. After breakfast Uncle Billy Powers produced his Bible and preached a little sermon—a sermon that was not the less meaty and sincere, not the less wise and powerful, because the English was ungrammatical and the rhetoric uncouth. After it was over the old man cleared his throat and remarked:

"Brethren, we 're gethered here for to praise the Lord an' do his will. The quare times that 's come on us has brung us face to face with much that is unseemly in life, an' likely to fret the sperit an' vex the understandin'. Yit the Almighty is with us, an' of us, an' among us; an', in accordance wi' the commands delivered in this Book, we 're here to fortify two souls in the'r choice, an' to b'ar testimony to the Word that makes lawful marriage a sacrament."

With that, Uncle Billy, fumbling in his coat pockets, produced a marriage license, called Israel Spurlock and his daughter before him, and in simple fashion pronounced the words that made them man and wife.

The dinner that followed hard on the wedding was to the soldiers, who had been subsisting on the tough rations furnished by the Confederate commissaries, by all odds the chief event of the day. To them the resources of the Powers household were wonderful indeed. The shed-room, running the whole length of the house and kitchen, was utilized, and the dinner table, which was much too small to accommodate the guests, invited and uninvited, was supplemented by the inventive genius of Private William Chadwick, who, in the most unassuming manner, had taken control of the whole affair. He proved himself to be an invaluable aid, and his good humor gave a lightness and a zest to the occasion that would otherwise have been sadly lacking.

Under his direction the tables were arranged and the dinner set, and when the politely impatient company were summoned they found awaiting them a meal substantial enough to remind them of the old days of peace and prosperity. It was a genuine Christmas dinner. In the center of the table was a large bowl of egg-nog, and this was flanked and surrounded by a huge dish full of apple dumplings, a tremendous chicken pie, barbecued shote, barbecued mutton, a fat turkey, and all the various accompaniments of a country feast.

When Uncle Billy Powers had said an earnest and simple grace he gave his place at the head of the table to Colonel Watson, who had been brought in on his chair. Aunt Crissy gave Chadwick the seat of honor at the foot, and then the two old people announced that they were ready to wait on the company, with Mr. Chadwick to do the carving. If the private betrayed any embarrassment at all, he soon recovered from it.

"It ain't any use," he said, glancing down the table, "to call the roll. We 're all here an' accounted for. The only man or woman that can't answer to their name is Danny Lemmons's little brown fiddle, an' I 'll bet a sev'm-punce it 'd skreak a little ef he tuck it out 'n the bag. But before we whirl in an' make a charge three deep, le' 's begin right. This is Christmas, and that bowl yander, with the egg-nog in it, looks tired. Good as the dinner is, it 's got to have a file leader. We 'll start in with what looks the nighest like Christmas."

"Well," said Aunt Crissy, "I 've been in sech a swivet all day I don't reelly reckon the nog is wuth your while, but you 'll ha' ter take it thes like you fin' it. Hit 's sweetened wi' long sweet'nin', an' it 'll ha' ter be dipped up wi' a gourd an' drunk out 'n cups."

"Lord bless you, ma'am," exclaimed Chadwick, "they won't be no questions axed ef it 's

got Christmas enough in it, an' I reckon it is, 'ca'se I poured it in myself, an' I can hol' up a jug as long as the nex' man."

Though it was sweetened with syrup, the egg-nog was a success, for its strength could not be denied.

"Ef I had n't 'a' been a prisoner of war, as you may say," remarked Chadwick, when the guests had fairly begun to discuss the dinner, "I 'd 'a' got me a hunk of barbecue an' a dumplin' or two, an' a slice of that chicken pie there—I 'd 'a' grabbed 'em up an' 'a' made off down the mountain. Why, I 'll tell you what 's the truth—I got a whiff of that barbecue by daylight, an', gentulmen, it fairly made me dribble at the mouth. Nex' to Uncle Billy there, I was the fust man at the pit."

"Yes, yes," said Uncle Billy, laughing, "that 's so. An' you holp me a right smart. I 'll say that."

"An' Spurlock, he got a whiff of it. Did n't you all notice, about the time he was gittin' married, how his mouth puckered up? Along towards the fust I thought he was fixin' to dip down an' give the bride a smack. But, bless you, he had barbecue on his min', an' the bride missed the buss."

"He did n't dare to buss me," exclaimed Polly, who was ministering to her grandfather. "Leastways not right out there before you-all."

"Please, ma'am, don't you be skeered of Is-erl," said Chadwick. "I kin take a quarter of that shote an' tole him plumb back to camp."

"Now I don't like the looks er this," exclaimed Uncle Billy Powers, who had suddenly discovered that Lovejoy, sitting by the side of Danny Lemmons, was bound so that it was impossible for him to eat in any comfort. "Come, boys, this won't do. I don't want to remember the time when any livin' human bein' sot at my table on Christmas Day with his han's tied. Come, now!"

"Why, tooby shore!" exclaimed Aunt Crissy. "Turn the poor creetur loose."

"Try it!" cried Colonel Watson, in his shrill voice. "Jest try it!"

"Lord, no!" said Danny Lemmons. "Look at his eyes! Look at 'em."

Lovejoy sat pale and unabashed, his eyes glittering like those of a snake. He had refused all offers of food, and seemed to be giving all his attention to Israel Spurlock.

"What does Moseley say?" asked Colonel Watson.

"Ah, he is your prisoner," said Moseley. "He never struck me as a dangerous man."

"Well," said Chadwick, "ef there 's any doubt, jest take 'im out in the yard an' give 'im han'-roomance. Don't let 'im turn this table over, 'cause it 'll be a long time before

some of this company 'll see the likes of it ag'in."

It was clear that Lovejoy had no friends, even among his comrades. It was clear, too, that this fact gave him no concern. He undoubtedly had more courage than his position seemed to demand. He sat glaring at Spurlock, and said never a word. Uncle Billy Powers looked at him, and gave a sigh that ended in a groan.

"Well, boys," said the old man, "this is my house, an' he's at my table. I reckon we better ontie 'im, an' let 'im git a mou'ful ter eat. 'T ain't nothin' but Christian-like."

"Don't you reckon he 'd better eat at the second table?" inquired Chadwick. This naive suggestion provoked laughter and restored good humor, and Colonel Watson consented that Lovejoy should be released. Danny Lemmons undertook this gracious task. He had released Lovejoy's right arm, and was releasing the left, having to use his teeth on one of the knots, when the prisoner seized a fork—a large horn-handle affair, with prongs an inch and a half long—and, as quick as a flash of lightning, brought it down on Danny Lemmons's back. To those who happened to be looking it seemed that the fork had been plunged into the very vitals of the hunchback.

The latter went down, dragging Lovejoy after him. There was a short, sharp struggle, a heavy thump or two, and then, before the company realized what had happened, Danny Lemmons rose to his feet laughing, leaving Lovejoy lying on the floor, more securely bound than ever.

"I reckon this fork 'll have to be washed," said Danny, lifting the formidable-looking weapon from the floor.

There was more excitement after the struggle was over than there had been or could have been while it was going on. Chadwick insisted on examining Danny Lemmons's back.

"I've saw folks cut an' slashed an' stobbed before now," he explained, "an' they did n't know they was hurt tell they had done cooled off. They ain't no holes here an' they ain't no blood, but I could 'most take a right pine-blank oath that I seed 'im job that fork in your back."

"Tut, tut!" said Colonel Watson. "Do you s'pose I raised Danny Lemmons for the like of that?"

"Well," said Chadwick, resuming his seat and his dinner with unruffled nerves, temper, and appetite, "it beats the known worl'. It's the fust time I ever seed a man git down on

the floor for to give the in-turn an' the under-cut, an' cut the pigeon-wing an' the double-shuffle, all before a cat could bat her eye. It looks to me that as peart a man as Lemmons there ought to be in the war."

"Ain't he in the war?" cried Colonel Watson, excitedly. "Ain't he forever and eternally in the war? Ain't he my bully bushwhacker?"

"On what side?" inquired Chadwick.

"The Union, the Union!" exclaimed the colonel, his voice rising into a scream.

"Well," said Chadwick, "ef you think you kin take the taste out 'n this barbecue with talk like that, you are mighty much mistaken."

After the wedding feast was over, Danny Lemmons seized on his fiddle and made music fine enough and lively enough to set the nimble feet of the mountaineers to dancing. So that, take it all in all, the Christmas of the conscript was as jolly as he could have expected it to be.

When the festivities were concluded there was a consultation between Colonel Watson and Danny Lemmons, and then Captain Moseley and his men were told that they were free to go.

"What about Lovejoy?" asked Moseley.

"Oh, bless you! he goes over the mountain," exclaimed Danny, with a grin. "Lord, yes! Right over the mountain."

"Now, I say no," said Polly, blushing. "Turn the man loose an' let him go."

There were protests from some of the mountaineers, but Polly finally had her way. Lovejoy was unbound and permitted to go with the others, who were escorted a piece of the way down the mountain by Spurlock and some of the others. When the mountaineers started back, and before they had got out of sight, Lovejoy seized a musket from one of his men and turned and ran a little way back. What he would have done will never be known, for before he could raise his gun a streak of fire shot forth into his face, and he fell and rolled to the side of the road. An instant later Danny Lemmons leaped from the bushes, flourishing his smoking rifle.

"You see 'im now!" he cried. "You see what he was atter! He 'd better have gone over the mountain. Lord, yes! lots better."

Moseley looked at Chadwick.

"Damn him!" said the latter; "he 's got what he 's been a-huntin' for."

By this time the little squad of militiamen, demoralized by the incident, had fled down the mountain, and Moseley and his companion hurried after them.

Joel Chandler Harris.

FOURTEEN TO ONE.

A TRUE STORY.

BY ELIZABETH STUART PHELPS.

HERE are certain situations inherently too preposterous for fiction; the very telling of them involves the presumption of fact. No writer with any regard for his literary reputation would invent such a tale as that which I am about to relate. The reader will agree with me, I think, that the conclusive events of the story are but another evidence that truth is the most amazing thing in the world. With this prefatory word, which may give force to the narrative, I need only proceed to record the circumstances. For reasons which will be sufficiently obvious, I shall not make use of authentic names of either the persons or the localities involved in the recital of one of the most thrilling incidents in modern American history.

THE Reverend Mr. Matthews was hitching up his horse to go to the post-office. The horse was old; the man was old. The horse was gray; so was the man. The wagon was well worn of its paint, which was once a worldly blue, and the wheels sprawled at the axles like a decrepit old person going bowlegged from age. The Reverend Mr. Matthews did not use the saddle, according to the custom of the region; he was lame and found it difficult to mount.

It was a chilly day, and what was once a buffalo robe lay across the wagon seat; a few tufts of hair remained upon the bare skin, but it was neatly lined with a woman's shawl—an old plaid, originally combining more colors than a rag mat, but now faded to a vague general dinginess which would recommend it to the "low tone" of modern art. The harness was as old as the buffalo robe, as old as the shawl, as old as the horse, one might venture to say as old as the man. It had been patched, and mended, and lapped, and strapped, and tied, past the ingenuity of any but the very poor and the really intelligent; it was expected to drop to pieces at the mildest provocation, and the driver was supposed to clamber down over the bow-legged wheels and tie it up again, which he always did, and always patiently. He was a very patient old man; but there was a spark in his dim blue eye.

The reins, which he took firmly enough in his bare hands, were of rope, by the way. He could not go to the post-office on Mondays because his wife had to use the clothes-line. He felt it a special dispensation of Providence that women did not wash on Saturdays, when his copy of "Zion's Herald" was due.

She came out of the house when he had harnessed, and stood with her hands wrapped in her little black-and-white checked shoulder shawl, watching him with eyes where thirty years of married love dwelt gently. Something sharper than love crossed her thin face in long lines; she had an expression of habitual anxiety refined to feminine acuteness; for it was the year 1870, and it was—let us call it, since we must call it something, the State of Kennesee.

Mrs. Matthews stood in that portion of the house which Kennesee does not call a loggia; neither is it a porch, a piazza, or a hall. It results from the dual division of the house, which rises on each side, uniting in one boarded roof and a loft. Two chimneys of stone or of clay, according to the social status of the owner, flank the house on each side. The Rev. Mr. Matthews's chimneys were of clay, for he was a minister of the Methodist faith. His house was built of logs; through the space which cut the building the chickens walked critically, like boarders discussing their dinner. The domestic dwelling of a comfortable pig could be seen in the background. There were sheds, and something resembling a barn for the horse. All were scrupulously neat. Behind, the mountains towered and had a dark expression. A clear sky burned above, but one had to look for it, it was so far, and there seemed so small an allowance of it—so much of the State of Kennesee; so little of heaven.

"Are you going to the post-office?" asked Mrs. Matthews, softly. She knew perfectly well, but she always asked; he always answered. If it gave her pleasure to inquire, he reasoned, why not?

"Yes, Deborah," said the old man, briskly. "Want to go?"

"I don't know. Is Hezekiah tuckered out?" "Hezekiah is as spry as a chipmunk," returned the minister, confidently. Now Hezekiah was the horse, and thirty-one years old. He received this astounding tribute with a slow revolution of his best eye (for he was

blind in the other, but no one ever mentioned the fact in Hezekiah's presence) which might have passed for that superior effort of intelligence known only to the human race, and vulgarly called a wink.

"Well," said Mrs. Matthews, doubtfully, "I don't know 's I'll go."

She pronounced these words with marked, almost painful, hesitation, in an accent foreign to her environment. Her movements and dress were after the manner of Kennessee; but her speech was the speech of New Hampshire. They had been Northerners thirty years ago. Weak lungs brought him and a parish kept him. Thirty years—and such years!—seemed a long time to stay true to the traditions of youth and a flag. The parishioners and people whom, for courtesy, one called one's neighbors in those desolate, divided mountain homes, expressed themselves variously upon the parson's loyalty to the national cause. The Border State indecision had murmured about him critically, for the immediate region had flashed during the civil war, and remained sulky still.

The Confederacy had never lacked friends in that township. Of late the murmur had become a mutter. The parson had given offense. He had preached a sermon treating of certain disorders which had become historic, and for which the village and valley were acquiring unenviable notoriety.

"If I thought I could prevent anything," proceeded Mrs. Matthews anxiously, "I'd—I'd—I don't know but I'd go. Are you goin' to hold the meetin'—after all?"

"Certainly," replied the minister, lifting his head. "I shall dispense the Word as usual."

"Well," said his wife sadly—"well, I s'pose you will. I might have known. But I hoped you'd put it off. I was afraid to ask you. I can't help worryin'. I don't know but I'll go, too. I can get my bunnet on in a minute."

Her husband hesitated perceptibly. He did not tell her that he was afraid to take her; that he was almost equally afraid to leave her. He said:

"The lock of the back door is n't mended yet; I don't know but things need watching. That speckled bantam 's dreadfully afraid of weasels when she 's setting; I don't know 's I blame her."

"Well," returned the old lady with a sigh, "I don't know but you're right. If it 's the Lord's will I should stay at home and shoo weasels, I s'pose he can look after you without my help, if he has a mind to. Will you take the sweet potatoes along? There 's a bushel and a half; and two dozen eggs."

The two old people loaded the wagon together, rather silently. Nothing further was

said about the prayer-meeting. Neither alluded to danger. They spoke of the price of potatoes and chickens. The times were too stern to be spendthrift in emotion. One might be lavish of anything else; but one had to economize in feeling, and be a miser in its expression. When the parson was ready to start he kissed his wife, and said:

"Good-by, Deborah."

And she said, "Good-by, Levi."

Then she said: "Let me tuck you up a little. The buffalo ain't in."

She tucked the old robe about the old legs with painstaking, motherly thoroughness, as if he had been a boy going to bed. She said how glad she was she had that nice shawl to line it.

"Thank you, Deborah. Keep the doors locked, won't you? And I would n't run out much till I get back."

"No, I don't know 's I will. Have you got your lantern?"

"Yes."

"And your pistol?"

"No."

"Ain't you going to take it?"

"No, Deborah; I've decided not to. Besides, it 's a rusty old affair. It would n't do much."

"You'll get home by nine, won't you?" she pleaded, lifting her withered cheek over the high, muddy wheel. For a moment those lines of anxiety seemed to grow corrosive, as if they would eat her face out.

"Or quarter-past," said the parson, cheerfully. "But don't worry if I'm not here till half-past."

Hezekiah took occasion to start at this point; he was an experienced horse; he knew when a conversation had lasted long enough at the parting of husband and wife, in 1870, and in Kennessee. No horse with two eyes could see as much as Hezekiah. This was understood in the family.

A rickety, rocky path, about four feet wide, called by courtesy "The Road," wound away from the parsonage. The cornfield grew to it on each side. The tall stalks, some of them ten feet high, stood dead and stark, shivering in the rising wind. The old man drove into them. They closed about his gray head. Only the rear of the muddy blue wagon was visible between the husks.

"Levi! Levi! I want to ask a question."

She could hear the bow-legged wheels come to a lame halt; but she could not see him. He called through the corn in his patient voice:

"Well, well! What is it? Ask away, Deborah."

"What time shall I begin to worry, Levi?"

To this essentially feminine inquiry silence answered significantly:

"My dear," said the invisible husband after a long pause, "perhaps by ten — or half-past. Or suppose we say eleven."

She ran out into the corn to see him. It seemed to her, suddenly, as if she should strangle to death if she did not see him once more. But she did not call, and he did not know that she was there. She ran on, gathering up her chocolate-colored calico dress, and wrapping her checked shawl about her head nervously. At the turn of the path there was a prickly locust tree. It had been burnt to make way for crops after the fashion of the country, which is too indolent to hew; it had not been well burned, and one long, strong limb stretched out like an arm; it was black, and seemed to point at the old man as he disappeared around the twist in the path where the returning-valley curved in, and the passenger found a way to the highway. The parson was singing. His voice came back on the wind:

How firm a founda-tion, ye sa-aints of the Lo-ord!
She wiped the tears from her eyes and came back through the corn, slowly; all her withered figure drooped.

"I don't know but I'd ought to have perked up and gone with him," she said aloud, plaintively.

She stood in the house-place, among the chickens, for a few minutes, looking out. She was used, like other women in that desolate country, to being left much alone. Those terrible four years from '61 to '65 had taught her, she used to think, all the lessons that danger and solitude can teach; but she was learning new, now. Peace had brought anything, everything, but security. She was a good deal of a woman, as the phrase goes, with a set strong Yankee mouth. Life had never dealt so easily with her that she expected anything of it; it had given her no chance to become what women call "timid." Yet as she stood looking through the stark corn on that cold gray day she shook with a kind of horror.

Women know what it is — this ague of the heart which follows the absent beloved. The safest lives experience it, in chills of real foresight, or fevers of the imagination. Deborah Matthews lived in the lap of daily dangers that had not alienated her good sense, nor suffocated that sweet, persistent trust in the nature of things, call it feminine or religious, which is the most amazing fact in human life; but sometimes it seemed to her as if her soul were turning stiff, as flesh does from fear.

"If this goes on long enough, I shall die of it," she said. "He will come home some day, and I shall be dead of listenin', and shiverin',

and prayin' to Mercy for him. Prayer is Scripture, I suppose, and I have n't anythin' against it; but folks can die of too much prayin', as well as a gallopin' consumption or the shakes."

Only the chickens heard her, however, and they responded with critical clucks, like church members who thought her heretical. Since chickens constituted her duties, she would gratify Heaven and divert her mind by going out to see the setting bantam, who took her for a weasel and protested violently.

Mrs. Matthews came back to the house indefinitely comforted, in a spiritual way, by this secular interruption, and prepared to lock up carefully, as her husband had bidden her. It was necessary to look after all the creatures first: the critical chickens, the comfortable pig, the gaunt cow, and the Rooster, for whom, as he was but one, and had all the lordliness of his race, and invariably ran away from her, and never came till he got ready, Mrs. Matthews had a marked respect, and thought of him as spelled with a capital. It took a great while that evening to get the Rooster into the pen, and while her feminine coax and his masculine crow ricocheted about the cornfield, the old lady cast a sharp, watchful eye all over the premises and their vicinity. Silence and solitude responded to her. No intrusion or intruder gave sign. The mountain seemed to overlook the house pompously, as a thing too small to protect. The valley had a stealthy look, as if it were creeping up to her. The day was darkening fast. The gloom of its decline came on with the abruptness of a mountain region, and the world seemed suddenly to shrink away from the lonely spot and forget it.

Mrs. Matthews, when she had locked up the animals with difficulty, deference, or fear, according to their respective temperaments, fastened the doors and windows of the house carefully, and looked at the clock. It was half-past six. She took off her muddy rubbers, brushed them neatly, folded away her shawl, and started the fire economically. She must have a cup of tea; but supper should wait for Levi, who needed something solid after Friday evening meeting. She busied herself with these details assiduously. Her life was what we might call large with trifles; she made the most of them; there was nothing better that she knew of to keep great anxieties out of the head and sickening terrors out of the heart.

There was one thing, to be sure: Mrs. Matthews called it faith and providence. The parson's wife had her share of it, but it took on practical, often secular, forms. Sometimes she prayed aloud, as she sat there alone, quaking in every nerve. Sometimes she pitched her shrill old voice, as she did to-day, several notes above the key, and sang:

How firm a found-da-tion, ye sa-aints of the Lo-ord !
Is laid for your fa-ith in his ex-cel-lent word !

But she locked the house up before she sang.
She made her tea, too, and drank it.

"I always feel to get a better spiritual attitude," she used to say, "when I've had my cup of tea."

The house was so neat that its rudeness became a kind of daintiness to the eye ; and the trim old lady, in her chocolate calico with its strip of a ruffle at throat and wrists, sat before the fireplace, meditative and sweet, like a priestess before an altar. She used to hate that fireplace with hot New Hampshire hatred — the kettle, the crane, and all the barbarous ways of managing ; but she had contrived to get used to it now. It was the dream of her life to save money enough to freight a good Northern cook-stove over from Chattanooga. But she expected to die without it. The room winked brightly with shiny tin-ware hung above the fireplace, and chintz curtains at the windows. There were hollyhocks on the curtains which seemed like New Hampshire, if you made believe very much. There was a center-table with a very old red and black tablecloth of the fashion of fifty years ago. The minister's writing materials adorned this table — his tall inkstand, with its oxidized silver top : his first parish in New Hampshire gave him that inkstand, at a donation party, in a sleet storm one January night, with a barrel of flour and a bushel of potatoes. Beside the inkstand lay his quill pen sharpened with the precision of a man who does not do much writing ; the cheap, blue-ruled letter paper, a quire of it ; and the sacred sermon paper which Mrs. Matthews would not have touched for her life ; she would as soon have touched the sermons. These were carefully packed away in the corner in a barrel covered with turkey-red, and surmounted with a board top. The family Bible lay on the board.

Above rose the minister's "library." This was a serious affair, greatly respected in the parish and adored by the minister's wife. It took at least three poplar shelves stained by Mr. Matthews's own hand, and a borrowed paint-brush, to hold that library. Upon the lower shelf the family clock ticked solemnly, flanked by Cruden's Concordance and Worcester's Octavo Dictionary. For neighbors to these there were two odd volumes of an ancient encyclopedia, the letters unfortunately slipping from A to Z without immediate alphabetical connection. Upon such subjects, for instance, as alchemy or zoölogy, the minister was known to have shown a crushing scholarship, which was not strictly maintained upon all topics. Barnes's Notes on Matthew occupied a decorous position in the library. The

life of John Wesley, worn to tatters and covered with a neat brown paper grocery bag, overflowed into two octavo volumes, which, after all, had the comfortable, knowing look of a biography which treats of a successful life-experience, opulent in fact and feeling, alert and happy. Beside the shriveled career of this humble disciple, what a story !

The history of New Hampshire stood beside John Wesley. A map of the State of Tennessee surmounted the library. For the rest, the shelves were fatly filled with filed copies of "Zion's Herald" and a Chattanooga weekly.

There was an old lounge in the room, homemade, covered with a calico comforter and a dyed brown shawl. The minister's slippers lay beside it ; they were of felt, and she had made them. This lounge was Mr. Matthews's own particular resting-place when the roads were rough or the meeting late. If he were very late, and she grew anxious, his wife went up and stroked the lounge sometimes.

Their bedroom opened across the house-place from the living-room. It held a white bed, with posts, and old white curtains much darned. Mrs. Matthews's Bible lay on a table beside the bed. The room was destitute of furniture or ornaments, but it had a rag carpet and a fireplace. When Mr. Matthews had a sore throat and it was very cold they had a fire to go to bed by. That was delightful.

When Mrs. Matthews had taken her cup of tea and sung "How firm a foundation" till she was afraid she should be tired of it, which struck her as an impiety to be avoided, she walked about the house looking at everything, crossing from room to room, and looking cautiously after her. It was very still.

It was almost deadly still. How long the evening ! Seven—eight—half-past eight o'clock. She tried to sew a little, mending his old coat. She tried to read the religious news in "Zion's Herald" ; this failing, she even ventured on the funny column, for it was not Sunday. But nothing amused her. Life did not strike her as funny, that night. She folded the coat, she folded the paper, she got up and walked, and walked again.

Pretty little home ! She looked it over tenderly. How she loved it. How he loved it. What years had they grown to it, day by busy day, night by quiet night. What work, what sorrow, what joy and anxiety, what economy, what comfort, what long, healthy, happy sleep had they shared in it ! As she passed before the fire, casting tall shadows on the chintz curtains, she began to sing again, shrilly :

Home — home, dear, dear home !

Nine o'clock. Yes, nine ; for the rickety old clock on the library shelf said so, distinctly.

It was time to stop pacing the room; it was time to stop being anxious and thinking of everything to keep one's courage up; it was time to put the johnny-cake on and start the coffee; he would be hungry, as men-folks ought to be; God made 'em so. It was time to peek between the hollyhock curtains and put her hands against her eyes, and peer out across the cornfield. It was time to grow nervous, and restless, and flushed, and happy. It was not time, thank God, to worry.

The color came to her withered cheek. She was handsomer as an old lady than she had been as a young one, and the happier she grew the better she looked, like all women, young or old. She bustled about, with neat, housewifely fussiness. She knew that her husband thanked Heaven for her New England home-craft—none of your "easy" Southern housekeeping for Levi Matthews. What would have become of the man? As she worked she sang unconsciously, "Dear, clean home!"

The johnny-cake was baking briskly. The candles were lighted. The coffee was stirred, and settled with the shell of an egg; it was ready to boil. It was quarter-past nine. Mrs. Matthews's head grew a little muddled from excitement. She began again at the top of her voice:

How firm a foundation, ye sa-aunts of the Lo-ord!
Is laid for your faith in an ex-cel-lent home!

The clock wedged between the concordance and the dictionary struck half-past nine with an ecclesiastical tone; dogmatically, as if to insist on the point as a tenet on which she had been skeptical.

Mrs. Matthews stopped singing. She went to the window. The coffee was boiling over. The corn-cake was done brown. She pulled aside the curtain uneasily. The pine-wood fire flared, and blinded her with a great outburst of light. She could see nothing without, and stood for a moment dazzled. Then she began to look intently, and so accustomed her eyes to the masses of shadow and the lines of form outside. The road wound away abruptly, lost in the darkness like a river dashed into the sea. The cornstalks closed over it, stark and sear; she opened the window a little and heard them rustle, as if they were discussing something in whispers. Above the corn shot the gaunt arm of the prickly locust, burned and bare. The outlines of the mountain were invisible. The valley was sunk in the night. Nothing else was to be seen.

As she leaned, listening for the sedate hoofs of old Hezekiah, or the lame rumble of the blue wagon wheels, the Rooster uttered from his pen a piercing crow, and the bantam hen responded with an anxious cluck.

She could have killed either of these garrulous members of her family for the interruption. The chickens always crowed when she was listening for Mr. Matthews. When the irritating sounds had died away on the damp air with long, wavering echoes, a silence that was indescribably appalling settled about the place. Nothing broke it. Even the cornstalks stopped. After a significant pause they began again; they seemed to raise their voices in agitation.

"What in the world are they talkin' about?" she said impatiently. She shut the window, and came back into the middle of the room. The corn-cake was burning. The coffee must be set off. The supper would be spoiled. She looked at the Methodist clock. Mr. Cruden and the Rev. John Wesley seemed to exchange glances over its head, and hers. It lacked seven minutes of ten.

"But it is n't time to worry yet!"

The woman and the clock faced each other. She sat down before it. What was the use in freezing at the window, to hear the Rooster? and the talking corn? She and the clock would have it out. She crossed her work-worn hands upon her chocolate calico lap, and looked the thing in the eye.

What a superior, supercilious clock! What a theological, controversial clock! Was there ever a clock so conscious of its spiritual advantages? So sure it knew the will of the Almighty? So confident of being right about everything? So determined to be up and at it, to say it all, to insist upon it, to rub it in?

Five minutes before ten—three—two. Ten o'clock. Ten o'clock, said in a loud, clerical tone, as if it were repeating ten of the Thirty-nine Articles to a bishop.

"But, oh, not quite time to worry yet!" Ten minutes past. A quarter past. Twenty minutes. The woman and the clock eyed each other like duelists. Twenty-five minutes past ten. Half-past—Deborah Matthews gasped for breath. She turned her back on the clock and dashed up the window full-length.

The night seemed blacker than ever. A cloud had rolled solemnly over the mountain, and hung darkly above the house. The stalks of corn looked like corpses. But they talked like living beings still. They put their heads together and nodded. As she leaned out, trembling and panting, a flash of unseasonable lightning darted and shot; it revealed the arm of the locust tree pointing down the road. A low mutter of distant thunder followed; it rolled away, and lapsed into a stillness that shook her soul.

She came back to her chair in the middle of the room, by the center-table. The final struggle with hope had set in. It seemed as if the clock knew this as well as she. The tick-

ing filled her ears, her brain, her veins, her being. It seemed to fill the world.

Half-past ten. It was as if some spirit appealed to the minister's clock. Oh, tell her so softly! Say so, gently as religious love, though you be stern to your duty as religious law. Twenty-five minutes of eleven — a quarter of —

The woman has ceased to look the clock in the eye. It has conquered her, poor thing; and, now that it has, seems sorry for her, and ticks tenderly, as if it would turn back an hour if it could. Her head has dropped into her hands; her hands to her knees; her body to the floor. Buried in the cushions of the old rocking-chair, her face is invisible. Her hands have lifted themselves to her ears, which they press violently. She herself lies crouched like a murdered thing upon the floor.

Eleven o'clock. She must not, can not, will not bear it. Eleven o'clock. She must, she can, she shall. Past all feminine fright and nervousness, past all fancy, and waste of weak vision, and prodigal anxiety, past all doubt, or hope, or dispute, it is time to worry now.

Deborah Matthews, when it had come to this, sprang to her feet, gave one piteous, beaten look at the clock, then staid to look at nothing more. She flung open the door, not delaying to lock it behind her, and dashed out. She was as wild as a girl, and almost as agile. She ran over the rocks, and slipped in the mud, and sunk in the holes, and pushed into the cornfield, and thrust out her hands before her to brush the stalks away, and stood for a moment to get her breath underneath the locust tree. How persistently, how solemnly, that black arm pointed down the path. She felt like kneeling to it, as if it were an offended deity. All the Pagan in her stirred. Suddenly the Christian rose and wrestled with it.

"Lord have mercy!" she moaned. "He's my husband. We've been married thirty years."

"Hain't I prayed enough?" she sobbed, sinking on her knees, in the mud, among the corn. "Hain't I said all there's any sense in sayin' to thee? What's the use in pesterin' God? But, oh, to mercy, if thou couldst take the trouble to understand what it is to be married—thirty years—and to set here in the cornfield lookin' for a murdered husband. He can't," said Deborah Matthews, abruptly starting to her feet. "God ain't a woman. It ain't in nature. He can't understand."

She pushed on, past the burned trees and out towards the highway. It was very dark. It was deadly lonely. It was as still as horror. Oh, there —

What tidings? For good or for ill, they had come at last. Deep in the distance the wheels of a bow-legged wagon rumbled dully, and

the hoofs of a tired horse stumbled on the half-frozen ground. Far down the road she could see, moving steadily, a little sparkle, like a star. She dared not go to meet it.

Friend or foe might bear the news. Let it come. It must find her where she was. She covered her face with her shawl, and stood like a court-martialed soldier before the final shot.

"Deb-ora-h?"

Far down the road the faint cry sounded. Nearer, and advancing, the dear voice cried. He was used to call to her so when he was late, that she might be sure, and be spared all possible misery. He was infinitely tender with her. The Christianity of this old minister began with the marriage tie.

"Deb-ora-h? Deborah, my dear? Don't be frightened, Deborah. I'm coming. I've got home."

Kissing and clinging, laughing and sobbing, she got him into the barn. Whether she clambered over the wheels to him, or he sprang out to her, whether she rode, or walked, or flew, she could not have told; nor, perhaps, could he. He was as pale as the dead corn, and seemed dazed, stunned, unnatural to her eye. Hezekiah probably knew better than either of these two excited old people how they together got his harness off, with shaking hands, and rolled the wagon into the shed, and locked the outbuildings, not forgetting the supper of the virtuous horse who rests from his labors after fifteen miles on a Kennebec road, and at the age of thirty-one.

"Lock the doors," said the minister abruptly, when they had gone into the house-place. "Lock up everything. Take pains about it. Give me something to eat or drink, and don't ask a question till I get rested."

His wife turned him about, full in the fire-light, gave one glance at his face, and obeyed him to the letter. Perhaps, for the first time in her life, she did *not* ask a question. His mouth had a drawn, ghastly look, and his sunken eyes did not seem to see her. She noticed that he limped more than usual as he crossed the room to lay his old felt hat on the barrel-top beneath the library.

"You are used up," she said; "you are tuckered out! Here, drink your coffee, Levi. Here, I won't talk to you. I won't say a word. Drink, Mr. Matthews; do, dear."

He drank in great gulps exhaustedly. When she came up with the corn-cake, having turned her back to dish it, she heard a little clicking sound, and saw that his right hand closed over something which he would have hidden from her.

It was the old pistol; he was loading it, rust and all. The two looked at each other across the disabled weapon.

"It's all we have," he said. "A man must defend his own. Don't be frightened, Deborah. I'll take care of you."

"You might as well out with it," said the old lady distinctly. "I'm ready to hear. I'm not a coward. New Hampshire girls ain't. I should think you'd know I'd been through enough, in this God-forsaken country — for that."

"Well," slowly. "Well, I suppose you're about right, Deborah. The fact is, I've had a narrow escape of it. I was warned at the meeting. We had a gratifying meeting. The Spirit descended on us. Several arose to confess themselves anxious —"

"What were you warned about?" interrupted his wife. "Never mind the anxious seat. I've sat on it long enough for one night. What's the matter? Who warned you?"

"I was warned against the Ku Klux Klan, that's all," returned the parson simply, picking up the crumbs of corn-cake from his knees, and eating them to "save" the bread. "They lay in wait for me on the road home. I had to come round over the mountain, the other way. It was pretty rough. I did n't know but they'd detail a squad there. It was pretty late. The harness broke twice, and I had to mend it. It took a good while. And I knew that you —"

"Never mind me!" cried Mrs. Matthews, with that snap of the voice which gives the accent of crossness to mortal anxiety. "Tell me who warned you. Tell me everythin', this minute!"

"That's about all, Deborah. A colored brother warned me. He has been desirous of being present at all the means of grace, of late. But for the — the state of public sentiment, he would have done so. He is that convert brought to me privately, a few weeks ago, by our new brother, Deacon Memminger."

"I don't know 's I half like that Deacon Memminger," returned the wife. "He got converted pretty fast. And he's a stranger in these parts. His speech ain't our speech, either. But it's a Southern name. Did he warn you?"

"He was not present to-night at the dispensing of the Word," replied the minister. "No, I was taken one side, after the benediction, without the building, by the colored brother and warned, on peril of my life, — and on peril of his, — not to go home to-night, and to tell no man of the warning."

"But you did — you came home!"

"Certainly, my dear; you were here."

She clung to him, and he kissed her. Neither spoke for many minutes. It seemed as if he could not trust himself. She was the first to put in whispered words the thought which rocked the hearts of both.

"When they don't find you — what will they do?"

"My dear wife — my dear wife, God knows."

"What shall you do? What can we do?"

"I think," said the minister in his gentle voice, "that we may as well conduct family prayers."

"Very well," said his wife, "if you've had your supper. I'll put away the dishes first."

She did so, methodically and quietly, as if nothing out of the common course of events had happened, or were liable to. Her matter-of-fact, housewifely motions calmed him; as she thought they would. It made things seem natural, homelike, safe, as if danger were a delirious dread, and home and love and peace the foundations of life, after war, in Kennessee.

When she had washed her hands and taken off her apron she came back to the lounge and brought the family Bible with her, and the hymn-book. They sang together one verse of their favorite hymn, "How firm a foundation," with the quavering, untrained voices that had "led the choirs" of mountain meetings for almost thirty years of patient, self-denying missionary life. Then the parson read, in a firm voice, a psalm — the ninety-first; and then he took the hand of his wife in his, and they both knelt down by the lounge and he prayed aloud, his usual, simple, trustful, evening prayer.

"O Lord, our heavenly Father, thy mercies are new every morning, and fresh every evening. We thank thee that though danger walketh in darkness, it shall not come nigh us. We bless thee that thou art so mindful of thine unworthy servant and handmaiden. We thank thee that for nearly thirty years we have dwelt in conjugal love and peace beneath this comfortable roof. We thank thee that no disaster hath rendered us homeless, and that the hand of violence hath not been raised against us. We pray thee that thou wilt withhold it from us this night, that we may sleep in peace, and awake in safety —"

"Levi!"

A curdling whisper in his ear interrupted the old man's prayer. "Levi! There are footsteps in the corn!"

"And awake in safety," proceeded the minister firmly, "to bless thy tender care —"

He did not rise from his knees, but prayed on in a strong voice. So well trained to the religious habit was the woman that she did not cry out, nor interrupt him again, nor did she either arise from her knees before the old lounge.

Suddenly voices clashed, cries upsprang, and a din surrounded the house.

"Come out! Come out! Out with the Yankee parson! Out with the nigger-praying preacher! Show yourself!"

The old man's hand tightened upon the hand of his old wife; but neither rose from their knees. The confusion without redoubled.

Calls grew to yells. Heavy steps dashed foraging about the house. Cries of alarm from the outbuildings showed that the animals, which were the main support of the simple home, were attacked, perhaps destroyed. Then came the demand:

"Come out! Come out to us! Show yourself, you sneaking, Yankee parson! Out to us!"

A terrific knock thundered on the door. Steadily the calm voice within prayed on:

"We trust thee, O Lord, and we bless thee for thy mercy to us ward—"

"Open the door, or we will pull your shanty down to hell!"

"Preserve us, O Lord, for thy loving-kindness endureth forever—"

"Open the door, — you, or we'll set the torches to it, and burn you out!"

"Protect us, O God—"

The light lock yielded, and the old door broke down. With a roar the mob rushed in. They were not over sixteen, but they seemed sixty, storming into the little room. They were all masked, and all armed to the teeth.

Before the sight which met his eyes the leader of the posse fell back. He was a tall, powerful fellow, evidently by nature a commander, and the men fell back behind him.

"For Christ's sake, Amen," said the parson. He rose from his knees, and his wife rose with him. The two old people confronted the desperados silently. When the leader came closer to them he saw that the Rev. Mr. Matthews's hands were both occupied. With the left he grasped the hand of his wife. In the right he held his rusty pistol. The hymn-book had fallen to the floor; but the family Bible had been reverently laid with care upon the lounge, its leaves yet open at the ninety-first psalm.

"Gentlemen," said the parson, speaking for the first time, "I would not seem inhospitable, but the manner of your entering has perturbed my wife and interrupted our evening prayer, which it is our custom never to cut short for any insufficient cause. Now I am ready to receive you. Explain to me your errand."

"It's a — short one," said a voice from the gang; "a rope and a tree will explain it easy enough."

"And nothing less!" cried a hoarse man. "We have n't come on any boys' play this time. We've had chase enough to find you for one night."

"That's so. It's no fool's errand, you bet. We ain't a tar-and-feathering party. We mean business."

"Gentlemen! gentlemen!" pleaded the parson. He took the hand of his wife as he spoke, and lifted it to his shrunken breast, and held it there, delicately.

It was the piteous instinct of manly protection powerless to protect.

"In the name of civil justice, O my neighbors, wherein have I offended you?"

"That's our business. It's a serious one, too," cried the hoarse man. "Your — pious prayer-meetings have been a nursery of sentiments we don't approve, that's all. You've admitted a — darky among respectable white citizens. Come now, have n't you? Own up!"

"Certainly," replied the parson, promptly. "There was one colored brother present at the means of grace on one or two occasions. I regretted that my congregation did not altogether welcome him. He was converted by the mercy of God, beneath my ministrations. Would ye that I denied him the poor benefit of my prayers? Nay, then, as God hears me, I did not, nor I would not."

The old man's dim eyes flashed. He raised his rusty pistol, examined it, and laid it down. Before sixteen well-armed men he began to comprehend the uselessness of his old weapon. He looked upon the array of grotesque and ghastly masks steadily; they rose like a row of demons before his biblically trained imagination. Mr. Matthews believed in demons, in a simple, unquestioning way.

"And you've preached against that which was no business of yours. Come now, own to it! You've meddled with the politics and justice of the State. You have preached against the movements of the Klan — what's left of it."

"I own to it," said the parson, quietly. "I have delivered a discourse upon the topic of your organization. I felt called of Heaven to do it. Is that all ye have against me? I pray you, for my wife's sake, who is disquieted by your presence, as you see, to leave us to ourselves and go your way — from under my roof."

"Have him out! Right smart, now!" yelled the hoarse man. "Have him out without more words! A rope! A rope! Where's a rope?"

In a moment there was *mêlée* in the house. Cries arose to the effect that the rope was left in the corn. But a fellow who had been browsing about outside ran in with a rope in his hand and handed it to the hoarse man. The rope was Mrs. Matthews's clothes-line — Hezekiah's reins. The hoarse man gave it to the leader with an oath. The leader seemed to hesitate, and conferred in a whisper with the hoarse man and with others; but he was apparently overborne in his hesitation; he took the rope, and advanced with a certain respect to the parson, death in his hand, but who knew what pity in his heart? The mask hid it if any were there. The noise from the gang now increased brutally. Cries, oaths, curses, calls to death resounded through the pure and peaceful room.

The hoarse man lassoed the rope, and threw it around the parson's neck. At this moment a terrible sound rang above the confusion.

It was the cry of the wife.

She had possessed herself magnificently up to this time; the Puritan restraint set upon her white, old face; she had not said a word. No murderer of them all had seen a tear upon her withered cheek. But now nature had her way. She flung herself to her knees before the members of the Klan; then upon her husband's neck; back upon her knees—and so, in a passion wavering between agony and entreaty, pleaded with them. She cried to them for the love of Heaven, for the love of God, for the sake of "Jesus Christ his Son, their Saviour," so she put it, with the lack of tact and instinct for scriptural phraseology belonging to her devout, secluded life.

The phrase raised a laugh.

She cried to them for the love of their own wives, for the sake of their mothers, by the thought of their homes, for the sake of wedded love, and by his honorable life who had ministered respected among them for nearly thirty years—by the misery of widowhood, and by the sacredness of age. In her piteous pleading she continued to give to the murderers, at the very verge of the deed, the noblest name known to the usages of safe and honorable society.

"Gentlemen! *Gentlemen!* For the sake of his gray hair! For the sake of an old wife—"

But there they pushed her off. They struck her hands from their knees; they tore her arms from his neck, and so were dragging him out, when the parson said in a clear voice:

"Men! Ye are at least men. Give way to the demand of my soul before ye hurl it to your Maker. I pray you to leave me alone, for the space of a moment, with this lady, my wife, that we may part one from the other and no man witness our parting."

At a signal from the big leader the Klan obeyed this request. The men hustled out of the broken door. The leader stood within it.

"Watch 'em! Watch 'em like a lynx!" cried the hoarse man. But the leader turned his back.

"Deborah! Kiss me, my dear. You've been a good wife to me. I think you'd better go to your brother—in New Hampshire—I don't know. I have n't had much time to plan it out for you. Tell him I would have written to him if I had had time. Tell him to take good care of you. Oh—God bless you, my dear. Why don't you speak to me? Why don't you kiss me? Your arms don't stay about my neck. What! Can't hold them there—at this last minute? Pray for me, Deborah. Deborah! why don't you answer me? O my wife, my wife, my wife!"

But she was past answering; past the sacred

agony of that last embrace. She had dropped from his breast, and lay straight and still as the dead at his feet.

"God is good," said the old man, solemnly. "Let her be as she is. I pray you do not disturb her. Leave her to the swoon which He has mercifully provided for her relief at this moment—and do with me as ye will, before she awakens."

A certain perceptible awe fell upon the gang as the old man stepped around the unconscious form of his wife and presented himself in the doorway.

"He seems to be a grateful old cove," said one man in a low voice. "I don't know 's I ever heard a feller in his circumstances give God a good name before."

"No sniveling!" cried the hoarse man. "Have it over!"

They took him out, and arranged to have it over as quickly as might be. It must be admitted that the posse were nervous. They did not enjoy that night's work as much as they had expected to. They were in a hurry now to be done with it and away.

The old man offered no useless resistance. He walked with dignity, and without protest. He limped more than usual. His head was bare. His gray hair blew in the rising wind. The rope was around his neck.

Some one had wheeled out the blue wagon and rolled it under the locust tree. As this was done the old horse whinnied for his master from the stall. The parson was pushed upon the cart. Short work was made of it. As the leader of the gang stooped to help the hoarse man fling the rope over the burned bare limb of the tree and to adjust the noose about the old man's neck—which he made insistence on doing himself—a mask dropped. It was the face of the chief himself which was thus laid bare, and alas, and behold, it was even no other than the face of—

"Deacon Memminger!" cried the old minister, speaking for the first time since he had been dragged from the house. The leader restored his mask to his downcast face, with evident embarrassment.

"*You!*" said the parson. "I thought," he added gently, "that you had found a Christian hope. You communed with me at the Sacrament two weeks ago. I administered it to you. I am—sorry, Deacon Memminger."

The deacon muttered something, Heaven knew what, and fell back a step or two. Some one else prepared the rope to swing the old man off. He who was known as Deacon Memminger dropped to the rear of the gang, surveyed it carefully, then advanced to his place at the front, nearest to the victim. Every man awaited his orders. He was their chief. They

had organized and they obeyed, even in their decline, a military government. There was a moment's pause.

"I would like," said the doomed man gently, "a moment to commend my soul to God."

This was granted him, and he stood with his gray head bowed. His hands were tied behind him. His face was not muffled; it had a high expression. His lips moved. Those who were nearest thought they heard him murmur the first words of the Lord's Prayer. "Hallowed be Thy name," he said, and paused.

He said no more, nor seemed to wish it. So they ranged themselves, every man of them, to swing him off, each standing with both hands upon the rope, which had been spliced by another to a considerable length. He who was called Memminger stood, as he was expected, to give the final order. There were fourteen of them — and Memminger the chief. Beside him stood an idle fellow, masked like the rest, but apparently a servant, a tool of Memminger's, who had especial service for him, perhaps. If the old man struggled too much — or an accident happened — it was well to have an unoccupied hand. Memminger, in fact, had been well known in the gang for a good while, and was implicitly trusted and obeyed.

In putting their hands to the rope every man of them had of necessity to lay down his arms, both hands being clenched upon the rope, for a strong pull. They meant to break the old man's neck, and be done with it. Really, nobody cared to torture him.

"We're ready," said the hoarse man. "Give the signal, Cap'n. Hurry up."

The light of their lanterns and torches revealed the old man clearly — the long arm of the locust above his head — the stormy sky above. Death was no paler than the parson, but he did not struggle. His lips moved still in silent prayer. His eyes were closed. The men bent to the rope. The chief raised his hand. The last signal hung upon his next motion.

Then there was a cry. Then his mask dropped, and from the face of the man beside him another fell, and it was the face of a negro, obedient and mute. Then the powerful figure of the leader straightened. His familiar eye flashed with a perfectly unfamiliar expression. Two muscular arms shot out from his body; each hand held a revolver sprung at full-cock and aimed.

"Boys!" he cried in an awful voice, "I am an officer of the United States! and the first man of you who lets go that rope, DROPS!"

In an instant, armed as he was, he covered them, every man of them unarmed and standing as they were. His negro servant sprang to his aid.

"The first man of you who stirs a muscle on that rope, dies!" thundered the quasi "Deacon" Memminger. "I am a deputy marshal, authorized by the National Government to investigate the Ku Klux Klan, and, in the name of the Stars and Stripes, and law and order, I arrest you, every man!"

And, in the name of simple wonder and astounding history, it was done. The negro servant, whose person bulged with hidden handcuffs, bound the men, one at a time, fourteen of them, while his master's experienced weapons covered the gang. They behaved with the composure of intelligent and dumfounded men. One of them ventured an observation. It was the hoarse man. He said:

"—— ——— you — to ——," struggled mightily with his handcuffs, and then held his tongue. The whole posse, by means of this simple stratagem, and by the help of that cowardice elemental in all brutes, was marched to the nearest sheriff; then delivered intact to the power of the law which the great mass of Kennessee citizens were ready to respect and glad to see defended. The county rang with the deed. Then whispers arose to hush it, for shame's sake. But it crept to Northern ears, and I record it as it was related to me.

"How is it, Parson?" said Deacon Memminger with a bright, shrewd smile, as he cut the old man down, and helped him, trembling as he was, to dismount the shaky cart. "How is it, sir? Are you sorry I came to church at your place — now? I thought — under the circumstances — and I was bound to save you. I and my daky boy have been ferreting out this thing for a hundred days. I joined 'em the first week I came down here. I came on from Washington to do it. We mean to make a thorough job of it — and I guess we've done for 'em, this time. You'll excuse me, sir, but I've got to get 'em to the sheriff, and — I'd go back and see my wife now, if I were you."

SHE came to herself and to her misery soon enough, lying there upon the floor beside the lounge. The first thing which she saw distinctly was the Bible, opened at the psalm which has calmed more souls in shocks of danger, and in the convulsions of lawless times, than any other written words known to the literature of the race.

But the first thing which she heard was his precious voice, pitched low, and modulated tenderly, so as not to frighten her.

"Deb-orah! Deb-orah! Don't be scared, my dear. They have not hurt me — and I'm coming back to you."

Elizabeth Stuart Phelps.

TOPICS OF THE TIME.

Some Christmas Reflections.

PERHAPS our readers may find as much of the true Christian feeling in Dr. Abbott's article, and in the article on the Record of Virtue, as in the more ostensibly Christmas "features" of this number of THE CENTURY. Good people of other religions sometimes resent the Christian habit of insisting that all the modern and civilized agencies and enthusiasms for the bettering of humanity are essentially Christian. We can imagine the smile that must have illuminated the countenances of some of our Hebrew friends when, after the death of Montefiore, certain Christian doctors of divinity generously undertook to overcome, in various learned essays, the theological difficulties as to the entrance of that great benefactor into the rewards of Heaven. It was, we remember, the kindly and timely enterprise of one of our religious weeklies that set these good doctors to work; and we have no doubt that St. Peter of the Keys was greatly indebted to them for promptly pointing out a legitimate escape from an extremely awkward situation.

But Christians should not be blamed, after all, for finding in their religion the potency of all good. It is the distinction of Christianity that spiritual progress and good works go hand in hand in its system, rightly understood. The solitary, selfish, soul-saving, hermit view of the Christian life is a remnant of other religions and as far as possible from the true "imitation of Christ." In Professor Drummond's remarkable sermon on "The Greatest Thing in the World" perhaps the most striking passage is this: "Have you ever noticed how much of Christ's life was spent in doing kind things—in *merely* doing kind things? Run over it with that in view, and you will find that he spent a great proportion of his time simply in making people happy, in doing good turns to people." We know of a good man who would probably deprecate the title of "Christian," yet who, when thanked for some notable act of thoughtful kindness to a whole schoolful of boys, said that he deserved no thanks at all, because he had only acted on the principle he had long ago discovered, that "if you want happiness yourself in this world you must disseminate happiness."

But the Christian idea includes along with the dissemination of happiness also the dissemination of misery—misery to evil-doers. "And Jesus entered into the temple of God, and cast out all them that sold and bought in the temple, and overthrew the tables of the money-changers, and the seats of them that sold the doves; and he saith unto them, It is written, My house shall be called a house of prayer: but ye make it a den of robbers." It was doubtless with a view to this phase of the energy of the highest example of the Christian life that clergymen in the city of New York and in the State of Pennsylvania entered with such zeal into the moral issues of the campaigns of last month. Nothing that our spiritual leaders have done in our day has been more effective in increasing the respect of the general community for their sincerity

and godliness. For, let us remember in this Christmas season of beneficence, of mutual kindnesses and of happiness, that Christianity is not only a religion of love, but a religion of hatred—of love for God and man, and hatred of all the evils in human character and in the entire social economy.

Trees in America.

WE spoke in the November CENTURY—and not by any means for the first time—of the meaning of forest preservation and of its importance as a factor in the future welfare of our country. Since that number went to press the proposed Yosemite National Park, described in our September number, has become a reality by the enactment of General Vandever's bill. By this result, for which the people of the country are largely indebted to the activity of Mr. Holman of the House of Representatives and of Mr. Plumb of the Senate, not only an important addition is made to the area of wonderful scenery reserved for public use, but an end is put, within considerable limits, to the depredations of lumbermen and sheep-herders. Another important gain, and one of great practical value, is the protection which this new reservation insures to the headwaters of the San Joaquin, Merced, and Tuolumne rivers—thus not only insuring a larger and steadier flow of the cataracts and falls of these streams, but conserving the water supply of the foothills and valleys below. Not less important was the passage by the Senate of the resolution of Senator Plumb, directing the Secretary of the Interior to make a prompt and careful report in regard to the spoliation of the Yosemite. The Secretary has shown an active interest in the new public reservations of California, and there is every reason to believe that he will make a searching investigation into these only too well proved abuses. In doing this it is greatly to be hoped that he will avail himself of the services of some capable and disinterested landscape architect of reputation. Happily there are several in the country who would meet the requirements of the occasion.

A very important measure is still pending, and should surely be acted upon favorably by the present Congress. We refer to the Act for the Protection and Maintenance of the Yellowstone National Park, which has passed the Senate and is now before the House of Representatives, having been reported favorably from the Committee on Public Lands. This bill, if we are not mistaken, has in fact passed the Senate four times, and is apparently only opposed by a lobby in the interest of a railroad scheme.

Unquestionably a wider and deeper interest in the general subject of forest preservation is now felt than was felt a few years ago, and the nature of the measures, public, corporate, and private, which will best insure the protection of our woodlands is more clearly understood. But much enlightenment, and especially much awakening of enthusiasm, are needed if the nation as a whole is to do its duty in forest preservation and also in the guarding of particularly beautiful passages

of scenery and exceptionally fine pieces of woodland or individual trees. Cold wisdom may do much; a genuine interest in Nature's productions, an enthusiastic love for them, can do more. To keep what will serve us is one motive; to keep what delights us is quite another; and both must work together in this case if we wish not only to do the best for ourselves but to respect the lawful rights of posterity.

Now, really to love a thing we must know it. There is no way in which a vital interest in it can be quickly and surely excited except by changing a vague and imperfect knowledge of its qualities into full and accurate knowledge. It is not the casual summer tourist, but the landscape gardener, who knows how impossible it is to create a bit of landscape like Nature's best, that protests most vigorously against the desecration of such bits. It is the botanist, the dendrologist, the trained student and practised lover of Nature, who cries out most loudly against the folly of mountain denudation—not the farmer or manufacturer, though his may be the material interests immediately at stake. To save our forests and landscapes and administer them wisely we must love them, and to love them we must know them. But those who have traveled farthest among them best understand how difficult it is to gain real acquaintance with them. Who among the other travelers or the residents we meet can tell us about our trees—whether a species is common or rare, what is its natural range, what is its adaptability to cultivation in other places, what the value of its various products, what its relative importance among the score of other species around it? And where are the books from which we can gather such information?

In fact, the first volume of the first book to meet the wants of Americans in this important direction has just been published. But the work promises to be, when complete in its twelve volumes, so adequate to every need, scientific and popular, that it merits an especially hearty welcome.

The time was ripe for an exhaustive and accurate survey of the arborescent species of our country, but only just ripe. Until the great West had been opened up in all directions by the railway, no botanical collector could feel sure that he had reaped the full riches of its forests, no systematic botanist could regard the families and genera of North American trees as more than provisionally established. Fortunately the advent of the time of full knowledge is now being recorded by a dendrologist who has played an important part in bringing it about. Professor Sargent's connection with the North Transcontinental Survey, his journeys in the service of the National Government when charged with the preparation of that volume of the Tenth Census Reports which treats of the forests of our country, his work in forming the Jesup Collection of Woods in the New York Museum of Natural History, and his present position as director of the Arnold Arboretum, which he has made the richest dendrological collection in America and to which he has given international scientific importance—all these labors furnished him with unequalled opportunities to fit himself for writing "The Silva of North America"; and he tells us in his preface that during them all the intention to write it was steadily in his mind. No one else, at home or abroad, was so well equipped as Professor Sargent to do this special piece of work.

His book, as we have implied, will replace no existing work—it will fill a crying vacancy. All that had previously been written about American trees was either fragmentary or to some degree incorrect; and the best of it was hidden away from the ken of the public in botanical monographs or the files of scientific journals. The only general work which could rightly pretend to the name of a Silva of North America has been the one first published by Michaux in 1810, and supplemented in 1842 by Nuttall; and this, of course, is sadly antiquated—incomplete in scope, and imperfect even as far as it goes. Other Silvas have been begun and not finished, or have been mere incorrect compilations from the writings of various authors. Even local handbooks, like Emerson's "Trees and Shrubs of Massachusetts," have not been numerous or often good. No botanist has hitherto been able fully and accurately to compute, distinguish, and understand our trees. No horticulturist or landscape gardener has had it in his power to select among all the species possible of cultivation in a given locality. No architect or cabinet-maker has had an explanatory list of all the woods he might advantageously use. And the lover of Nature has been perpetually balked of his wish to identify the species he has found in his travels. Nothing was more needed in our literature than a complete and detailed work, written from first-hand observation, which should systematize our trees for the scientific student and explain and illustrate their appearance and qualities for the public.

The Railway Zone-Tariff of Hungary.

THE extent to which the nations of the earth are sharing one another's life is illustrated not merely by the economic exchanges which no barriers of hostile legislation quite succeed in suppressing, but also by the contributions of political and industrial experience which each is making for the benefit of all. Some of the most useful of these come from quarters to which we might not have looked for original suggestions. For the method of ballot reform which is so widely adopted we are indebted to Australia; and now from Hungary we have a suggestion of reform in railway management which promises to revolutionize the passenger business.

The "Zone-tariff," as it is called, was put in operation in Hungary on the 1st of August, 1889. It has, therefore, but a brief experience to justify its practicability; but the results thus far have been so remarkable that its success seems to be assured. The method consists of a division of the territory of Hungary into fourteen concentric zones, Budapest, the capital, being the center. The first zone includes all stations within 25 kilometers—16½ miles—from the center; the second, all more than 25 and less than 40; all the zones except the first, the twelfth, and the thirteenth are 15 kilometers, or a little more than 9 miles in width; the three named are 25 kilometers in breadth, and the fourteenth includes all stations more than 225 kilometers from the capital. The fare is regulated by the number of zones which the traveler enters or crosses during his journey. Reducing guldens to cents, the rate is 20, 16, and 10 cents per zone, for first, second, and third class passengers respectively. If one starts from Budapest and crosses three zones he travels,

therefore, 55 kilometers, or about 34 miles: if he goes first-class, his fare will be 60 cents; if second-class, 48 cents; if third-class, 30 cents.

For local traffic, when the traveler does not cross the boundary of any zone, there are special rates; if he goes only to the nearest station, the charges will be 12, 6, and 4 cents; if to the second station from his starting-point, 16, 9, and 6 cents; if to the third station, the full rates of the zone are charged.

The greatest reduction, however, is in the long distances. For all stations more than 225 kilometers — 150 miles — from Budapest the rates are the same. All stations beyond that distance are reckoned in the fourteenth zone. It costs no more to travel from Budapest to Brasso, which is 729 kilometers distant, than to Nagy Varad, the distance of which is only 245 kilometers. To this farthest point, 442 miles from the capital, the fares of the three classes are, for ordinary trains, \$3.20, \$2.32, and \$1.60. At this rate the first-class fare from New York to Chicago would be only about \$7.00, and the third-class fare about \$3.50.

The former rates of the Hungarian railways between the two points now under consideration were \$16.84, \$11.56, and \$7.68. The fare is, therefore, less than one-fifth of what it was under the old system.

It is in these long distances that the reduction is most sweeping; but even the shorter journeys are greatly cheapened. To Arad, which is 253 kilometers from Budapest, the former fare for the three classes was \$6.16, \$4.32, and \$3.08; the present fare is \$3.20, \$2.32, and \$1.60, a reduction of almost 50 per cent.

Besides the reduction in rates, the new system offers great advantages in the way of convenience and simplification. The number of distinct tickets always kept on sale in every important hotel office was formerly about 700; the greatest number required in any office is now only 92. This reduces considerably the expense of printing and of handling tickets. They are now sold like postage stamps, at news-stands, post-offices, hotels, cigar-shops, and other such places. Any traveler knows what his fare will be if he knows how many zones he is to cross; he simply multiplies the number of the zones he is to enter or cross by the normal rate of fare per zone, which is, as has been explained, twenty, sixteen, and ten cents for the three classes respectively.

For a large number of places within fifty-five kilometers of Budapest ticket-books containing from thirty to sixty tickets are issued at rates still lower. Thus for a group of stations averaging about twenty-one miles from Budapest books are sold which make the trip fares sixteen, twelve, and eight cents. These books are transferable, and the owner of the book may pay with these tickets the fares of persons accompanying him. Evidently the purpose of this system is to extend these concessions and conveniences as widely as possible, and not, as often in America, to limit and circumscribe them so that the smallest number of people shall get the advantage of them.

The reader will be interested in knowing what re-

sponse has been made by the Hungarian public to these liberal measures. The Hungarian public is not particularly responsive, the population of the country is sparse, they are a poor, unenterprising, home-keeping people; but they seem to know a good thing when they see it. The increase in the passenger traffic has been very great. For the first eight months of the new system the number of passengers carried was 7,770,876; for the corresponding months of the previous year the number carried was 2,891,332. It may be supposed that this increase was mainly due to the great reduction in the long-distance rates. On the contrary, the gain is the largest in the traffic between neighboring stations. Of such passengers there were under the old system 255,000; under the new, 4,367,586.

This vast increase of business has also been accompanied by a substantial increase of revenues. Comparing the receipts from passengers and baggage of the first six months of the new system with the corresponding months of the previous year, we find a gain of \$361,880. It is also stated that there has been no material increase in operating expenses. Under the old system the cars were not often more than one-third full.

It is not to be wondered at that railway managers from all parts of the world are hastening to Hungary to study on the ground this remarkable phenomenon. It is to be hoped that some of our own may go and return with new light on a great question.

To what extent the experience of Hungary could be made available in America it is not easy to say. Part of the Hungarian railways belong to the state, but part of them are under the control of private companies; it would appear, however, that the right of the state to regulate fares must be conceded. The document from which this information is derived is published by the Hungarian government, and it consists of an elaborate but very intelligible compilation of the rules and methods of classification under which the business is done.

One fact is clearly demonstrated — that reduced passenger fares greatly stimulate passenger traffic, and are advantageous to the companies. There are indications enough of this fact in the experience of American railways, but the managers are slow to act upon them. Perhaps this striking illustration from Hungarian railway history may quicken their apprehension.

The economic and industrial advantages of such low fares should be obvious to all. Whatever tends to promote the mobility of labor is in the interest of thrift and peace. Especially is this true in these times when through changes of fashion production is constantly shifting: if the work-people thrown out of employment in one place could easily and cheaply remove to some other place where laborers are wanted, suffering would be relieved, pauperism diminished, and the congestions of labor, out of which many difficulties arise, greatly reduced. The high rates of railroad fare prevent the free movement of labor, and aggravate many of our social ills.

OPEN LETTERS.

Election by the Majority.

THE acknowledged purpose of an election is to register the will of those who vote.

As there are different types of people, so there are many wills in any given community. The wills vary and are divided, or, perhaps more properly, formed into groups by various circumstances, such as interest, education, locality, habits of thought, and the like. These groups should have some means of asserting themselves, and such means should, as far as possible, give weight to their views in proportion to the numerical strength of each.

Our present methods of election are not conducive to the expression and registration of the different shades of political opinion. They tend rather to suppress than to recognize such difference. This is so far true, and the votes of small parties are so certain to prove ineffectual, that they are said to be cast into the air. It has frequently happened that many of the votes thus lost were cast on principle and by the most advanced thinkers for the time being. Such votes are apt to be conscience votes, and the loss of conscience votes is a serious loss to the State.

At present we have two kinds of elections with reference to the number of officers to be elected — single and plural. Single elections are those where a single person is chosen to office by the electors of a particular district, such as a governor, a mayor, and the like. Plural elections are those where several officers of the same class or grade are chosen on general ticket from the same district, as is the case with presidential elections.

While these methods differ in the form of the ticket, that may be said to be the only difference. In the one case a majority or plurality elects the single officer, in the other case the same majority or plurality elects all the officers on the general ticket, be they few or many. Should there chance to be more than two tickets in the field, they might receive almost an equal vote, but the ticket having the largest number by one vote would be elected.

I have assumed that the right to govern resides in the majority. This right to rule may be effectuated in two ways.

First. By securing the election of the single officer who is to rule.

Second. By securing the election of the major part of an official body composed of several members, such as legislative bodies. In the latter case only is a representation of both the majority and minority possible. But I shall here speak of the single election only. Mr. Hare's system of election and others have referred more particularly to plural elections.

A perfect election is a unanimous election. In such case no vote can be said to have been lost or to be ineffectual. In proportion as an election varies from this standard it is imperfect. But so long as an election is permitted by less than the whole number of votes, so long will ineffectual votes be cast.

The method of election here presented is designed more exactly to ascertain and register the will of the persons voting; to reduce, as far as possible, the num-

ber of ineffectual votes, and to aid the majority to unite on the choice of a single officer. Before describing the method in detail, it may be well first to define two words as very commonly used in politics, viz. : majority and plurality. The former means more than one-half of all the votes cast. The latter ordinarily means a number of votes cast for any candidate which is greater than the number cast for any other candidate, though generally less than a majority. For example, if A receives fifty-one votes and B forty-nine, A is said to have a majority. If A receives thirty-three, B thirty-three, and C thirty-four, C is said to have a plurality.

In endeavoring to improve our system of election care must be taken to command the confidence of the people. Radical changes will not be favored. A system should be such that the votes cast can be returned in a form convenient for examination, that the public may compute and ascertain for itself the result of an election. For these reasons only a comparatively slight change in present methods is here proposed, viz. : that each voter be allowed to add to his ballot the name of his second-choice candidate, to be considered and counted only in case the candidate of his first choice fails of an election.

This method can be easily understood by the voter as it simply gives him the privilege of a second choice. It allows him to say : I desire to vote for A if he can be elected, and if he cannot let my vote be counted for B. The manner of making the preference known is quite immaterial. It may be done by the order in which the names are placed on the ballot or otherwise. Where the Australian method of voting is used, the voter could indicate his first and second choice by placing appropriate characters, such as 1 and 2, opposite the names of the candidates of his first and second choice.

The next step under this system of election would be the making of proper returns. Had the voter the privilege of making three choices the returns would be much more complicated, while a fourth choice would still further multiply complications. As the voter cannot go beyond the second choice, the returns can be made with comparative ease. Of course the second choice would add somewhat to the labor of the canvassers under present methods, if returns were made of the second choice. But as it would not be necessary to consider the second choice except where there was no majority on the first choice, it might not be thought necessary on the first canvass to make any return of the second-choice votes. Probably, however, it would be better to have both the first and second choice votes counted and registered in the regular returns, that all may know the exact result.

In canvassing the vote, ballots would be first assorted into piles, one pile for each candidate having a first-choice vote. The number of ballots in any given pile would be the number of votes that particular candidate received on first choice, and would be so entered in the returns. Thereafter the various piles of ballots could be re-assorted in like manner according to the second choice and the results entered accordingly. The returns could then, for example, be tabulated thus :

FIRST CHOICE.		SECOND CHOICE.		C.	Blank.
A.	B.	A.	B.	C.	Blank.
A.....	7.....	1.....	1.....	6.....	0.....
B.....	20.....	7.....	1.....	10.....	3.....
C.....	18.....	5.....	7.....	6.....

In such a form it may be seen that one line would indicate two things: 1. The number of votes cast for a particular candidate on the first choice. 2. Exactly how the voters casting those ballots desire their votes to be distributed among the other candidates as second choice, in case their first-choice candidate should fail to be elected.

Before considering the manner of ascertaining the result of an election by means of the second-choice votes it may be well to examine as a whole the returns as given above. They show: 1. That no candidate received a majority on the first choice. 2. That all who voted did not care to make a second choice. 3. That the form of the returns shows exactly how the voters who voted for each candidate on their first choice distributed their votes on second choice. 4. That under the present method of election B would be elected by a plurality vote, notwithstanding A's and C's supporters might prefer some one else. 5. That if the voters who cast their first-choice votes for A could be counted according to their second choice, C would be credited with six additional votes, and B with one additional vote, making B's total 21 and C's 24.

The returns being completed in the form above given the result of the election would remain to be ascertained. In case any candidate should have a majority of all the first-choice votes it would be useless to pursue our inquiry any further, for the majority must rule and elect its candidate. If, on the other hand, no candidate should receive a majority on the first choice, it would be apparent that the will of the majority of the voters could not be ascertained by considering only the first-choice votes. But as we are enabled to read the will of the voters by means of the second choice, we know how they desire their votes to be counted in case their first choice should prove ineffectual. The important point, however, would be the determination of what votes should be treated as ineffectual.

That first-choice votes may have effect as far as possible, it is proposed to distribute according to their second choice the votes cast for the candidate receiving the smallest number of first-choice votes. This would require, in our preceding example, that the votes cast for A on the first choice be counted according to the second choice. As we have seen, this would give B one additional vote and C six additional votes, making B's total 21 and C's total 24. C would then have a clear majority of all the votes cast, and would be elected.

Should no candidate receive a clear majority after the distribution of the votes originally cast for the candidate receiving the smallest number of votes on the first choice, the same process would have to be repeated as to the candidate having the next smallest number of votes to his credit, until such was the result or until only two candidates were left, when the one having the greater number of votes would necessarily be declared elected.

The rules for the election of a single officer may be stated as follows:

Voter's Rule.—Let each voter place on his ballot the names of two candidates most acceptable to him, indicating his preference.

Making Returns.—Canvass the ballots and make returns in the form heretofore given.

In that form they will show: 1. How many ballots are cast for each candidate as a first choice. 2. How many of that number are cast for each other candidate as a second choice. In other words, it will appear how many voters have supported each particular candidate as first choice, and how his supporters distribute their support on second choice.

Ascertaining Result.—1. If the name of any candidate stands as first choice on a majority of all the ballots cast, he is elected.

2. If no candidate is thus elected, to the number of first-choice votes cast for the respective candidates (except the one having the least number) add the number of second-choice votes cast for each candidate by those voters who have voted for the candidate having the least number of first-choice votes.

3. If no candidate thus secures a majority, the process must be repeated (distributing each time according to their second choice the votes of the voters who voted on the first choice for the candidate who has the least number of votes to his credit) until such is the result, or until only two candidates remain, when the one having the greater number of votes to his credit will be elected by a majority or plurality, as the case may be.

That the method of ascertaining the result may be more clearly understood, I will endeavor to illustrate by means of the returns of the mayoralty election of 1888 in the city of New York. The figures given as the first choice show the actual vote in round numbers. The figures given to indicate the second choice are of course purely arbitrary. Let us assume that at the last mayoralty election the above described system was in use, that the votes were on first and second choice distributed as shown by the following supposed returns, and that we desired to ascertain the result.

FIRST CHOICE.	SECOND CHOICE.					
	Grant.	Erhardt.	Hewitt.	Coogan.	Jones.	Blanks.
Grant.....	114,000..	10,000..	75,000..	25,000..	1,000..	3,000
Erhardt..	73,000..	10,000..	60,000..	1,000..	1,000..	1,000
Hewitt..	71,000..	10,000..	50,000..	6,000..	1,000..	4,000
Coogan..	9,000..	2,000..	1,000..	5,000..	100..	900
Jones....	2,000..	500..	100..	1,000..	300..	100

After adding together all the first-choice votes, we find that there were 269,000, of which number 134,501 constitute a majority. As no candidate has received so large a number of votes, we proceed (Rule 2) to add to the number of first-choice votes cast for the respective candidates (save the one having the least number) the number of second-choice votes cast for each candidate by those voters who have voted for the candidate having the least number of first-choice votes. This would remove Jones from the contest and give to Grant, Erhardt, Hewitt, and Coogan each an additional number of votes according to the popularity of each among the original supporters of Jones. Their amounts would then stand: Grant, 114,000+500=114,500; Erhardt, 73,000+100=73,100; Hewitt, 71,000+1000=72,000; Coogan, 9000+300=9300.

As no candidate yet appears to have a majority, the process must be repeated (Rule 3), distributing this time, according to their second choice, the votes cast for Coogan, as he is the candidate who has the least

number of votes to his credit. Thus we find the supporters of Coogan, by means of their second-choice votes, contribute 2000 additional votes to Grant; 1000 to Erhardt, and 5000 to Hewitt, making their totals: Grant, 116,500; Erhardt, 74,100; and Hewitt, 77,000.

Still there is no majority, and there are more than two candidates in the field. The process must be repeated once more (Rule 3). Again proceeding to distribute according to their second choice the votes of those voting for the candidate having the least number of votes to his credit, Erhardt's supporters contribute 10,000 additional votes to the credit of Grant, and 60,000 to the credit of Hewitt, making their totals: Grant, 126,500, and Hewitt, 137,000. This would give Hewitt an election by the majority of all the votes cast. If, however, he had received less than 134,501 votes, but a larger number than Grant, he would still be elected, but by a plurality vote.

As the figures above given are not intended to be based on probabilities, it is left for those claiming political sagacity to work out for themselves, if they desire to do so, what would have been the result of that election had it been conducted under the foregoing plan.

Tests of this method can easily be made in any voluntary association where the same points would arise as upon the application of the plan to popular elections.

Such a system of election can, I believe, be instituted in this State of New York, as well as in many others, simply by an act of the legislature and without any constitutional amendment.

Higher Education : a Word to Women.

"Behold, I have set before thee an open door, and no man can shut it."

THE door has been opened; women are pressing to the front, crowding the ranks and filling the avenues once open only to men; they have entered the struggle, competing on equal terms and side by side with the stronger sex, making themselves the bread-winners, and doing the actual work of the world—in a word, taking active, intelligent, and resolute part in the march and progress of humanity. It seems almost as if a new race had been created, a new tide of being had set in, and new forces had been called into play, beginning a new era in the world's history, and—if woman so wills it—the moral and social regeneration of mankind. But before taking possession of the kingdom which is hers she would do well to pause for a moment on the height already gained and carefully scan the horizon, looking with her own eyes clearly into the past and clearly into the future so as to discern its whole drift and significance; bringing to bear her own independent judgment and insight upon the world as it is—as men have made it—and upon the world as it may be and as woman may help to make it, if she will trust her own genius and prerogative as woman—something other than man—over and above any calling or profession she may choose to adopt. In the enthusiasm for a new cause certain watchwords are caught up that fire the imagination, certain foregone conclusions are accepted that have not been very closely tested or examined. The term "higher education" has come to be looked upon as the "open sesame," the key to woman's emancipation and advancement—

in fact, the solution of her destiny. As commonly and somewhat vaguely understood, higher education means instruction in the so-called higher branches of learning, the study of Latin and Greek, of the sciences in general or some special course, and finally the training for a profession, or for some of the higher industries or arts.

In our intensely acquisitive age, so bent upon the conquest and possession of things material and physical, it is not surprising that the question is often asked whether men have any use for a liberal education which does not fit them for the practical needs of life and for the struggle which every day grows keener, more selfish and more personal. Setting aside, however, a point of view that condemns advanced education on the ground that it is not materialistic enough, not utilitarian, not special enough to suit the wants of the times, we hear graver objections urged by those well qualified to judge, on the very ground that it is too materialistic, too much given over to the utilities, and too highly specialized to meet the true ends and broad purpose of culture—the unfoldment and best direction of man's highest faculties, the raising of his rank in the moral and social order, and the adjustment of his relations to the great universe around him, the seen and unseen. From infancy the physical senses are trained to a nicety; the child is taught accurately to observe and examine—to note every detail and discover the properties, the structure and "mechanism," of every natural and material object that comes within reach of outward and external sense. But there is a hidden sense as well—the vital principle itself, which may pass unperceived, undetected by the most minute microscopic investigation. The flower is picked to pieces, but the life, the soul, the fragrance, may exhale without recognition. Even the living creature is sacrificed—the frog is dissected, the rabbit, the dog, or the cat taken apart like any machine in order to ascertain the apparatus of its being; but what has been learned of the real secret, the mystery of a breathing, moving, sentient organism adapted to its own ends and environment, and filling its own place in creation? It has been truly said that "if modern knowledge is power, it is not wisdom"; and therefore, with increased education, the social status does not always improve, crime does not diminish, nor suffering grow less, and thus the levels of life are not lifted. And now that woman has taken into her own hands the shaping of her destiny, can she do better than accept these conditions? Can she conceive of no higher ideals, no grander incentive, and no more beautiful fulfilment? What is it that woman aims at in the widening of her career? Is it not freedom—the intellectual mastery and control that have made man free, and that she fondly hopes will give her freedom in turn? How shall she best attain it, she asks.

But right here, in the answer she gives herself, is actually the mistake that she makes, and that perhaps explains in part the hostile attitude of many men and the shrinking of certain women when equal claims and rights are asserted. Precisely by following in man's footsteps, she insists; along the lines he has chosen and with the same objects and ambitions in view. Just what he has accomplished, I will strive to accomplish. Just as he has built, I will build; just as he has aspired, I will aspire. But surely here is no freedom in its true sense, because no deliverance and enlargement of spirit, giving birth to new individuality and initiative. Un-

doubtedly there are women gifted to excel where men have excelled, in scientific and professional pursuits; but these women are necessarily exceptional. There are reasons deep-seated in her own constitution, and in the constitution of society, why it is not easy nor always to be advised that young women should be subjected to the mental strain and strict training required to fit them for a profession, nor is it well or often possible that girls as a rule should leave their homes and be sent into the world like boys. But even under the most favoring circumstances, and when good result has been accomplished without too great sacrifice or injury in any other direction, it is seldom that a woman is able to devote herself without interruption, and to the exclusion of the more intimate interests of life, to the callings that require unremitting and absorbed attention. Marriage comes in as so paramount a factor; an episode in the life of a man, it is a career for a woman, in most cases incompatible with any other career. And for women who do not marry, the claims and duties of home are often quite as pressing and incumbent; the family tie is stronger, the dependence more subtle, and the whole affectional side of life has greater stress and obligation with women than with men. But apart from these practical considerations, no woman who has sounded the depths of her own nature can help feeling that a profound deception awaits those who imagine that the outward extension of privilege, the liberty to enter the arena and compete for what the world prizes, will satisfy the deep inner craving, the vague but keen longing, the unknown want which the world cannot fulfil.

Women even more than men are restless, unsatisfied, seeking they know not what, they know not where; for a great hope has gone out of the world, a great light and presence once seen and felt by all. The world can not and need not go back to its primitive beliefs, but spiritual growth must keep pace with mental growth. In proportion as the realm of matter is explored and brought within the compass of mind the realm of spirit must expand to receive it, filling and making radiant with its presence the whole visible universe. The laws and harmonies of nature reveal still deeper harmony and all-embracing law; spiritual truth that reflects itself in man's inner consciousness in the workings of heart, brain, and soul. The mysteries of growth and evolution suggest untold possibilities, and lay the foundations of life and its finalities in ideal regions far beyond the range of physical sense. The finite loses its grasp and man becomes aware of his relations with the Infinite, of the constant inflowing of divine energies in his own being, and of eternal reality underneath the passing show of appearance. In the light of such understanding knowledge becomes wisdom, and higher education becomes the education of the higher nature. And it is women especially who have the key to this higher knowledge, in their finer perceptions and sensibilities, their more delicate organization so quick to discern the hidden sense of things, the meanings that flash out from the unseen and that are not apprehended by the intellect alone, but by the whole personality, which kindles with sympathetic response. This is the secret of that moral force which gives woman a strength beyond strength, faith beyond joy, and love beyond self. And this is truly woman's "sphere,"—her "vocation," whatever post she may fill,—to live within vision of the ideal, upon a

plane not bounded by the pleasures and pains of sense, and therefore to a certain extent released from the thralldom of material conditions. What higher mission and privilege for woman than to lead the example—to set the fashion, as it were, of nobler, purer, and simpler lives, consecrated to deeper and more unselfish purpose? Who can doubt that social ills would be remedied, and the pressure lifted? We should hear less of lives wasted by luxury and lives wasted by poverty, and civilization would cease to be a machine which threatens to crush out the soul of humanity.

Josephine Lazarus.

The Artist Maynard.

GEORGE WILLOUGHBY MAYNARD, the painter of "Daphne," the picture engraved for the frontispiece of this number of the magazine, was born at Washington, D. C., March 5, 1843. In 1866 he studied drawing and modeling under Henry K. Brown, and in 1867 became a pupil in the schools of the National Academy of Design at New York, and later studied under the painter Edwin White, with whom he went abroad in 1869. He felt himself especially drawn towards the works of the Dutch masters, and these he studied in Antwerp and other cities. In 1873 Maynard, in company with his friend the well-known artist and writer Francis D. Millet, went on a long journey through Transylvania, over the Carpathians, across Roumania, and down the Danube to the Black Sea and Odessa. From Odessa they went to Constantinople, Smyrna, Athens, and finally to Rome, where Maynard remained through the winter of 1873-74. He returned to New York, after an absence of five years, in the spring of 1874, and exhibited a picture ("The Angelus") for the first time at the National Academy in the spring of 1875. He has exhibited in the Academy every year since. In 1876 he made his first essay in decorative art as an assistant to John La Farge in the work in Trinity Church, Boston, and he has been closely identified with this branch of the fine arts ever since. His work in this field includes the figures on each side of the proscenium in the Metropolitan Opera House—"The Chorus" and "The Ballet"; a large part of the interior decoration of the Ponce de Leon Hotel at St. Augustine, Florida; parts of the entrance hall of the Boston Public Library, etc. Of easel pictures perhaps his most important work is the beautiful composition "Mermaids and Marines," that justly attracted great attention at the Academy exhibition of 1890; a water color called "The Sirens," exhibited in 1889; and genre works entitled "Old and Rare," "Strange Gods," and "The Bride." He has painted a number of portraits, those of William M. Evarts, C. C. Beaman, Chester Chapin, and Judge Addison Brown among the number. He is a member of the Society of American Artists, of the American Water Color Society, and a National Academician. His work is much esteemed by his fellow-artists, who recognize in it a true artistic aim and great ability in its expression; and his position in the social art world is shown by the fact that he is the president of the Salmagundi Club, and a member of the Tile, Players, and Century clubs.

BRIC-À-BRAC.

SOME BOYS.

BY JAMES WHITCOMB RILEY.

(IN presenting the child dialect upon an equal footing with the proper or more serious English, the conscientious author feels it neither his desire nor his province to offer excuse. Wholly simple and artless, nature's children oftentimes seem the more engaging for their very defects of speech and general deportment. We need worry very little for their futures, since the All-kind Mother has them in her keep. It is just and good to give the elegantly trained and educated child a welcome hearing. It is no less just and pleasant to admit his homely but wholesome-hearted little brother to our interest and love.—J. W. R.)

A Boy's Mother.

MY mother she's so good to me,
Ef I was good as I could be,
I could n't be as good — no, sir!
Can't *any* boy be good as her!

She loves me when I'm glad er mad;
She loves me when I'm good er bad;
An', what's a funniest thing, she says
She loves me when she punishes.

I don't like her to punish me:
That don't hurt, but it hurts to see
Her cryin'—nen I cry; an' nen
We both cry—an' be good again.

She loves me when she cuts and sews
My little cloak an' Sunday clothes;
An' when my Pa comes home to tea,
She loves him 'most as much as me.

She laughs an' tells him all I said,
An' grabs me up an' pats my head;
An' I hug *her*, an' hug my Pa,
An' love him purt' nigh much as Ma.

The Runaway.

WUNST I sassed my Pa, an' he
Won't stand that, an' punished me;
Nen when he was gone that day,
I slipped out an' runned away.

I tooked all my copper cents,
An' clumbed over our back fence
In the jimson-weeds 'at grewed
Ever'where all down the road.

Nen I got out there, an' nen
I runned some, an' runned again
When I met a man 'at led
A big cow 'at shooked her head.

I went down a long, long lane
Where was little pigs a-play'n';
An' a grea'-big pig went "*Booh!*"
An' jumped up an' skeered me, too.

Nen I scampered past: an' they
Was somebody hollered, "*Hey!*"
An' I ist looked ever'where,
An' they was nobody there!

I *want* to, but I'm 'fraid to try
To go back nen. . . . An' by an' by
Somepin' hurts my throat inside,
An' I want my Ma—an' cried.

Nen a grea'-big girl come through
Where's a gate, an' telled me who
Am I? an' ef I tell where
My home's at she'll take me there.

But I could n't ist but tell
 What 's my *name*; an' she says well;
 An' she tooked me up, an' says
 She know where I live, she guess.

Nen she telled me hug wite close
 Round her neck! An' off she goes
 Skippin' up the street! An' nen
 Purty soon I 'm home again!

An' my Ma, when she kissed me,
 Kissed the big girl too, an' *she*
 Kissed me — ef I p'omise shore
 I won't run away no more.

The Fishing Party.

WUNST we went a-fishin' — me
 An' my Pa an' Ma — all three,
 When they was a picnic, 'way
 Out to Hanch's Woods, one day.

An' they was a crick out there,
 Where the fishes is, an' where
 Little boys 't ain't big an' strong
 Better have their folks along!

My Pa he ist fished an' fished!
 An' my Ma she said she wished
 Me an' her was home; an' Pa
 Said he wished so worse 'n Ma.

Pa said ef you talk, er say
 Anythin', er sneeze, er play,
 Hain't no fish, alive er dead,
 Ever go' to bite, he said.

Purt' nigh dark in town when we
 Got back home; an' Ma, says she,
Now she 'll have a fish fer shore! —
 An' she buyed one at the store.

Nen, at supper, Pa he won't
 Eat no fish, an' says he don't
 Like 'em. An' he pounded me
 When I choked! — Ma, did n't he?

The Raggedy Man.

Oh, the Raggedy Man! He works fer Pa;
 An' he 's the gooddest man ever you saw!
 He comes to our house every day,
 An' waters the horses an' feeds 'em hay;
 An' he opens the shed — an' we all ist laugh
 When he drives out our little old wobble-ly calf!
 An' nen, ef our hired girl says he can,
 He milks the cow fer 'Lizabuth Ann.

Ain't he a' awful good Raggedy Man?
 Raggedy! Raggedy! Raggedy Man!

W'y, the Raggedy Man — he 's ist so good
 He splits the kindlin' an' chops the wood;
 An' nen he spades in our garden, too,
 An' does most things 'at boys can't do.
 He clumbed clean up in our big tree
 An' shooked a' apple down fer me!
 An' 'nother 'n', too, fer 'Lizabuth Ann!
 An' 'nother 'n', too, fer the Raggedy Man!

Ain't he a' awful kind Raggedy Man?
 Raggedy! Raggedy! Raggedy Man!

An' the Raggedy Man he knows most rhymes,
 An' tells 'em, ef I be good, sometimes —
 Knows 'bout Giunts, an' Griffuns, an' Elves,
 An' the Squidgicum-Squees 'at swallers theirselves!
 An', wite by the pump in our pasture-lot,
 He showed me the hole 'at the Wunks is got
 'At lives 'way deep in the ground, an' can
 Turn into me — er 'Lizabuth Ann!

Ain't he a funny old Raggedy Man?
 Raggedy! Raggedy! Raggedy Man!

The Raggedy Man — one time, when he
 Was makin' a little bow-n'-arry fer me,
 Says, "When *you* 're big like your Pa is,
 Air you go' to keep a fine store like his,
 An' be a rich merchant, an' wear fine clothes?
 Er what *air* you go' to be, goodness knows!"
 An' nen he laughed at 'Lizabuth Ann,
 An' I says, "'m go' to be a Raggedy Man —
 I 'm ist go' to be a nice Raggedy Man!"
 Raggedy! Raggedy! Raggedy Man!

Our Hired Girl.

OUR hired girl, she 's 'Lizabuth Ann ;
 An' she can cook best things to eat !
 She ist puts dough in our pie-pan,
 An' pours in somepin' 'at 's good an' sweet,
 An' nen she salts it all on top
 With cinnamon ; an' nen she 'll stop
 An' stoop, an' slide it, ist as slow,
 In th' old cook-stove, so 's 't won't slop
 An' git all spilled ; nen bakes it—so
 It 's custard-pie, first thing you know !
 An' nen she 'll say :
 " Clear out o' my way !
 They 's time fer work, an' time fer play.
 Take yer dough an' run, child, run ;
 Er I cain't git no cookin' done ! "

When our hired girl 'tends like she 's mad,
 An' says folks got to walk the chalk
 When *she* 's around, er wished they had !
 I play out on our porch, an' talk
 To th' Raggedy Man 'at mows our lawn ;
 An' he says "*Whew !*" an' nen leans on
 His old crook-scythe, an' blinks his eyes
 An' sniffs all round an' says, " I swawn !
 Ef my old nose don't tell me lies,
 It 'pears like I smell custard-pies ! "
 An' nen *he* 'll say :
 " " Clear out o' the way !
 They 's time fer work, an' time fer play.
 Take yer dough an' run, child, run ;
 Er *she* cain't git no cookin' done ! "

The Boy lives on our Farm.

THE Boy lives on our Farm, he 's not
 Afeard o' horses none !
 An' he can make 'em lope, er trot,
 Er rack, er pace, er run !
 Sometimes he drives two horses, when
 He comes to town an' brings
 A wagonful o' 'taters nen,
 An' roastin'-ears an' things.

Two horses is " a team," he says ;
 An' when you drive er hitch,
 The *right* un 's a "*near*"-horse, I guess,
 Er "*off*"—I don't know which.
 The Boy lives on our Farm, he told
 Me, too, 'at he can see,
 By lookin' at their teeth, how old
 A horse is, to a *t*!

I 'd be the gladdest boy alive
 Ef I knowed much as that,
 An' could stand up like him an' drive,
 An' ist push back my hat,
 Like he comes skallyhootin' through
 Our alley, with one arm
 A-wavin' fare-ye-well ! to you—
 The Boy lives on our Farm !

James Whitcomb Riley.

Charlie's Courting.

YOUNG Charlie O'Niel came to me one day,
And bashfully speaking he said:
"You are older and wiser than many I know,
And by your advice I 'll be led.
Now tell me how can I the question propose
To some pretty maiden I know?
I 'm anxious to marry, but cannot, because
The asking it puzzles me so."

I told him my thoughts, and urged him to try
The pleading a favor so sweet,
"For life without love 's like a field that is bare;
With love—like a field full of wheat."
When next I saw Charlie, so happy he seemed,
I asked him if love prospered so.
He laughingly answered, "The pleading 's so nice,
I've asked every girl that I know."

Mary Mathews Barnes.

On an Old Fashion Book.

How grim and sadly out of place you look,
Among these scions of a latter age;
How stout, though worn, your binding, too, Old Book;
How richly tint by Time each mellow page!
More than a hundred years you 've seen, all told,
Since bound in leather, and picked out with gold.

You fearlessly proclaimed, to Fashion's fair,
The rules which governed fast the toilet's charms—
The clinging skirts; the primly curling hair;
The waist that ended just beneath the arms,
And left these dainty damsels tall and slim,
For shortened waist adds much to length of limb.

"Sarcenet or crape" shall form my lady's gown,
"A girdle with a clasp" her zone be e'en;
Her "sleeves of love and lace striped up and down,
A bonnet Scots, and shoes of colored jean";
All this, and more, upon the yellowed page
We read, past-mistress of another age.

What wondrous tales of lords and ladies high,
Vignettes of dames, severe, and proud, and cold;
Her Grace of Bolton, with an eagle eye
And haughty mien, I 've pondered oft of old,
Wherefore was given—'t will never now be known—
Excess of nose and surplus collar-bone.

What woman's fancy shaped your course, Old Book,
From courtly England, far across the sea?
What hand of Fate did take you from your nook
In oaken hall or guarded library,
To bring you here, no doubt a welcome guest,
And rare, approved, consulted, and caressed?

How very grand you must have been,—not gay,—
For leather has a dignity its own;
And how your owner prized you, in her day,
When books were scarce, not so familiar grown
As in these times, with gilt and binding cheap,
And coverings of paper, not of sheep.

Yet here, in goodly company, you are,
With Emerson and Bryant, Keats and Poe,—
These children of our century, by far
Your juniors,—Whittier and Longfellow.
To-day—how fine, and grand, and gay they look;
And you—how worn and out of place, Old Book.

S. Elgar Benet.

Sweet Thievery.

My heart was like an empty case,
Where gems had never been.
It opened wide at sight of Grace,
Then safely locked her in.

There came, one moment evil-spelled,
A thief—Ah, lackaday! —
Who stole that heart, with all it held,
And took it clean away.

With gem and casket both to part,
How sad had been my lot,
But that the thief who got the heart
Was she the heart had got!

Dorothea Dimond.

Philosophy from the Quarters.

EF you doan't strike de stone hard enough you can't
spec' ter git de sparks.

WATERING de sand neber make it good soil.

DE early fish cotch de wum, but often de hook go
'long wid it.

Jus' foah de candle go out, it gibs de biggest light.

EF de watah am hot enough, de lettlest piece ob soap
ken make lots ob suds.

Isaac K. Friedman.

The Waning Muse.

"WHY art thou sad, Poeticus?" said I.
So blue was he I feared he would not speak.
"Alas! I 've lost my grip," was his reply.
"I 've writ but forty poems, sir, this week."

John Kendrick Bangs.

A Complaint.

I 'VE written many a thrilling tale
Which cruel editors reject;
My talents are of no avail,
I cannot write in dialect.

I polish up my verse and try
Each rhyme, each rhythm to perfect;
Alas! 't is all in vain, and why?
It is not done in dialect.

My teachers when I was a child
My education did neglect,
Their English pure and undefiled
Had not a trace of dialect.

I learned by Worcester's rules to speak,
And Lindley Murray to respect;
They taught me Hebrew, Latin, Greek,
But never thought of dialect.

Aspiring authors, hear my wail,
Success in letters don't expect,
Your finest efforts all will fail
Unless you know a dialect.

Louisa Trumbull Cogswell.

On a Becalmed Sleeping-Car.

THE snoring grows louder and deeper,
And this problem I meditate o'er:
If this is the snore of a sleeper,
Oh, what if the Sleeper should snore!

Meredith Nicholson.

A GALAXY OF FAMOUS PEOPLE

A PRETTY American girl recently called upon Mrs. Gladstone at her London home. She carried a most favorable letter of introduction as a member of a well-known American family. Her brightness and sparkle attracted the wife of the great English statesman, and for an entire afternoon and evening she lived in the Gladstone household. She confessed to Mrs. Gladstone that her visit had a purpose—that of writing an article on the home-life of her hostess for an American magazine.

"But, my dear," said Mrs. Gladstone, "your people are interested in Mr. Gladstone; they do not know me."

"That is just why I came," replied the girl, "in order that Americans may learn a little more of you."

MRS. GLADSTONE

At the tea-table, Mr. Gladstone joined with his wife in entertaining the American girl, and few were ever given a better opportunity of seeing the Gladstone home-life.

The quiet part which Mrs. Gladstone has played in the career of her famous husband is known to only a few.

While thousands of articles have been written of Mr. Gladstone, none of an authoritative character have been printed of his wife. Even her portrait is seldom seen in the English shops; rarely in the prints. She has always felt that public interest in her own country and across the sea was centred in her husband, and in order that his greatness might stand out more strikingly, she has each year further retired from public view. A freshness will, therefore, attach itself to the story "A Day with Mrs. Gladstone," as it will be told by her bright young visitor in THE LADIES' HOME JOURNAL during the coming year.

NO woman is, perhaps, more popular or so thoroughly beloved throughout Europe as is the Princess of Wales. By a uniform graciousness of manner, manifest on every occasion, she has endeared herself to almost every being in the kingdom. Her popularity exceeds even that of Queen Victoria. Wherever the Princess appears there is an assemblage. Her tastes in dress form the tastes of the English women. That she is a good dresser the whole world knows, combining style with a perfect knowledge of what is becoming in dress.

But it is in her domestic life that she has, perhaps, exerted the greatest influence. Her common sense in the training of her children has been the means of educating thousands of girls throughout Great Britain whose parents have followed the methods of their royal example. She taught her girls to cook, not from generalities, but by practical lessons in the kitchen, given one hour each morning. Then she took up with them the art of dressmaking, and London tailors concede that her suggestions—and now those of her daughters—are frequently superior in value to those of their own designers and fitters.

THE PRINCESS OF WALES

For years the Princess has had a close and intimate friend in a titled English lady, who, perhaps, has seen more of the domestic life of Marlborough House in all its phases than any other person. Upon state occasions, in drives and in walks, in private and in public, she has been the companion of the Princess, and it is no exaggeration, therefore, to say that this lady's article, "The Princess of Wales at Home," to be illustrated with private portraits and interior views in THE LADIES' HOME JOURNAL, will bear the stamp of authority and accurate knowledge.

IT is granted to but few women to be part of such an eventful life as has been that of the wife of Henry Ward Beecher. No man of this century had such a busy life, filled with so many honors

MRS. BEECHER

and achievements; and to view such a career through the eyes of his life-long companion is a pleasure rarely given to a public. Mr. Beecher was a lover of the domestic fireside. "My home is my temple," he once said, and in that home he gathered round him what his nature loved best: birds, flowers, and dainty bits of china and costly gems. If he was

great in public life, Mr. Beecher was greater in his home-life. In the one capacity he gave himself to the public; in the other he reserved himself for his family. In this latter light, he will be viewed by his widow in a notable series of reminiscient papers in *THE LADIES' HOME JOURNAL* during 1891. Mrs. Beecher will tell of "Mr. Beecher as I Knew Him," and thousands will gladly listen to her interesting story.

NEW YORK may at least fairly be said to rival the great drawing-rooms of Europe in its dazzling display of magnificent brilliants, for three-fifths of all the diamonds in the United States are owned in the city on the Hudson. There are

women in New York whose jewel-cases contain precious stones worth over half a million dollars. Some of the leaders of fashion possess gems that might arouse the envy of a queen, and so valuable that their equivalent in money would be sufficient to wipe out the whole of the present national debt. The jewels of the Astors, for example, represent a princely fortune, while those owned by Mrs. William K. Vanderbilt, Mrs. Hicks-Lord, Mrs. Bradley-Martin and the Belmonts are almost beyond value. The Empress Eugenie's necklace, the finest emerald in the world, one necklace valued at \$250,000—all these, and the contents of the finest jewel caskets of New York's fashionable women, are for the first time adequately described in print by Mr. Foster Coates's article in *THE LADIES' HOME JOURNAL* for November.

MRS. W. K. VANDERBILT

ONCE every summer Queen Victoria drives over from her Balmoral Castle to the Scottish Highlands home of Madame Albani-Gye, the famous prima-donna, where the latter entertains her at an informal tea. For years the Queen has made a practice of this, a compliment which her Majesty bestows upon no other woman in the kingdom. It is a return for Madame Albani's appearance each year at Court to sing before the Queen, and to the prima-donna it affords an exceptional glimpse of England's royal sovereign. "No outsiders are ever present," says Madame Albani; "and I see Victoria as a woman; never as a queen."

"How do you entertain your royal guest?" was asked of the prima-donna by a friend.

And for more than an hour the great singer held the uninterrupted interest of a private dinner-party with the story of how she served a tea for the Queen. So full of interest was the narrative that Madame Albani was induced to write out the account, and it will shortly appear in *THE LADIES' HOME JOURNAL* under the title of "Victoria at My Tea-Table." Of its freshness of the caption of the article is the best indication.

MADAME ALBANI

FIVE years ago a woman interested in the elevation of her sex and the spiritual improvement of young girls especially, conceived an organization which became known as "The King's Daughters." Success seemed to crown the idea almost from the start, and to-day Mrs. Margaret Bottome, the founder, is President of an Order numbering over 200,000 members. No modern charity is more interesting in its workings. Last winter Mrs. Bottome's "talks" in the most fashionable drawing-rooms of New York gave the "Order" a still greater prominence, while during the past summer Mrs. Frederick Vanderbilt opened her Newport palace to the meetings of a "circle" of which she is the leader. On October 1st Mrs. Bottome became one of the editors of *THE LADIES' HOME JOURNAL*, and in that periodical now writes and edits each month a special Department entirely devoted to her wonderful Order.

MRS. BOTTOME

THE royal thrones of Europe have held but few women who successfully essayed authorship.

While Victoria, of England, Margherite, of Italy, and other queens have dipped into literature,

THE QUEEN OF ROUMANIA

it has remained for the Queen of Roumania to achieve distinct literary success. Under the nom-de-plume of "Carmen Sylvia," she has proven her versatility as poet and fictionist, and her verses and stories have received the most universal praise from critics and editors. Her person-

ality is closely bound up into the lives of her subjects. She has mingled freely with her people, has studied their wants and won their love and reverence. And how observant can be an affectionate and considerate queen of her people, will be manifested in an article just completed by Her Majesty for THE LADIES' HOME JOURNAL, which, under the title of "The Women of My Realm," will throw out in striking contrast the lives of Roumanian women and their American sisters.

THE wife of a famous man will oftentimes be completely hidden by the dazzle of her husband's fame, and it is astonishing how little is known of those women whose husband's names are household words throughout the country. While the newspapers teem with the name of Thomas A. Edison, nothing is comparatively known or heard of Mrs. Edison. Every newspaper reader knows the

name of Chauncey M. Depew, but of Mrs. Depew only the most casual reference is made. Even in England, no one ever hears of Lady Tennyson. And the same is true of the wives of such men as P. T. Barnum, Will Carleton, John Wanamaker, Spurgeon, W. D. Howells, Dr. Talmage, Mark Twain, and James G. Blaine. Often these very wives have been the makers of their husband's careers. Their por-

MRS. DEPEW

traits are even less known than their lives. In a splendid series to be called "Unknown Wives of Well-known Men," THE LADIES' HOME JOURNAL will, during the year, sketch all these women and others, presenting their portraits, in many cases, for the first time to the public.

A QUIET New England neighborhood, with all that is most typical of American country home-life, affords a peculiarly adaptable atmosphere for such a writer of safe and pure fiction as Mrs. Adeline D. T. Whitney. With that dainty touch which savors of what is best and sweetest in fiction, Mrs. Whitney's pen never jars the pleasure

of her readers. Her stories are always elevating, and no parent has ever hesitated to place a story by Mrs. Whitney in the hands of his or her daughter. This is the key to the assured popularity of every story she writes, and her new serial story—"A Golden Gos-

MRS. A. D. T. WHITNEY

sip"—about to begin in THE LADIES' HOME JOURNAL, will have all the elements of Mrs. Whitney's popularity. It is, in the best sense, a beautiful story—the story of a woman who will draw thousands of women to her, while the capers and mistakes of a vivacious young girl give a sparkle to the novel which will appeal to every girl who reads it. The first chapter is as bright and strong as the last, every portion of the story indicating that it will prove one of Mrs. Whitney's very best pieces of fiction.

EDWARD BELLAMY'S literary success seems almost as strange as his wonderful book, "Looking Backward." In two years he has become one of the most widely-read authors of the day. When, fifteen years ago, he published his first stories through the Appletons, none would have prophesied that behind them was hidden a talent which was destined to hold the entire reading public of this country and Europe. It is the wide, public interest in his ideas and retrospective prophesies which will command a peculiarly ready audience for an article written by Mr. Bellamy, on "Looking Backward at Women," for THE LADIES' HOME JOURNAL. By many it will be regarded as a supplementary chapter to his famous book. To Nationalists it will have a peculiar value; to the great public at large it will have an interest which attaches itself to anything which Mr. Bellamy writes.

EDWARD BELLAMY

WHEN General Lew Wallace was United States Minister to Turkey, it was granted him to receive many courtesies at the hands of the Sultan. Desirous of attesting his appreciation of

royal kindnesses, he conceived the idea, during a visit to London, of buying a magnificent dog to present to His Majesty. The role of dog-fancier was a new one to the author of "Ben Hur," and with but scant knowledge of the canine tribe, he undertook the purchase. This experience General Wallace has just written out for the "Bright Things for Boys" Department of THE LADIES' HOME JOURNAL, and will make interesting reading for boys in connection with articles by P. T. Barnum, Oliver Optic, Robert J. Burdette, Horatio Alger, Jr., Hezekiah Butterworth, all of whom have written some of their brightest things for this page of the JOURNAL.

GEN. LEW WALLACE

To be the wife of a popular city pastor means the occupancy of a position for experience and observation afforded to a woman in no other sphere. It is she who sees the social side of her husband's church, knows even better than he the trials, the joys, the sorrows and the pleasures which enter into the daily lives of his parishioners. To her the world is truly a panorama, the scenes in which change each hour. Men and women alike are her confidantes, and of few women in similar positions is this more strikingly true than of Mrs. Lyman Abbott, the wife of the pastor of Plymouth Church, Brooklyn. Viewed from its historical greatness and present prosperity, no church in Brooklyn holds a more honorably

MRS. LYMAN ABBOTT

conspicuous position. To be a pastor's wife in such a parish means much; and it is this wide experience that makes Mrs. Abbott so sympathetic and valuable a friend to woman. And thus is she proving to thousands of women who, in THE LADIES' HOME JOURNAL, each month find "Aunt Patience's" Department of "Just Among Ourselves" a kindly reflection of that gentle sympathy and sweetness of spirit which has made Mrs. Abbott one of the most beloved women in Brooklyn.

WHEN an author can publish three successive books of short stories in a little over a year, and find that each only increases the

public demand for more, it is a convincing evidence of popularity. This success has come to Miss Sarah Orne Jewett's stories. Over the seas they have gone to be translated in other languages, widening a deserved reputation and a literary influence decidedly for the good. One of Miss Jewett's latest stories has been purchased by THE LADIES' HOME JOURNAL, and the December number has the first part. The story is distinctively Miss Jewett's—a New England tale, as graceful in its delineation of character as it is pleasing of plot. Miss Jewett's story is the leader of a series of short tales in the JOURNAL contributed by Mary E. Wilkins, Amelia E. Barr, Kate Tannatt Woods, Elizabeth B. Custer, Mary J. Holmes, Anne Sheldon Coombs, Rose Terry Cooke, and others of the most favorite of our short-story writers.

MISS SARAH ORNE JEWETT

In the belief that a story's interest is rendered two-fold by the addition of illustrations, the JOURNAL employs the best artistic skill obtainable in connection with each story which it publishes. The artistic side of the magazine is supplied by the best known and most talented artists—names which all lovers of the pictorial art in magazine literature will recognize: W. Hamilton Gibson, W. L. Taylor, Henry Sandham, Edmund H. Garrett, Frank T. Merrill, Frederick Dielman, C. D. Weldon, Alice Barber, W. St. John Harper, and others.

IT is as a test of the quality of its literature that THE LADIES' HOME JOURNAL has sought to put forth this briefly-told story of "A Galaxy of Famous People." It does not pride itself upon its ability to draw famous names to its pages, except in so far as those names mean a pure and healthful literature. This latter is its aim and object—to provide for the homes of America a magazine which can be read, by every member of the family, with pleasure and profit, and at a price which even the humblest can afford; and the management asks no greater favor of *The Century* readers than that, by the simple investment of 10 cents, they will purchase a copy of the Christmas JOURNAL (explained more at length on advertising page 97 of this number of *The Century*) and decide for themselves whether, in their own opinion, it is such a periodical as will justify their further investment of One Dollar for the year of 1891.

AUGUSTUS SAINT-GAUDENS, BY KENYON COX.

THE CENTURY MAGAZINE.

VOL. XLI.

JANUARY, 1891.

No. 3.

ALONG THE LOWER JAMES.

HE James, the principal river of Virginia, has its head waters four thousand feet above the sea level amid some of the wildest and grandest scenery of the Appalachian system.

Here ages ago, the scientists tell us, was a great water basin, a mighty cup about whose brim circled the everlasting hills, their awful stillness reflected in the crystalline, mirror-like surface of the lake. At last, still in a remote age, with resistless force it struck asunder the rocky wall and plunged southward through what is now known as the Great Gate, where the strata of rock, seemingly by some subterranean upheaval, have been thrown into almost perfect arches, between which the sparkling and limpid stream flows onward to the sea. Very beautiful it is, winding in and out through the Blue Ridge chain and its spurs, suggesting nothing of the terrible day of its wrath when the mountains were rent in twain and it became a river. The only record we have is that of the hills from whose clasp it broke away. When the English came and found that the Indians called the river Powhatan in honor of their chief, the settlers reproved the heathen by asserting the rights of his sacred majesty King James I., whose name it still bears, since we did not see fit to change it to Washington when we cut our leading-strings.

The country through which the navigable portion of the James pursues its tortuous course offers little or no scenery, according to the generally accepted meaning of the word, beyond the always agreeable combination of water and low banks fringed with willows and cypress trees—meadow lands and cultivated fields alternating with steep bluffs of marl and clay heavily wooded on top. The river is rarely clear, generally of a tawny red, often a dull orange

color, owing chiefly to the influx of the Rappahannock, which flows among the red hills of Albemarle and empties its turbid waters into the James some fifty miles above the city of Richmond, situated at the head of navigation. But it would be difficult to find in America a region of country of the same extent possessing greater historical and romantic interest than these counties of tide-water Virginia between which the James makes its way to the sea. Into this estuary more than two hundred and eighty years ago came the first successful English colonists. Along its shores dwelt, like nabobs amid their princely domains, the Cavalier planters, men who sought refuge in the new land of Virginia during troublous times at home, and whose stately old mansion-houses remain to us of the present day. Here, too, have marched the armies of two great wars, and battlefields are everywhere—cornfields and pastures they are now.

Richmond presents a fine appearance to the traveler as the steamer drifts slowly out into the stream just as the sun comes above the horizon. Along the slightly curving bank the city rises tier on tier upon the slopes of its seven hills, the loftiest eminence being crowned by the State capitol, made after Jefferson's model of the *Maison Carrée* at Nîmes, its façade with an imposing row of columns presented to the view. Down close to the water's edge are the great Haxall and Gallego flour mills, among the largest in the world, and farther up the river the Tredegar and Belle Isle ironworks, their chimneys belching forth volumes of flame and dark smoke. On the opposite bank is Manchester, situated upon a low-lying plain contrasting well with the varying elevations of the larger city, with which it is connected by some half-dozen bridges. Soon the spires and roofs become a misty bank against the western sky; then the Old Dominion's prosperous

seven-hilled city is lost to view, and the day's journey is well begun.

The steamer had journeyed on at a jog-trot, so to speak, about an hour, when a tall, gaunt man approached and seated himself in the chair beside me.

"I hain't be'n to these parts since sixty-fo'," he observed, tilting the chair and crossing his long legs, "an' then I set up thar on them steep banks an' had agers nigh about every day. You don't belong to these parts, I reckon?"

Not heeding the rising inflection in his voice, I uttered some platitude concerning the pleasant difference between those times and these. But it was not necessary for me to take any great part in the conversation. I soon discovered that my new acquaintance was a farmer from the Blue Ridge country.

THE PIGEON HOUSE AT SHIRLEY.

"Thar she is!" exclaimed he of the mountains, clutching me by the arm and dragging me across the deck. "Thar she is! I tell you we poured hot shot into them gunboats till they were glad enough to get back whar they come from."

The height to which he pointed was Drewry's Bluff, or Fort Darling, towering something less than a hundred feet above us. Along its crest the earthworks were outlined against the sky. How still and peaceful it had grown in all these years. From the slope of an embra-

sure where the blazing mouth of a cannon had once called a halt a little child looked down upon us as we journeyed on unchallenged.

"We poured hot shot into them gunboats," repeated the mountaineer reflectively, shifting a quid of tobacco from one side of his mouth to the other, "an' they did n't find gittin' along here so easy."

Another reminder of the war is Dutch Gap, a canal a few hundred feet in length, cut by Butler when ascending the river with his gunboats. For the practical purposes of navigation this canal is a great advantage, since it avoids a "horseshoe" of seven miles. Butler's fore-runner was a Dutchman, who in the dim days of the colony laid a wager with an Indian that he could beat him in a canoe race around the horseshoe, he, the Dutchman, starting a mile lower down the river. The Indian cheerfully accepted the bet and started off. When the Dutchman reached the narrowest point across the little peninsula he shouldered his canoe, walked over with it, and relaunched it on the other side, where he lighted his pipe and quietly awaited the arrival of the Indian. Hence the name of Dutch Gap. Upon the bit of land now converted into an island Sir Thomas Dale in 1612 laid out three streets defended by palisades and watch-towers. Being of a sanguine disposition and loyal withal, he called the place the City of Henricus, in honor of Henry, Prince of Wales. A few years later a "university" was established here. No vestige remains; city, palisades, university—all are vanished utterly. At Varina,—the Aiken's Landing of our civil war,—a short distance from the City of Henricus, Pocahontas passed several years of her brief married life.

The manor-house of Shirley may be taken as a typical house of the James River planter of the middle colonial period. Square, built of bricks alternately glazed and dull, two stories and a half in height, with steep roof set with dormer windows, the walls of the foundation from three to four feet in thickness, it is an edifice massive and simple in plan. Indeed, the builders of these old Virginia country-seats seem to have aimed at massive simplicity rather than at architectural display. And how much better it is, for the stately old piles yet retain their olden dignity, wearing well the years as they come upon them.

The eastern and western porticos of Shirley, with their Ionic columns, are of more recent erection, though they do not mar the original plan, with which, however, the quaint north porch more strictly accords. In the English models followed by the early builders in Virginia broad stone steps led up to the doorways, and while at some houses, as at Weston, these

remain, porticos and verandas have been generally substituted—an exigency of a warmer climate afterward recognized.

Everything here seems to have been constructed with a view to durability. The various outhouses, almost any one of which would make a commodious dwelling, are of brick, thick-walled and arranged in a hollow square, as though they might have been designed to serve the purposes of defense did emergency demand. Even the dovecote, a peak-roofed turret set upon the ground, is of brick. Within, the mansion corresponds to its exterior. The interior arrangement differs materially from that of other mansions of the period, the lower floor being divided into four unequal parts, all wainscoted to the ceiling, the largest of which serves as hall, from which an ornate stairway leads with two rectangular turns to the floor above.

The galleries of Shirley are rich in family portraits—the Carters and the families with whom they have intermarried, the Wickhams, the Byrds of Westover, the Randolphs, and others, from the first Virginia generation to the present. There are many Saint-Mémins among them—crayon portraits in profile against a soft pink background. How exquisitely regular of feature were these old belles and beaux of Saint-Mémin's time! One of the chief treasures of the gallery is Charles

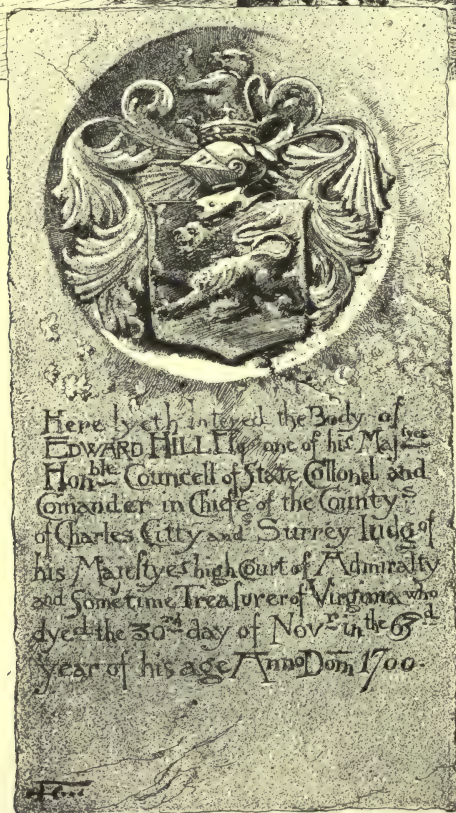

SHIRLEY FROM THE GARDEN.

Willson Peale's full-length portrait of Washington, a figure of the most unheroic rotundity standing out against the smoke and tumult of a battle-scene. There is also a portrait of the founder of the house, a handsome man clad in crimson velvet, lace, and a flowing peruke. Beneath a massive tomb emblazoned with the family arms he sleeps in the neighboring

THE DRAWING-ROOM, SHIRLEY.

TOMB OF EDWARD HILL, THE FOUNDER OF SHIRLEY.

graveyard. He was one "Edward Hill, Esq., Collonel and Comander in Chiefe of the Countys of Charles City and Surrey." His granddaughter, a blond beauty in blue among the family portraits, married into the Carter family, who are still the proprietors of the estate. If

the family tradition of the building of the house is correct, Shirley must long antedate the other James River mansions, since Edward Hill "dyed the 30th day of Novr in the 63d year of his age Anno Dom 1700." Certainly it is full of Old World suggestions, with its fine sweep of lawn, its prim box-hedged garden, its stout brick barns and other farm-buildings, the hatchments above the doorways, even the habits and manners of its occupants — a bit of England such as one does not often find in America.

Across the river, at the conjunction of the Appomattox, is the little village of City Point, the port of Petersburg, in which there is one attractive spot, a low, rambling frame structure situated amid picturesque grounds on the summit of the almost perpendicular bluff below which the two rivers come together. It was used for a time as headquarters by General Grant, and the weather-boarding in many places is riddled with bullets — cards left by passing visitors during the late unpleasantness.

Near City Point once stood the mansion-house of Cawsons, the birthplace of John Randolph of Roanoke. The Blands, Randolphs, and Bollings were at one time possessed of vast estates along the James and the Appomattox; and even now Turkey Island, Curles, Wilton, Cobbs, Matoax, etc., are indissolubly associated with their names, though for the most part passed into other hands and the dwellings destroyed.

The patent of Westover, one of the finest and best known plantations in this region, was granted to the Pawlet family and sold by Sir John Pawlet in 1665 to Theodorick Bland, the founder of the Bland family in Virginia. He is buried here, and his tomb and armorial bearings may still be seen. From the Blands it passed to the Byrds by purchase; and with the name of the second Colonel William Byrd, one of the most conspicuous figures in the story of colonial Virginia, who was born to a fortune amounting to a principality, as his tombstone proudly records, it is now invariably connected. From the river it presents a fine and prosperous appearance, its stately red brick front looking out upon a broad, closely trimmed lawn stretching down to the river. An avenue of superb tulip trees borders the gravel walk running the entire length of the grounds, at each end of which are elaborate gates of hammered iron with the arms of the Byrd family curiously inwrought. There is yet a third gate, above which perch leaden eagles with outstretched wings, larger and more elaborate in decoration, and capable of admitting the most ponderous chariot. Everything else is on the same lordly scale: even the bricked and flag-paved drain, the mouth of which, now partly choked up, opens from the bank upon the river shore. A man of average height may enter standing; and hence has arisen the tradition that the drain was a subterranean passage for escape from the house in time of danger, the curious stairway let into the wall of the house and the dry-well some twenty feet in depth, flanked at the bottom by two tiny rooms, adding to the mysterious charm of the tradition. The present proprietor is one of the most successful planters in the State, and by him the mansion has been restored to much of its pristine dignity. What fine old days it must have seen in the time of the jovial fox-hunting gentry, the descendants of those old Cavaliers who proclaimed Charles II. King of Virginia while still an exile from the British throne! And had the king taken them

at their word and appeared in person how speedily these same old Cavaliers, so restive under the slightest infringement of their rights, yet ever "his Majesty's most dutiful, affectionate, and obedient subjects," would have repented of their bargain and felt no hesitation about telling him so. One can almost fancy he sees the quaint iron gates swing open as the cavalcade rides in, sees the gentle dames and squires returning from the chase, hears their hunting-horns and merry shouts. But it is only the whistle of the steamer, and her captain and the present owner of Westover exchanging parting salutes. Ah me!

The Harrisons are represented among other estates by Berkeley on the north side of the river, and Brandon and Upper Brandon on the south. The first, erected in 1725, was the seat of Benjamin Harrison, a signer of the Declaration of Independence, and is the birthplace of the first President Harrison. To Virginians

THE NORTH PORCH, SHIRLEY.

Harrison and Brandon are almost synonymous; hospitality and Brandon certainly are, in the good old Anglo-Saxon acceptance of the word, notwithstanding the changes wrought by time and war.

Upper Brandon, now owned by Mr. George Byrd of New York, though still occupied by a representative of the original family, was formerly a magnificent establishment, but has never fully recovered from the shock and ravages of war. There is here a beautiful three-quarters length portrait of Martha

Blount,¹ Pope's sweetheart, done by Sir Godfrey Kneller and brought from England by Colonel Byrd of Westover. Clad in a robe of soft yellow satin cut low on the bosom, she sits before a harpsichord and holds a sheet of music in her hand. Ah, beautiful tyrant, when I look into your deep brown eyes and note the turn of your head with its wealth of chestnut curls, and the pouting, half-petulant, voluptuous fullness of your nether lip, I do not wonder that the poet permitted you to lead him such a dance. Here, nearly two centuries after your beauty has crumbled and I look upon your pictured loveliness, I am almost willing to assert that I, too, would have been as abject a subject, notwithstanding your notorious habit of indulging yourself in a bad quarter of an

THE BRANDON PLATE.

hour: I say quarter of an hour, madam, out of deference to your sex—and your beauty.

Brandon, a veritable English country-house encompassed by broad lawns, shadowed by noble trees, among which are the magnolias and mimosas of the South, has remained in

the Harrison family since its foundation, about a hundred and fifty years ago. Here, too, linger many traces of the war. The blinds and other exterior woodwork are defaced by bullets, and entire panels of the wainscoting of the interior have been torn away. In this connection it may be interesting to quote from a private letter written by the present mistress of Brandon, a daughter of the distinguished editor Thomas Ritchie.

"Our hall windows," she writes, "were real chronicles of the past. Mr. J. K. Paulding, of literary fame, was the first who enrolled his name with a diamond upon one of the old panes years ago. In his 'Letters from the South' you will find an interesting sketch of his visit to this old place. Year after year his example was followed by numbers of dear friends, and many panes of the four old windows had long lists of the happy spirits who had flitted around so joyously and have now passed away forever. Mr. John R. Thompson, one of our Virginia poets, who visited us, was so struck with these old records of the past that he wrote some touchingly beautiful lines on them. You may imagine our grief, on returning home after the war, to find all our historic panes shattered and our house a skeleton home—fifty windows gone and fourteen doors. But we were so grateful that we had a roof over our heads. The birds had built their nests in the hall; the foxes came up to the steps even after our return; and the squirrels were masters of our lawns, where they are still gamboling, leaving us but few nuts and pears. But they are real pets with the family, and are not disturbed."

Despite all changes Brandon continues a most charming spot, where the aroma of the old time still hovers and hospitality has never become a tradition. The house consists of a main building two stories in height, flanked by spacious drawing and dining rooms, beyond which are broad corridors connecting with capacious wings. It is indeed a picturesque old pile, softened by the innumerable neutral tints of time and partly enveloped in ivy, in many places several feet in thickness. The western wing is entirely covered with this vine, the windows looking out through a mass of perpetual green, the apartments within appearing from the outside more like arbors than like the chambers of a dwelling. Standing in the lofty, square hall facing the northern entrance, you look out across the lawn down a narrow vista, cut through a tangled wilderness of rose trees and boxwood hedges, at the end of which is a glimpse of the river and the opposite shore. Then turning towards the southern entrance you look along another vista through the park out to the open country beyond, where the road

¹ The present owner of this portrait has recently come to believe, from external evidence, that it represents Teresa and not Martha Blount. Tradition has always held it to be the latter.

BRANDON.

passes between glistening fields of corn. Thus by turning on one's heel is commanded an unobstructed view of more than five miles—not imposing, it is true, but most pleasing to the eye. There is no better proof of the hospitality reigning within the establishment than the spirit which prompts the opening of these extensive grounds in the long, hot days of summer to parties of excursionists from the neighboring cities, many of whom would otherwise be denied a breath of the pure country air. "One cannot refuse to others a blessing the value of which one so truly appreciates and is so thankful for." Is not this a beautiful hospitality, so disregardful of personal inconvenience or annoyance? Then, too, some specially favored guest may pass through the hall to the stately old drawing-room and there receive the ceremonious, but most gracious, greeting of the mistress of the house, upon whose head the snows of years rest more like a benediction than the mark of speeding time.

The art treasures of Brandon are numerous and valuable, consisting not only of the Harrison family portraits but of those of the Byrds of Westover and many others of distinguished men and women collected in England by the second Colonel William Byrd. Conspicuous among these is one of Colonel Byrd himself, done by the brush of Sir Godfrey Kneller. The face looking from the flowing brown curls is as beautiful as that of a woman; and it is

difficult to realize that it lived to wear the wrinkles of threescore years and ten, and finally went to dust nearly a century and a half ago. Colonel Byrd filled many positions of trust in the colony, founded the city of Richmond, and was one of the Virginia commissioners who superintended the running of the dividing line between Virginia and North Carolina. Of this expedition he wrote a lively and delightfully witty account—the famous "Westover Manuscripts"—the original of which is preserved at Brandon. He was educated in England under the particular care of Sir Robert Southwell; and afterwards went there as agent of the colony to the court, becoming known among his familiars as the Black Swan. Thus among his personal friends were numbered many of the nobility and other distinguished men of the time; and in the dining-hall at Brandon hang the portraits of some of them, emphasizing the Old World effect of the wainscoted walls and the massive dark mahogany furniture. Among these are

THE DINING-ROOM, BRANDON.

represented Sir Robert Southwell; Charles Montagu, Earl of Halifax; Sir Charles Wager, First Lord of the Admiralty; John, second Duke of Argyle, in steel corselet and cloak of crimson velvet; Sir Wilfred Lawson; the Earls of Albemarle, Orrery, and Egremont; and Robert Walpole, Earl of Orford.

From above the door leading into the corridor a personage of a thin, keen visage surmounted by a cocked hat surveys this august assemblage in their full-bottomed wigs, laces, and gorgeous velvets. He is one Mr. Waltho, for many years clerk of the Virginia House of Burgesses. This portrait of himself he presented, along with a handsome diamond ring, to Colonel Byrd, requesting that it should be hung among the peers, for whom he might show his republican contempt by wearing his hat in their presence. The gifts were accepted, and the portrait was placed above the door, in token that the clerk of the House of Burgesses finds the company too good for his keeping and is in the act of leaving. When, through an intermarriage, this, among other pictures, was transferred from Westover, the conceit of the aristocratic Virginian was not disregarded; and Mr. Waltho's diamond ring sparkles upon the hand of the lady of Brandon.

Another exquisite work of art, the painter of which was Sir Godfrey Kneller, is a portrait of Daniel Parke, governor of the island of Antigua, who, through his daughter's marriage with a

Custis of Arlington, became the progenitor of the first husband of Martha Washington and of Mrs. Robert E. Lee. A Virginian by birth, he went to England, entered Parliament, from which he was expelled, and then became an aid-de-camp to Marlborough. After Blenheim he bore a hasty note from the great duke to his redoubtable duchess, and the queen presented him with her own miniature framed in diamonds. This he wore on his breast when he sat for his portrait, and there it shines at the present day, while the smoke of Blenheim ascends, a dense column in the background. As governor of Antigua he proved a tyrant, and the inhabitants mobbed and murdered him. One of his daughters became the wife of Colonel Byrd, and thus this beautiful picture finds a place in the Brandon gallery. These portraits hang in the dining-room, where there is much else of interest in the way of old family plate, and the quaint communion service of Brandon church, bearing the date of 1659. Other portraits hang in the halls and drawing-room.

Passing by the work of West, the elder Peale, and other distinguished American artists, there yet remain three portraits demanding special attention, on account both of the painters and of their subjects. The first of these is of Anne Randolph of Wilton, the first Mrs. Benjamin Harrison of Brandon, done by Sir Thomas Lawrence. The second is of Eliza-

beth, Lady Claypole, Cromwell's daughter. Sir Peter Lely was the artist, and the woman he painted in her pale blue draperies, leaning upon her bare bended arm, was a beauty. The picture is therefore priceless.

The third portrait is of a beautiful girl who came into the world nearly two centuries ago and dwelt but a little while. She was Mistress Evelyn Byrd, daughter of that Colonel William already so often mentioned. One loves to look at her seated there upon a bank of green-sward — amid the shadows of gathering dusk, the fading light yet aglow upon her pale blue gown, and the handful of gathered roses and the shepherd's crook lying across her lap; still illuminating the dark almond-shaped eyes and kissing the full, bare throat and bosom. Among the branches overhead perches a brilliant red-bird, doubtless a play upon the name

tinguish the vine-covered ruin of a square brick tower standing amid a grove of trees. This, with a few broken gravestones heavily carved with armorial bearings, is all that remains of the first successful English colony in America. Along the beach lie the remnants of undermined foundations, over which the tide ebbs and flows; and at the present rate of encroachment it must be a matter of only a few years before the waters will lick up the very dust of the dead. The island is gaining at the lower end; but this seems small compensation for the destruction of its most historic part, the preservation of which demands prompt action and a well-filled purse. But they should not be demanded in vain. One cannot look without emotion upon this island and think of the scenes that have been enacted here, of the men and women who lived out their lives within its nar-

THE OLD MAGAZINE AT JAMESTOWN.

of the satin-clad shepherdess whose sheep have wandered away out of sight over the brow of the hill. Sir Godfrey Kneller must have been proud of this picture, as he was of that of Beatrix Esmond, beneath which Madame Bernstein sat and meditated grimly in after years. But there is no such pitiful tale to tell of the fair young Virginian, the *Rara Avis* as she was called at the court of George I. She was beloved by the Earl of Peterborough, but her father opposed the marriage on account of differences in religious belief, and she died young. Tradition says that her heart was broken. Across the river she lies in the graveyard at Westover, and a massive monument with the family escutcheon tells her "name and life's brief date."

Jamestown is but a low-lying island that seems scarcely to rise above the water's edge. With the aid of the glasses one can easily dis-

row circumference and laid the cornerstone of our great republic. The place is haunted. Here Captain John Smith, Admiral of New England and doughty slayer of Turks, one of the most picturesque figures in our colonial story, flourished as the hero of many romantic adventures. In this very church, whose crumbling belfry alone lingers from the past, Pocahontas, the lithe-limbed Indian princess, if you can accept tradition, stood beside the font and was transformed into Rebecca, a Christian woman. Here, too, she plighted her troth to John Rolfe, Gent. Ah, that same John Smith, with his furious mustachios and sword and breastplate, as we all see him in his portraits, was a gay deceiver every inch of him, at least to lovers of the romantic. How much more pleasant it is to think of Pocahontas stealing through the woods at night to give warning of a proposed attack by her father's braves than

THE OLD CHURCH AT JAMESTOWN.

at Jamestown, where I have seen the remaining fragment of her tomb, upon which, by the way, are the Ludwell arms—a grim posthumous retaliation.

Near the grave of Lady Berkeley is a handsome chest-shaped tomb, through some crevice of which a sycamore has forced its way and grown into a large tree, wrenching the slab from its place and breaking it into fragments, some of which yet remain partly embedded in the trunk, and upon these we may read in mutilated sentences the epitaph of

Sarah Blair, wife of Commissary James Blair, who founded William and Mary College at Williamsburg in 1693, seven miles in-

IN THE GRAVEYARD.

of Rebecca Rolfe homesick at the English court. There is something very touching and desolate about that grave on the other side of the sea at Gravesend, where she sickened and died and went to dust. "She came to Gravesend, to her end and grave," as the quaint old chronicler has put it.

Other shapes haunt this island of Jamestown. Here Sir William Berkeley lived for thirty years as royal governor, thanking God that there were no printing presses in America, and hanging more men for participating in Bacon's Rebellion—the revolution one hundred years ahead of schedule time—than Charles II. put to death for the execution of his father. When he died his widow married Philip Ludwell, secretary of the council, reserving the privilege of retaining the title of Lady Berkeley. Being possessed of a neat property,—some thousands of acres, probably,—she was enabled to make her own terms. She is buried

land, Sir Francis Nicholson's "new citie" two centuries ago, the capital of the colony in its palmiest days, and the first capital of the commonwealth.

Of the original Jamestown this is all that remains. Fields of waving grain and pastures dotted with browsing cattle encompass the moldering church-tower and graveyard, beyond which stands an old colonial mansion, now filled with the life and interest of the nineteenth century, but keeping the old-time spirit of hospitality as well.

The last of the old mansions visible from the river as you draw near the bay is The Grove, a seat of the Burwell family, built about 1746 after the prevailing colonial pattern by "King" Carter of Corotoman, whose daughter married a Burwell. Situated upon an elevation a quarter of a mile back from the river, the grounds sloping in terraces to the level of the bluff which here bounds the beach below, the old

house with its pyramidal roof and flanking "offices" stands out clearly against a background of noble trees, and commands an unobstructed water view twenty miles in extent. It is noted for the beautiful and elaborate carving of the woodwork of the interior, some of which has fortunately escaped the painter's brush, the wainscot now become mellow in tint, a dark richness that age alone can impart. An interesting memorial of the Revolution is the mahogany balustrade along the stairway hacked by sabers—the cipher signature of Lieutenant-Colonel Tarleton and his raiders.

Now for a word as to the material condition and prospects of this country of the lower James, teeming with the traditions of past wealth and a romantic social history. Naturally, reared in such an atmosphere, it has taken a long time for the people to recover from the shock consequent upon the result of the war, and many have not yet done so. But all along the line there is an ever-growing realization of the power of well-directed personal exertion which is slowly but steadily producing good results. The fine old manor-houses of the nabob planters, though far removed from their pristine grandeur, have been raised in many instances from a state of semi-ruin to become once more the homes of comfort, if not of opulence; and there is good reason to believe that this process of improvement, slow though it may be, will ultimately restore much that has not already been regained.

The old order changeth, yielding place to new,
And God fulfils himself in many ways.

Men's souls have been severely tried; but the blood of the old colonists, infused with

new life, has risen to meet the emergency; for after all it is the maker of the old South and his descendants who are the moving spirits of the new South, though their energies may be bent in other directions. Though still most tenderly cherishing the past as a precious legacy, they realize and act according to the demands of the present, with the reasonable hope of reaping in the future a generous harvest. Westover—no longer, it is true, in the hands of its quondam proprietors—once more wears the front of prosperity; the broad acres of Shirley and the two Brandons as I saw them in the full blossom of June were smiling with luxuriant crops; and so it is, in greater or less degree, with other estates. Clairmont, the seat of a flourishing agricultural and manufacturing colony, is now the deep-water terminus of a railroad which has opened up a large tract of back country hitherto difficult of access. Hog Island, so called on account of the large droves of wild hogs found there by the early settlers at Jamestown when starvation stared them in the face, has been converted into a model cattle farm with all the modern improvements.

As the steamer leaves Newport News, a city in embryo, the eastern terminus of a great railroad system, and plows her way through Hampton Roads, where the *Monitor* and the *Merri-mac* fought each other, the broad land-locked water scene is very fine, the Roads meeting the Chesapeake, and the ocean peeping in between the distant pale-blue capes. Norfolk, Portsmouth, and Hampton are faintly visible at different points of the horizon; and also Fort Monroe, with its grass-bordered rampart crowning the tip of the peninsula, while the Hygeia Hotel, as if basking under its protection, stretches its length along the beach below.

Charles Washington Coleman.

KENYON COX.

IT seems as if there could be little in the atmosphere of a prim New England village or of a busy Western town to incite a youth to the serious study of art; nevertheless, many of the best of our painters have come from so uncongenial a

place. The fact is that the country boy who finds himself possessed of the desire to become an artist has no exact knowledge of what an artist's life is like, and but a confused notion of the aims of art. He forms an ideal, and after trying to realize it with the limited means near at hand ends sooner or later by striking

out boldly for the best place in the world. It is certain, moreover, that the ablest men we have, with very few exceptions, are those who have cut away from home life and have had their artistic taste cultivated and their brains trained to work in the best foreign schools. Kenyon Cox is one of these.

He was born at Warren, Ohio, on the twenty-seventh day of October, 1856. His father is General Jacob D. Cox, whose career as a soldier in the civil war, as governor of Ohio, and as a man in public life is too well known to need to be referred to here in detail. What is perhaps less generally known is that he is a man of high scientific attainments whose name is familiar to the learned world of Europe and America as a distinguished microscopist. He

FLYING SHADOWS.

is now president of the University of Cincinnati. Mr. Cox's mother is the daughter of the late President Finney of Oberlin College. His father's family are New Yorkers, and give Hanover as the place whence they came to America years ago. When a small boy Cox saw some pictures in Warren by an artist named Crawford which fired his youthful imagination, and he announced his firm intention to become a painter. His family received this declaration—as well-regulated American families usually do—with depreciating smiles, but the boy was not yet able to show them that he meant what he said. From the time he was nine years old until he was thirteen he spent most of his life in bed, and underwent two critical operations.

Having lived through this most painful period he slowly gained strength, and after that went to school when he could go; but that was not very often. In a year's time he was allowed to enter the McMicken Art School in Cincinnati, where he remained about three years, though he passed more of his time sketching animals at John Robinson's menagerie than he did in the class-rooms. Three more years he spent in a desultory way with

some drawing and much reading, "receiving an early and healthful introduction to Shakespeare," and in 1876 he went to Philadelphia, becoming a pupil at the Pennsylvania Academy of Fine Arts. Cox began to feel the truth of the maxim that "Art is long," but he did not see how to help himself much in Philadelphia, and in the autumn of 1877 sailed for Paris. He worked first about a year in the atelier of Carolus Duran, but feeling that the men who studied there did not draw well enough to suit him, he entered the École des Beaux Arts and drew for a time from the antique under Cabanel. Later he again changed masters and was admitted to Gérôme's class; here he worked from the life about three years. In the afternoons when the ateliers in the government school were closed he painted at the Julian Academy, receiving criticisms from Bouguereau, Lefebvre, Boulanger, and other professors. Gérôme, however, he regards as his master, and as "élève de Gérôme" his name is printed in the Salon Catalogues of 1879, 1880, 1881, and 1882, in which years he exhibited "A Venetian Girl"; "Lady in Black" and "Among the Wild-flowers"; "White and Pink"; and "Portrait

of Mr. E. G." and "The Looking-glass Portrait of my Friend U——."

Cox took a studio in New York in the autumn of 1883, and his work has been well known in the current exhibitions of American art ever since. He received the second Hallgarten prize at the Academy exhibition of 1888, and represented at the Paris Exhibition of 1889 by four of his works in oil and by six drawings in black and white, he was awarded two medals of the third class. As a draftsman his illustrations for Rossetti's "The Blessed Damozel"—none of which, by the way, he was able to send to Paris—have given him a wide renown. In some of these designs, such as "Some of her New Friends," "The Stars sang in their Spheres," and "With Love," he has attained a very high level. The work the artist did in this series of drawings has had a strong influence on his painting, being of the serious sort that helps to progress, and not of that other sort, too frequent, unfortunately, in the illustrative work of painter-designers, which lowers their standard rather than elevates it.

Kenyon Cox is a colorist of distinction, but he is above all a draftsman; indeed he is one of the best draftsmen among American painters. In the autumn Academy exhibition of 1888 there was a small portrait of a lady by him that is a marvel of drawing, and which possesses a fineness of line that makes it comparable to the best work of *Élie Delaunay*. Better drawing is seldom seen nowadays than is to be found in this admirable little head in three-quarters view, and it is painted with extreme delicacy of touch. That it is entirely free from hardness in modeling is proof of its great excellence. In the portrait of *Augustus Saint-Gaudens*, exhibited at the Society of American Artists in 1888, Mr. Cox has had to deal with an exact problem in the representation of things as they are in nature, and he has given in this picture a brilliant exposition of his power as a technician. It is notable also as showing skill in the expression of character—a quality that marks every portrait which the world has decided to call good. "A Studio Corner" (a portrait of the artist *Will H. Low*), exhibited at the Academy in 1884, is, again, a worthy example of the painter's ability to transcribe facts while investing them with the quality that belongs to true picture-making. The list of portraits that Mr. Cox has painted is not a very long one, but it is marked by several performances that are extraordinarily good. Considering a portrait as it ought to be considered—as a work of art in itself as well as a likeness—we shall not find many canvases among those signed by American painters in recent years that equal Mr. Cox's "Portrait of Roger D——," in the Academy

exhibition of 1890. A little boy with a rosy face and blonde hair, dressed in a sailor suit of dark blue, is represented standing, with a background of quiet gray. There are no "accessories" in the picture; the composition is simplicity itself. But it has much of that charm which distinguishes the master's portraits, the charm that lies in giving us character and truth without meretricious effect.

No man in America has worked more persistently and conscientiously than Kenyon Cox to paint well for the sake of painting, and no man has striven more resolutely to realize his ideal in spite of that lack of encouragement which is measured in money. From indifference on the part of the public, from a criticism of his intentions which in some quarters has been as malicious as it is ignorant, Cox as a painter of the nude has had much to endure. Some of the best of his works, such as "Jacob Wrestling with the Angel" (Society of American Artists, 1888), have not attracted much more than a passing notice; others have been misunderstood and condemned. It is sufficient to say here that no painter among us has a purer sense of beauty in the ideal, and no one has a keener perception of grace of form and distinction of color in nature. He is impelled to paint the nude simply because he considers it beautiful. It would be a sorry day for art if the critic's right were admitted to dictate to the artist what he shall choose for the subject of his work, yet Mr. Cox has been told to leave off painting the nude and paint only those other things in which his intentions are fully understood and his ability universally recognized. It is characteristic of the man that he has turned a deaf ear to such admonitions, and it is gratifying to those who believe he is right to see that in a composition completed during the past autumn he has surpassed his previous work in this direction, and has produced in a picture called "Vision of Moonrise" a canvas of most admirable quality and so complete in drawing, color, and *ensemble* as to make it compare favorably with the best of modern work. It would be scarcely fair, however, to compare what he has done with the best work of the same kind by modern Frenchmen. He is much nearer the Italians of the Renaissance in his sympathies than he is to *Gervex*. He has more in common with *Baudry*, whose works he admires intensely; but he is most influenced by the great Venetians. *Titian* and *Giorgione* are his gods, and if he thinks of other men's work when he toils at his own it must be of these two. His standard is such a high one that he may never reach the point where he can say that he is satisfied with what he has done; but is it not a question whether any really good man ever did? And is it not

A STUDIO CORNER, BY KENYON COX.

the best hope for the future of his art when we find a painter saying, "I have yet something to learn"?

But Cox the painter of the nude is another man from the painter of such a landscape as "Flying Shadows." He holds, rightly, that an artist should not keep to one "line," and he thinks, rightly again, that the highest fields in painting are the portrait, the nude, and the landscape. In his portraits he is as modern as he well could be, meaning always that he has never been guilty of cultivating a "fad" or of sacrificing truth and simplicity for mere effect. As a landscape painter he is modern and a naturalist. He is always sober, self-contained, and reserved. "Flying Shadows" was painted when the artist returned fresh from the sympathetic atmosphere of France. He visited his native State in the summer of 1883, and the picture was painted on the banks of the Ohio near Bell-air. There is a force in feeling one's self amid scenes that have been familiar from childhood and receiving the impressions that associations produce, and in the picture in question there is no doubt but the painter was influenced by such a feeling. These rolling hills, with patches of woods and fields separated by rail fences, with alder bushes growing in the corners, are distinctively American. They belong in Ohio and western Pennsylvania, and nowhere in the world except in the upper Ohio Valley does the landscape bear just such characteristics as distinguish this picture. In its treatment there is no hint of the softer atmosphere of northern France, where the painter had lived and studied for five years before. In the well-modeled contours of the ground, in the clearly marked values of one mass of green beside the others, in the well-defined horizon with its bright sky and white clouds floating by, in every line of the composition, there is the accent of local truth. Such native motives as these Mr. Cox has used in his compositions of the nude; and in the "Vision of Moonrise," "Evening," "An Eclogue," and other pictures, their fitness for the purpose may be noted. In choosing these motives, too, it should be remarked, the painter has avoided the raggedly picturesque—the scraggy oak and the stringy birch tree, with which we are only too familiar. In his pictures are broad stretches of meadow, round, well-foliaged trees, and simple skies with cloud masses well drawn and in harmony of line with the land.

As a painter, whether of portraits, or the nude, or landscape, Kenyon Cox always impresses us as a man who is in earnest. His work is invariably sincere and dignified in intention; in many of his compositions there is a regard for style

that is such a rare quality in the work of American painters as to make it worthy of note when we find it. That which has been criticized most frequently in his pictures of the nude is the result of mistaken judgment of his public, not of perverted taste. He fancies that all the world can see from his point of view, forgetting that the artist from the hour he begins to study gets farther and farther away from the standpoint of the layman, who has generally remained almost in the same place. Feeling sure that he is right himself, he is tenacious of his opinion, and rarely makes a change in his work at the suggestion of others; or if he does, he often changes it back again, convinced that he was right in the first place. Self-reliant and persistent, he reasons clearly and logically, and acts upon his conclusion. High-minded and absorbed in his own world, he takes little heed of the concerns of others except when he is appealed to, and then he is always ready and willing to give to his friends the same conscientious thought and the same energetic action that he brings to his own affairs. Though his health is none too robust, and his life has been in part a struggle to regain the strength the illness of his boyhood came near depriving him of altogether, he has energy of intellect sufficient for a whole company. Alert, keen, and responsive, he finds an interest in many things outside of his art. A writer of correct and vigorous English and a regular contributor to some of our best periodicals and journals, an active working member of the Society of American Artists and one of its Board of Control, the indefatigable secretary of the National Free Art League, a hard-working committeeman, one of the ablest instructors in the Art Students' League, a busy illustrator, and a painter who works in his studio with the ardor of an enthusiast, there is no more individual figure in the art world of New York than Kenyon Cox. He believes thoroughly in the future of American art and thinks the best hope for its high rank lies at home. He maintains that its ultimate supremacy is inevitable, and to do what he can to hasten the day when it shall be acknowledged second to none is his constant thought. He is always ready with hand and voice and pen whenever and wherever he feels he can help to advance the cause of true art among us, and when he enlists he fights manfully to the end. No one's interest is greater and no one's industry is so unflagging in every movement which tends to achieve that higher civilization which comes to a people after the height of material progress is attained, and no good cause need more than once appeal to the artist or the citizen Kenyon Cox.

William A. Coffin.

AN IRISH GENTLEWOMAN IN THE FAMINE TIME.

THE great Irish famine—alas for the country which need distinguish its famines—had some beneficent consequences, but among them cannot be reckoned the one conse-

quence most widely and hopefully predicted at the time—the famine did not draw Irish and English hearts together. On the contrary, it added a burning memory to the old grudges. Ever since then the Celt has held his English landlords responsible for the famine's coming, and the English Government responsible for its horrors. Your Irish orator will picture, with savage eloquence, the loaded cars crawling past the dead faces that stared out of the mud, as the grain of starving Ireland was carried away to pay her absentee landlords' rents. Listen to him and you have, on one side, the Irish victims, robbed for centuries until they were the poorest people on earth, and on the other, cynical English oppressors who did not let the wretches all starve because corpses cannot pay rent, but doled out their help as a loan, under intolerable conditions. It is an appalling indictment. But if one turn to the acts of Parliament passed for Irish relief; if he read carefully the narratives of such dispassionate observers as Pim and Mann, and such fair-minded Government officials as Trevelyan, or the reports of the British Relief Association; if he glance down those enormous lists of subscriptions, headed by the Queen, published by the British Relief Association and the Committee of Friends;¹ especially if he read in the newspapers of the day, and in yellow old letters, the affecting details of individual sacrifice and benevolence—he will be amazed at the English munificence, and cannot resist admiring, as well, the courage and sagacity displayed by the English Government in its grapple with Death. For a year and a half, from a third to half of the population of Ireland was supported by charity. During the month of July, 1847, 3,020,712 persons received daily rations of food from the Government.² "Advances

amounting to nearly two millions³ were made by Parliament. Local and central relief associations distributed sums which could not have fallen far short of a million and a half."⁴ Yet trade was not paralyzed thereby. Neither did this colossal almsgiving pauperize the country. To use the language of one of the ablest and most candid of the Government officials:

The multitude was gradually and peacefully thrown on its own resources at the season of harvest, when new and abundant supplies of food became available, and the demand for labor was at its highest amount.⁵

That such exertions should have elicited so little gratitude may be sorrowful, but it is not strange. Ireland has always depended upon the richer country's help. Whatever the emergency, landlords and patriots have always been agreed upon one point, to expect aid from the central government; I may say that they have been agreed upon another, to be dissatisfied with the aid given. Naturally they expected aid during the famine, and, in a measure, looked upon such aid as their right—which is not a frame of mind conducive to gratitude. I am not discussing now the claims that the English colony certainly had on England, nor the greater claims of the people subjugated cruelly in the first place, impoverished later, by villainous trade laws; I am only calling attention to a fact as the partial explanation of another fact. Besides, the machinery necessary to support half the population could not be invented and got into working order quickly—and men were dying every hour! It is asking too much of human nature to expect the ragged, ignorant, half-crazed survivors of that awful time to be grateful because only two or three out of a family starved to death. More than all, perhaps, the methods of relief—methods of grim necessity, very likely—were most repugnant to the Celtic temperament. Memories of the bayonets gleaming about the food carts; of the weary, useless dragging from one official to another; of nightmare walks to the relief works, barefooted, through the snow; of the old mother creeping to the poorhouse that she might be buried in a coffin; of the little chil-

¹ One of the most vital yet simple and calm narratives of the famine is contained in the Report of the Central Relief Committee of the Society of Friends, Dublin, 1852.

³ Pounds; nearly ten millions of dollars.

⁴ "Transactions during the Famine in Ireland," Report of the Central Relief Committee of Friends.

⁵ Sir Charles Trevelyan, "The Irish Crisis," p. 64.

dren moaning out their lives in deserted cabins—these, not grateful thoughts, were what the Irish peasant brought out of the famine. And these he has taught his children. Yet to individual benefactors the people were grateful to a pathetic degree.

In this article I shall try to describe the experience of one of such benefactors, a good woman who belonged to that best abused class in the world, the Irish landlords. Her experience was not exceptional; rather, I like to believe that it was typical, and that all over Ireland women were toiling, like her, for their suffering dependents. There are two ways of viewing a cyclone; we may stand safe on a hill or be down in the stress of the storm. No one can doubt which has the wider vision, but the other's experience is incomparably more vivid. As regards the cyclones of human life, in history we have the post on the hill; but sometimes, vicariously, we may mingle in the storm. A packet of old letters, a pile of moldy newspapers, bring us to the shoulder of some stout fighter, and we see the storm as he saw it, breasting its fury, or spent and conquered in the wreck.

I would look at the Irish famine through the windows of an old manor-house in County Cork. Not very many miles from the ancient town where Sir Walter planted his first Irish potatoes was the estate of the C——s of D——. D——, the town, is a compact little place with the manor-house a mile away at one end, and a big, many gabled, brick almshouse at the other. In 1845 the town had a population of some eight or nine thousand souls. The houses are of stone, whitewashed in Irish fashion, and the doors swinging on the street, where the old crones in their frilled caps and blue cloaks squat on the earth sidewalks to smoke their pipes and gossip. Here and there a sociable pig will be studying the scenery from a second-story window. The shops make a puny show of color with prints, tobacco, ribbons, and such huckster goods, and the shopkeepers live above. A few tall houses of stone and stucco, having stone sidewalks in front and pretty gardens behind, are the homes of the gentry—the rector, the doctors, lawyers, and one or two gentlemen who have property in the neighborhood.

The Bandon River runs through the town. A sparkling thread of a stream it is, and so shallow that one of the C——s assured me that she had waded across without wetting her feet. The explanation is that the bed of the "river" is sprinkled with great stones, from one to another of which she stepped.

Thackeray passed through D—— in 1842, and the curious may find a few lines about it in his "Irish Sketch Book."

The next stage [there was no railway then] was a place called D——. Here it was market-day, too, and, as usual, no lack of attendants, swarms of peasants in their blue cloaks, squatting by the stalls. . . . There is a little miserable old market-house, where a few women were selling buttermilk; another, bullocks' hearts, livers, and such like scraps of meat; another had dried mackerel on a board; and plenty of people huckstering, of course. Round the coach came crowds of raggedy and blackguards fawning for money.

I fear that the women of the people did not strike him favorably; he speaks of not seeing a pretty face at the markets for fifty miles.

Every woman has bare legs, of course; and as the weather is fine they are sitting outside their cabins, with the pig and the geese and the children sporting round. Before many doors we saw a flock of these useful animals, and the family pig almost everywhere; you might see him browsing and poking along the hedges, his fore and hind leg attached with a wisp of hay to check his propensity to roving. Here and there were a small brood of turkeys; now and then a couple of sheep or a single one grazing upon a scanty field, of which the chief crop seemed to be thistles and stone; and by the side of the cottage the potato field always.

The character of the landscape is for the most part bare and sad [he has passed D—— now, and is well on his way to Skibbereen, wretched and squalid town that shall come to have its uncouth name hideously famous for anguish of famine], except here and there, in the neighborhood of towns where people have taken a fancy to plant and where nature has helped them, as it almost always will in this country. If we saw a field with a hedge to it we were sure to see a good crop inside. Many a field was there that had neither crop nor hedge. We passed by and over many pretty streams running bright through emerald meadows; and I saw a thousand charming pictures which want as yet an Irish Berghem. A bright road winding up a hill; on it a country cart, with its load, stretching a huge shadow; the before mentioned emerald pastures and silver rivers in the foreground; a noble sweep of hills rising up from them, and contrasting their magnificent purple with the green; in the extreme distance the clear, cold outline of some far-off mountains, and the white clouds tumbled about in the blue sky overhead. . . . Some way beyond D—— the road takes us through a noble, savage country of rocks and heath. Nor must the painter forget long, black tracts of bog, here and there, and the water glistening brightly at the places where the turf has been cut away. Add to this, and chiefly by the banks of rivers, a ruined castle or two; some were built by the Danes, it is said. The O'Connors, the O'Mahonys, and the O'Driscolls were lords of many others, and their ruined towers may be seen here and along the sea.

This is the landscape to the life. I feel a melancholy pleasure examining the picture. What a simple, narrow, leisurely, thriftless sort of good cheer hangs over the cottages with their pigs and geese and laughing children. Plenty of

time to frolic with the babies or bargain and chatter in the market-place, and potatoes enough to fill all their mouths. Even the beggars, then, were not hungry; they were begging because they craved those luxuries of mackerel and milk and meat described; and, very likely, the dreadful little green apples also, which Thackeray did not see, but which are everywhere in Ireland to this day.

Poor childlike, untidy, cheerful creatures, one wonders how many of them were to die miserably only a few years later.

The manor-house stands a little way from the town amid beautiful gardens and plantations¹ of firs and birches. It is a square stone house, not later than the Georges. The old manor-house is only a ruin. It stood in the center of the town, for when it was built by the first baronet safety was more desirable than any beauty of surroundings. He was a well-hated man, that first Sir Richard; yet there is a letter from Lord Chesterfield to him, in the family archives, praising his "humane policy." But he was a stanch Protestant, and religious feeling ran high when William the Third was king. The kitchen windows of the house have a queer broad shape and look like gable windows that have had a fall in the world, blinking out above a disproportionate length of wall; they were, in fact, windows of the ordinary form, but were built up during the Whiteboy riots. The other windows fared the same, but in their case the masonry has been removed. There were later riots, and the C—— of that day received a sword from the Duke of Wellington for his services with the yeomanry. This C—— inherited the estate by right of his mother, and added the C—— name to his own. He was the cadet of a noble Scotch family whose every title is an outrage to Irish ears, and he was a most irascible and domineering old personage. Once he walked through his village of D—— and smashed every tea-pot. He regarded tea as a beverage above the station of his tenants. "Such airs!" he snorted; "the likes of them drinking tea."

Doubtless it was a relief to the tenants when he went to America and bought property there, and was gone for years at a time. Long before the famine he died, and his son reigned in his stead. He lived in America, making frequent visits to Ireland. But his two sisters had always lived at the manor-house and cared for the tenants. They were both unmarried and no longer young; Kate, the younger, was past forty, while her sister was ten years older. The men of the family were a roving race, but the sisters clung to the old home. Kate was born in America, but I cannot say that

she was pleased with her birthplace. She always protested against being called an American: "Should I be a horse, then, if I had been born in a stable?" said she. She was a little, slight, active woman, with the fair Irish skin and the Irish black hair and blue eyes. Frail as she looked, no exertion or fatigue could conquer her spirit. For miles around the cotters knew her flashing smile and gay word. Shrewd as she was kind-hearted, they "never tried to come the comether over Miss Kate." Martha was the oldest of the family. From the description of one who knew and loved her I imagine a tall woman, gentle and sad, wearing an elderly cap and almost always in black robes, for there were few living then out of a great family whom she had loved with a mother's devotion. Her eyes were bright, and though grief and ill-health had laid a fine network of wrinkles over her features, her skin retained a youthful freshness of color. She had beautiful hands and very small feet. They were a hereditary gift of person; but I do not think that otherwise Martha inherited the C—— beauty. The beauty of the family was married and gone away.

Martha had always been an invalid. Racking headaches tormented her; she had a constant cough. Nevertheless she made so light of her ailments that her weak health is only a second thought in one's impressions.

The life of the sisters was secluded. It is pretty to see what metropolitan splendor Cork assumes in Miss C——'s letters. Indeed, a kind of Old World innocence and simplicity clings to her air of education and high breeding, just as, I am sure, a soft odor of lavender clung to her old-fashioned silken gowns of state. One can see by her letters that she had read widely and was deeply interested in politics. Never was a more ardent Tory. Lord Derby she is convinced is "a *sound* Protestant and real Christian," as well as "a man of real talent," and the Lord Lieutenant she admires loyally when she goes to Cork to see him open the Exhibition; "he is a kingly looking man." But it is hard telling whom she regards with the holier horror, Lord John Russell or the Pope. Either of them would destroy Ireland unless stopped in his fell career; and they never get across her page without a thumping. A deeply religious woman, her piety, in this age, looks a thought austere; but she had the tenderest and most unselfish of hearts, and whenever this good heart and her harsh prejudices dispute, the prejudices are sure to be left in the lurch.

Thus this Protestant lady and her "papist" tenants dwelt together in the utmost amity. Strange, truly; it seems to recall that vanished feudal devotion in these discordant times. The people brought all their troubles to the manor-

¹ Plantations in Ireland are groves of planted trees.

house, from the "baccagh's" inability to find the rent to the "colleen's" quarrel with her sweetheart. Every summer a prodigious store of sweetmeats was put away for the ailing. Flannel and tea were dealt out to the sick; and—matter even nearer the Irish heart—there was always fair harkening to complaints. Under the sister's mild rule the estate prospered—as prosperity is counted in Ireland; tillage was increased, and rents, which were mercifully low, were paid with reasonable promptness. Then the famine came. No one can comprehend the complete prostration of Ireland who does not realize the condition of her social fabric. Here is a country where, save in a small portion, manufactures are practically extinct. A few decaying mills, a few fingers still moving above lace curtains and looms in the cabins, a few rude fisheries¹—there you have a nation's resources. By consequence the population is virtually thrown on the land. To make matters worse, the land laws tie both landlord and tenant hand and foot.

The acts of the Irish parliament, during the latter half of the eighteenth century, offering a bounty on the exportation of corn and restricting the importation, had the immemorial consequences of such legislation. They lured men of small capital, or no capital at all, into agriculture, which had assumed a fictitious value. Having no money, the new farmers paid their laborers in rent, allowing them bits of ground whereon they would erect hovels and raise potatoes.

Now give to this squalid multitude, living on the edge of starvation, a priesthood loved and trusted by them, which shall have to depend for its living mostly on wedding and christening fees: the Roman Catholic clergy had been more than human if they had consistently discouraged early marriages or small holdings. There was another motive: they conscientiously believed early marriages desirable on moral grounds; and when principle adds its impetus to interest we all know the result.

Finally, supply this population with the very cheapest food, which shall also be food raised with very little labor in a marvelously small space; have no career outside open to the younger sons of the gentry and professional men; have a multitude of middlemen who make profit rents out of subletting their property; cap the cairn of hindrances on the body of enterprise with an absent or a ruined aristocracy, and what happens? Simply this: the

ordinary movements of trade and society may go on in a feeble fashion, but any additional load will break the whole.

It is not understood how desperate the position of the Irish landlords was in 1845. Really half of them were ruined. There was a grand show on the rent-rolls, but deduct the charges on the revenues, the annuities, dower charges, marriage portions, interest on debts, and the remnant will cut a shabby figure.

Sometimes a gentleman with a nominal rent-roll of ten thousand a year had hardly two thousand. Yet he must support the position of the man with ten. Inevitably estates of this kind grew more and more encumbered. Half the apparent rapacity of the landlords is due to this frightful disproportion between their revenues and their state. When the famine came many landlords gave up the struggle. Having long paid the bulk of their income as interest to their creditors, now, there being no rents, they had nothing left to pay. The creditors seized on the rent-roll, since at that period they could not sell the land. All over Ireland there were landlords who had no more word in the management of their reputed estates than the poorest cotter. A report of the period tells of one barony where "every one of the landlords—from Mr. —, who is in possession of 500,000 acres, to the lowest of them—was involved, lived on an allowance, and had his estate managed by the agency, so that the poor" were "placed between a landlord who" was "unable to give them any assistance and the agent who" had "no interest in giving them any." Even those landlords who had a competent income beheld it almost swept away. At one blow the income of the landlord and the subsistence of the people were annihilated.² The first hint that I have of the calamity which was to assume such overwhelming size, affecting D—, is in a letter written by Miss C—to her brother, the landlord, in January, 1845. She describes the failure of the potato crop, "everywhere rotting in the pits," and regrets that she can send him so little money. Less and less money was sent, until during the year 1847-48 the landlord did not, in the words of an old friend, "get enough from the estate to buy the children a pair of shoes."

The damage to the crop this year, however, was only partial. The early crops had escaped entirely, and some potatoes of the later crop could be used. Wheat, oats, and barley were a full average crop. At D— they planted more "green crops"—turnips, carrots, and the like—than on many estates. Miss Kate, who was her brother's agent, reduced the rents. Relief works were opened by the Government, and some of the poorest tenants earned enough on them to keep soul and body together. The

¹ During the famine people on the sea-shore lived on limpets and seaweed or died of starvation because their tackle was too poor to catch fish, although the sea was full of them.

² Report of British Association, Appendix A, p. 96.

relief works were mainly on the highways. Some pottering with so-called "reproductive works," such as the draining and planting of farms, and some attempts to improve the fisheries, hardly ought to count; what an Irishman understands by the "relief works" is work on the roads. The testimony is unanimous that whether the works were good for the men they certainly were not good for the roads. They leveled the hills, or rather they hacked away at the hills; but harvest time found them still standing, and they were frequently left in the condition of the celebrated hill between Castle Richmond and Castle Desmond.

Before the famine was over there was a suffocating rush on the works. This is the description of one of the board:

The attraction of the "Queen's pay," as it was popularly called, led to a general abandonment of their other descriptions of industry. . . . Landlords competed with each other in getting the names of tenants placed on the list; farmers dismissed their laborers and sent them to the works; . . . the fisheries were deserted, and it was often difficult to get a coat patched or a pair of boots mended.¹

The C——s were not of the landlords who thus shifted their own burden to the Government's shoulders. Miss C——'s language about the works is as caustic as her usual strictures of Lord John Russell's measures.

They have cut up the country into a parcel of useless roads; spent more of the immense sums on hired officials than on the poor, who continue dying on the roads by hundreds, of hunger and of cold; and damaged the people still more by congregating them in idle groups and drawing them away from all agriculture—so that now the spring is advancing, no farming doing, no prospect but of a perpetuity of famine and taxes.

Government, however, closed the relief works, and planting was done, although it seems clear that the tillage did suffer on account of the works. Still, at D—— the crops were planted. The sisters told each other, hopefully, that after a scarcity there always came a year of plenty. Kate, who was the active one, brought back cheering accounts of the fields green with harvest. The D—— people had used up the narrow margin of savings, of household furniture or pigs or cows; but they had only begun to be in want. The "Queen's pay" had kept the poorest alive. In July, Ireland drew a long breath of reviving hope; by the middle of August, every Irishman knew that the potatoes were gone. Miss C—— regularly sent her brother the Cork newspapers. Late in August the little circle in America that looked with

such painful interest for the Irish news must have read the Cork reporter's despairing conclusions. The crop was clean gone.

The people are in an absolute state of bewilderment. The blast has been nearly universal; and such is the effect that the stalk and stems thus blasted break off quite rotten like, and the young potatoes that are found are mostly black. All the change has taken place within the last fortnight; until then everything was promising.

That was the shock of the calamity, it was so sudden. In July—this, too, the circle at B—— must have read—Father Mathew passed from Cork to Dublin, and "the doomed plant bloomed in all the luxuriance of an abundant harvest." On his return, a week later, he saw "only one wide waste of putrefying vegetation," and the "wretched people were seated on the fences of their decaying gardens wringing their hands and wailing bitterly." August 16 Miss C—— wrote, with bitter calm:

Ireland is ruined. God has manifested his continued wrath against us by completely destroying the potato crop. Never was there a greater quantity planted, never a more glorious prospect of plenty, but about three weeks ago the black spots appeared, and the whole crop is gone. It is said to be worse than last year. His arm is bared to destroy us. You thought it bad enough when you were here, but ah! we little knew how happy we were then. And extreme as seemed the poverty then, it was only *seeming* to our present misery. The tide of emigration is as great as ever; all who can are flying from a land which seems doomed to destruction.

Already the times were felt by the landlords. Nearly every one she knows is cramped by loss of rents and the enormous poor-rates. Her brother has been sick, and she fears that it was from anxiety of mind. She longs to see him, but she would not wish him back to "this dismal country"; and she compares the frantic misery of the people, beginning to show itself in riots, to the state of the Jews in Jerusalem before its destruction.

While the potato crop was a total failure, the wheat crop was "barely an average one," and rye and barley were scant. On the Continent, too, rye and potatoes failed. There was famine in Scotland, in Belgium, in France. Miss C—— writes:

The worst of it is that no one has any heart left. Kate is busy about her farming. Our crops are much better than our neighbors'. Were they not, what would become of us? It is our only resource now.

She alludes to a little farm adjoining the manor-house, which, like many Irish landlords, they farmed on their own account. Kate was the farmer—a very successful one, it appears. She had profited by her brother's American

¹ Sir Charles Trevelyan, "The Irish Crisis."

experience. The tenants stared and howled Irish ejaculations over the outlandish machines that came down from the Cove of Cork. More perplexing and awe-inspiring were the strange grains that sent emerald spikes through the meadows. Both the landlord and his sister had long realized the danger of depending upon a single crop, and that the cheapest of all foods. But it was quite another matter to bring the tenants to this way of thinking. Farmers would come to the manor-house and gaze with awe on the huge pumpkins raised under glass, they would praise the waving fields of wheat and oats, and they would exchange sly winks of amusement over the ragged rows of Indian corn which Miss Kate vainly tried to make grow under that humid and uncertain sky. They said, "Shure, thim will do for the gentry; but 't is the praties that kapes the hunger down." They resisted all innovations with the dogged obstinacy of their race. But there were other crops on the estate. Alas, in that fatal year all crops failed together!

The relief works opened in September and instantly were crowded. Over half a million of men at one time were employed. In the month of March the expenditure on the works rose to the enormous sum of £1,050,722, or something over five million dollars.¹

Nevertheless the wages of the men did not keep their families. How could they? The wages were only tenpence a day. Besides, there was a great multitude who had no direct providers, widows and orphan children and aged creatures who might have been helped by kinsfolk or neighbors in ordinary times; but now every man's hands were full if he earned bare life for his own. There were the almshouses for such people; but in the remoter districts often they did not know about the poor-laws, and always they hated "the house" next to death.

The year before had swept the wretched cabins clean of all those things which they could sell or pawn; now they sold their pigs and chickens and ponies and cows. They sold the cloaks which the women wore, and the men's frieze coats. Presently there was nothing left to sell; they ate up the scanty harvest, they ate up the potatoes that they had laid by for seed. Then—they began to die.

Early in September Miss Kate raised what money she could on her own and her brother's credit and laid in a stock of Indian meal.

This, be it remembered, was before the Government had stirred. The year before, when the crop failed, Indian corn was bought in America, and depots were established in different parts of Ireland where meal was sold under the market price to the different relief committees.²

But these depots had been emptied. It was necessary to start afresh. Miss C—— passionately accuses the English Government of not realizing the situation, and doubtless she only echoed the sentiments of harassed and impoverished landlords all over the country. At that time the corn laws were in force. Indian corn in 1845 had a duty laid on it so high that it was practically unknown in the United Kingdom. And it was easier to repeal the law than to remove the ignorance. She says:

Every measure of our rulers from the beginning has been foolishness and waste. They were warned a year ago of what was coming, but they kept utterly aloof until the distress was at its utmost height and hundreds starved to death; said British commerce must not be interfered with, and though petitioned by thousands to take some step to lower prices they have refused; allow speculators to traffic in the blood of their fellow-creatures, and when, at last, shamed by the loud cry of desperate misery, they did something, it was to set up *relief works*! . . . to support the people in sloth and idleness, and taxes laid on the country that her wretched revenues can never support.

Poor lady! But the Government also was a subject of compassion, confronted by the woful problem how to feed a starving nation without ruining both Ireland and England. It would hardly have helped matters to have made all the corn merchants in the United Kingdom bankrupt.

This letter was written before the repeal of the corn laws, and before the enterprise of the Irish dealers had filled the markets and reduced Indian corn from £19 a ton in February to £13 in March and £7 10s. in August, and it was before the British Association was organized, or that vast and searching system of relief had been arranged which saved the country.

The period between August, 1846, when the Irish landlords knew that the harvest was gone, and the arrival of the first war-steamer loaded with flour and pease on the southwest coast of

¹ "In order to check the exorbitant demands which had been made during the preceding season, the whole of the expense was made a local charge, and the advances were directed to be repaid by a rate levied according to the poor-law valuation, which makes the landlords liable for the whole rate on tenements under £4 yearly value, and for a proportion, generally amounting to one-half, on tenements above that value."

("Irish Crisis," p. 37.) The former relief works expenses were half a grant and half an advance, the advance to be repaid by the barony.

² These relief committees were formed all over Ireland, with a central committee in Dublin. They sold meal to those who could buy, and gave it to those too poor to buy. Their funds came from private subscriptions.

Ireland, was a time of dreadful anxiety and of consequent indignation.

Miss Kate bought her Indian meal and established a store in her kitchen, where meal was sold under the market price. As long as the people could buy, they purchased. Miss C—— and her sister knew the circumstances of every family on the estate; when a farmer who still had something left approached, and, in Irish phrase, "made a poor mouth," Miss Kate stopped him briskly: "There 's the dun cow's calf, Higgins; we'll give you the worth of that in meal. You know every penny we get will go for more meal." Soon they were obliged to guard the door of the impromptu shop. Policemen stood outside to keep back the horde of frenzied, dying creatures, lest they should rush in and fall upon the whole stock of provisions. "Never was Ireland more bloody, more riotous, than now," wrote Miss C——. They had no fear of their own people's violence,—they could be made to understand that the supplies must be husbanded,—but out of caves and bogs squalid, emaciated shapes crawled to the merciful ladies who were feeding the poor.

When they sat down to their niggardly meal, as plain now and hardly more plentiful than the portion they served to the starving, they had to have the shutters drawn in order not to see the ranks of wolfish eyes glaring in at the table.

They were always coming upon hideous sights. Once it was a mother and her two children whom they found crouched against a tree. Her husband was dead, and one child. Maybe it was the fever killed him, she said; they had some of "the yally meal" when he died, and a turnip that a neighbor gave her. With his last breath he had told her to go to the manor-house. She knew she was n't of their people, but she had no one else. They cared for her and she lived.

By this time pestilence was increasing the horrors of famine. They risked their lives by their humanity, but it was a daily risk for them and for others of the helpers in D——; because the fever did not spare the well-nurtured and clean, though it sprung out of filth and want.

The wretches died too fast for burial. Sometimes they dragged themselves almost to the house, then sank on the way. One poor lad the two sisters found with his head on a flower bed and the hydrangeas nodding above his pinched, ghastly brown face. So wasted was he that the two women picked him up and carried him to the house. When he revived enough to speak he tried to point, saying, "They 're beyant!" He meant his mother and sister. They were found and cared for.

They survived; but the faithful child, whose last thought was of them, died before they could reach the house, in the arms of his kind bearers. They had no leisure to grieve over him. An awful feature of those days of darkness was that the mind, being so hurried from one scene of anguish to another, lost its capacity for separate pity, and was only sensible of the crushing weight of despair always upon it, pressing a little more heavily each time. Before that terrible winter ended, suffering that formerly the sisters would have discussed compassionately for weeks, they almost forgot in the crush of new agony at its heels.

Well might Count Strzelecki, the volunteer agent of the British Association, write to his chiefs:

No pen can describe the distress. . . . It has actually reached such a degree of lamentable extremes that it becomes above the power of exaggeration and misrepresentation. You may now believe anything which you hear or read.

What painfully increased the difficulties of the situation was the condition of the roads and transportation. Ireland had few railroads, and as soon as winter came the highways were in a horrible condition. The relief works, so far from mending matters, often had succeeded only in turning what had been merely a bad road into an impassable one. At the same time there was an unprecedented demand for horses, and fewer horses than ever before, for horses as well as men died, and those left were so meagerly fed that they had not strength to pull. Towns were small and scattered. In the region about D—— there were districts without a mill or a granary or a single shop for the sale of provisions. The people of such districts must walk ten or twelve miles to D——. Count Strzelecki tells of men walking twenty and thirty miles to buy meal and then, such was the pressure on the scanty shops, being obliged to go empty-handed away. And twenty or thirty miles away among the bogs the wretches' starved women and children were waiting for them. In all the letters and reports of the time distances are mentioned. Always the people are walking from remote homes to the works or the village or the soup kitchen. Miles on miles, thousands of miles, must have been traversed in torment that winter. To me there is nothing ghastlier in all the famine than this vision of incessant motion; of a squalid procession whose life is dribbling away with every step. Yet what could the relief officers do? It took time to establish depots of provisions, and provisions must be hauled. By water it was no better. There were so few ships that freights jumped to an appalling fig-

ure,¹ and often vessels could not be hired at any price.² Bantry must have been the nearest point where the relief committee of D—— could obtain provisions in any quantity; but I am inclined to think from the letters that most of the supplies came from Cork. They sent their own cars and horses, and their own people went as escort, armed to protect the precious grain. Besides the relief committee there was a "Ladies' Association." It consisted of a number of ladies in the town and vicinity, being a branch of the general association of women which extended all over Ireland. Miss C—— was at the head of the D—— committee. Of this committee one of the agents for the British Relief Association wrote as follows:

They reach many cases that no relief committee could, and are personally daily cognizant, for miles around, of the actual state of the inhabitants of the cottages scattered far and wide. The working is admirable.

The Ladies' Association worked with the relief committee to whom the general supervision of the K—— district belonged. The chairman was a trusted friend of the sisters, a wise, good man; happily, also, a man of wealth. His help of counsel and of money was great; it was a grievous misfortune that he died this year. The rector of the parish was an invalid, but the young Irish curate, Mr. L——, did the work of ten men. The sisters had other helpers in their own household, helpers who knew the character and necessities of the people better than any gentleman or gentlewoman could know; the servants of their house were the private soldiers in that pitiful battle with famine and the plague. It was they who carried the peat for the fire and made the beds and kept the rooms for the sick who were brought within the manor-house to die (for it came to this with the hunger, that those who succumbed very rarely could be revived), and it was they who served in the kitchen, cooking the meal and rice and soup. The head of the men was a bluff, red-faced giant who rose from a boy in the kitchen to be manager at this time, and later a large farmer. He kept the skeletons of men at work in the fields. At one time, so generally had the men gone to the relief works, that he was forced to hire girls to do the planting. Neither was his case uncommon in the southwest that year.

Of the women I see only one head out of the crowd, a square, wrinkled, honest, shrewd Irish face in a frilled cap; her short neck making her chin rest on her blue cloak. She

was the cook, a servant of the old time, infinitely attached to the sisters, whom she ruled kindly but firmly, never for a second "forgetting her place," but getting her own way quite as effectually. Like all Irish servants, she had an incomparable ingenuity in makeshifts that served the whole family well. At this time she was a young woman, not cook in chief, only a kitchen maid. She made a cake of Indian meal and water very like our Southern hoe-cake, I fancy. The sisters did not share the prevalent ignorance of the gentry regarding "Indian wheat." Thanks to their brother's American training they were able to cook the new food properly. An American cannot realize the intensity of the Irish prejudice against new foods, especially the "yally meal." They believed it would turn black those who ate it. Of course they did not know how to cook it—nor anything else beyond potatoes. The women used to mix the meal with cold water and eat it thus, grumbling with some reason at the "bitter bad stuff." Either from ignorance or avaricious intention some of the millers ground bits of the husk with the corn. "The back av me hand and the sowl av me fut to the yally male!" screamed one irate old woman at the relief committee. "Shure it's scratched all up me throat is wid thryin' to swally it! It's needles they put in it."

But before that winter ended the people considered themselves happy if they could get the "yally meal." Undoubtedly, however, its use half cooked did bring on disease.

As winter advanced the distress grew deeper and fiercer. It was a hard winter, cold rains and snows alternating. To famine and fever was added cold. Hundreds of cabins in County Cork had nothing on their earth floors save a few rotten bundles of straw—not a blanket, "not a stick of furniture." Neither could the people afford in many cases even the cheap peat fires. The men tramped barefoot through the snow to the relief works. Their rags hardly covered their bones. It was the commonest thing in the world for men to be "struck with the cold" and die in a day or two.

I find in the letters of this time constant reference to the need of clothes. Writing to a dear friend in America, Miss C—— acknowledges the receipt of two boxes of clothing. "The two boxes," she says, "arrived safely last night all right, according to the lists. Oh, if you could see the absolutely naked state of our whole peasantry, your benevolent hearts would feel a sweet reward in seeing so many comfortably clothed and hearing the bless-

¹ The freight for a barrel of flour from the United States to Ireland before the famine year was 2s. 6d.; by the winter of 1847 it was 8s. or 9s. Indian meal rose from 8s. to 18s.

² One gentleman offered £240 to the Cork Company for a steamer to carry a cargo of meal to Kenmare. The offer was refused. (Report of British Association.)

ings poured on your heads by the receivers." Clothing came from England as well. Often the garments were of an incongruous gentility, but the backs under them were as warm. One difficulty in this direction was that the starving people would pawn their clothes. But after a time the pawnbrokers refused to advance money. In this same letter Miss C—— speaks of their efforts to employ the hordes of idle women and children in wool spinning and making flannel. Some of the women were instructed in sewing, and altered or made garments. By this time the destitution had reached the class of tradespeople and farmers, and the terrible circle was continually widening.

I find slight mention in Miss C——'s correspondence of relief received from official sources. So overwhelming and paralyzing indeed was the distress at this time, that districts where the landlords were partly caring for their people were passed by in favor of utterly helpless regions where there was none to pity. But the efforts both of the Government and of individuals were herculean. The Society of Friends raised over a million of dollars, of which a great part came from the United States. The British Association spent £263,251. The Irish local relief committees raised £199,470, to which the British Government added a donation of £189,000. All over the world Englishmen sent money to Ireland. The Irish in America out of their poverty sent a million and a half dollars. Cargoes of corn and rice were sent from every part of the United States. I have before me a list of the freight paid by the British Government on gifts of food from America for the relief of the poor of Ireland and Scotland in the years 1846-47, and the total is more than forty thousand pounds.¹

Yet in February Miss C—— wrote to her brother:

No tongue can describe, no one can imagine, the horrors. Independent of hunger, fever, and death, in how many ways our comfort is utterly destroyed. Pigs, geese, fowls, horses dying everywhere; no poor man can keep his horse or cow; carriers knocked up; Indian meal and the coarsest flour 2s. 7d. a stone—how can the laborer on 10d. a day keep his family out of that? People are dying of hunger by hundreds, and the sufferings of women and young children are dreadful. Our porridge-pot and griddle are never off the fire to feed the skeletons at our door, who we fear will die after eating the bit. I have been obliged to send the newspapers with the worst accounts to England and Jamaica to try what they will do—this will cause irregularity in your getting. Kate and I are almost worn out. Since last September we have been every day selling meal in the kitchen below the market price. She works at trading, and I write for supplies of money: we have got

about £100 from England by my letters alone; but that is but a drop in the ocean of misery, but I praise God for honoring me by making me in *any* way an instrument.

The work has made her ill, but she is up again, "for the loud cry of misery in the whole south of Ireland will not let us rest. And the north and part of Scotland is little better."

With the spring the tide of misery overflowed. The starving people attacked the marines landing meal on the coast. Vessels laden with provisions were detained in the harbors because no pilot dared take them out to sea. Skibbereen is a few hours' drive from D——. The agent of the Society of Friends wrote:

This place is one mass of famine, disease, and death; the poor creatures, hitherto trying to exist on one meal a day, are now sinking under fever and bowel complaints—unable to come for their soup, and this not fit for them.

The skeletons crawled along the street and sometimes dropped dead on their way to the soup kitchen.

Another correspondent, writing from Castle-town Bearhaven, a neighboring town, begged for help, saying that of twenty thousand souls in that parish the "greater part" were "suffering all the horrors of famine and of fever and dysentery." So reduced were the people that unguarded help was fatal to them. One man said to the relief agent, "If they get any strong dose at all, they die off at once." He explained that by a "strong dose" he meant "a full meal."

In County Mayo there was a more squalid and desperate misery than in County Cork. In one day in a single small town eight inquests were held on the bodies of poor people who had perished "for want of the necessities of life."

A dreadful kind of apathy or a more dreadful frenzy possessed the starving people. There were crimes beyond any one's remembrance for number. A farmer living near D—— sold a cow. He was killed for the money as he was returning home. The assassins were arrested, and one of them immediately cut his throat with a piece of window-glass. Hope had abandoned all classes. An agent of the British Association describes his visit to one of the miserable hovels not half a day's driving from D——. Says he:

I found three grown-up emaciated women, with three or four children. On inquiring as to whom they had to work for them they pointed to a corner, where an old man lay, their father, the only male left in the family. None of them had a fraction of money, and the only food in the house was a pannikin half full of a certain kind of thick gruel, of which they all had had a couple of mouthfuls each in the morning. Through an interpreter (the man only

¹ "Transactions during the Famine in Ireland," Appendix VIII.

spoke Irish) the old man said he had lain down to die—as also said all his daughters: there was no help for it.

In one village, “which in better times must have been prosperous, for they had grass for forty cows one side the village and for thirty-five on the other,” they had “a *little* seed,” that is, potatoes. They would not sow it, because “when the harvest came it would not be their property, and were they alive they would be murdered by those who had none for their crop; they would lie down and die after eating the little they had kept for putting in the land.”¹

All over the country men and women could be seen “redigging the potato grounds, in hopes of finding some few remaining.” They were bending over the fields which the sheep had deserted, trying to find turnip roots. Families were known to have lived for weeks “on the flesh of horses that had died.”

A Skibbereen man with a family of five had nothing for them all to eat from Saturday to Thursday except eleven and one-half pounds of potatoes and a head of cabbage. He walked several miles to the works, and the superintendent gave him a piece of bread; he tried to swallow it and dropped dead.

Such are some of the “worst accounts” in the papers which would be delayed in coming to her brother, but which did come. Again she writes to him; each letter, now, carries a deeper gloom.

The approaching summer presents a dreadful prospect. I think half the population will be swept away, and the other half eat each other. And if the landlords do not get their rents they can neither help the poor nor themselves. Yesterday the first person was buried in K—— churchyard without a coffin—poor Davy C——, long ago a laborer of ours. We have kept all our people from starving as yet.

So the winter wore away into spring. The land was tilled somehow, but with almost hopeless hearts. Still Miss Kate sold her meal to the hungry crowds below in the kitchen, and up-stairs her sister filled page after page to go to England, to India, to America. She had asked her brother to interest his American friends. So effectually was this done that a cargo of provisions was bought, and a generous merchant gave the use of one of his ships to take it to the Cove of Cork.²

It came at the darkest hour.

For six weeks the kitchen fire at the manor-house had not been allowed to die down. Night and day the haggard crowd besieged the doorway where the policemen stood.

The fever was making the streets of the town horrible. Mr. L——, the curate and the parish priest, used to wrap the dead in tarred sheets and so bury them—together.

In March the agent of the British Association, announcing his purpose to visit D——, had said, “Though I do not fear that they can be suffering the intense misery and raging fever, with perfect absence of food, that they are truly suffering on the sea-coast”; but March 14, after the visit has been paid, he writes:

I regret to say that in every place I have lately visited, and which I named as about to do in a former letter, I have found the distress, disease, and deaths have very much increased; nothing can exceed the wretchedness that is and has been existing; it is the spreading so rapidly that now principally horrifies the visitor.

The people would not plant, they said the crops would be taken from them, better to die now; and they crouched in the doorways or the corners of their cabins and looked on with dry eyes while their children died; they were a little glad when the moaning ceased, but they did not notice anything any more.

As yet the D—— people had kept famine at a little distance, but the fever and kindred diseases increased steadily. Steadily, too, those precious sacks in the pantry grew lean.

It was at this juncture that news came of the American gift; I have Miss C——’s letter of acknowledgment before me. The first words are a copy of the resolution of thanks.

The D—— Ladies’ Committee for the Relief of the Poor beg leave to make their most grateful acknowledgments to the ladies and gentlemen of Binghamton for their generous exertions on behalf of the starving people of D—— and Skibbereen, in contributing the sum of four hundred dollars for the purchase of Indian meal to be divided between those two parishes. The meal is not yet arrived, but is daily expected. They are also informed that about six hundred dollars has been sent from Binghamton to other parts of Ireland. The committee particularly express their thanks to the family of E. W——, Esq., of Binghamton, who have been actively instrumental in directing the attention of their friends to these parishes, and to the ladies who have so kindly exerted themselves as collectors. Truly our American sisters have not been appealed to in vain. May the Lord reward them as he only can; and may the blessing of those who are ready to perish be on their heads.

This is dated April 28, and signed on behalf of the D—— Ladies’ Committee by Martha C——, her sister, the rector’s daughter, and three gentlewomen of the vicinity.

Miss C—— continues on the same sheet to her sister-in-law:

I have sent this according to your directions, and I have also sent the same to B—— W——, who is the kind and dear friend in Philadelphia who has done

¹ Report of Relief Association, Appendix A, p. 62.

² Now Queenstown.

so much for us in collecting and publishing, and I have requested him to have it published and send it to the W——s, and you can also, if you think fit, send it to Charles C——, to be published in New York. I feel so grateful to the Binghamtonians and to you that I should like to publish it everywhere. We have put it in the Cork paper, which I will send you; but you know ladies don't like to have their names in print when they can help it, therefore our committee would not sign their names for the Cork paper, but directed me to acknowledge it, as I have done. We got the paper with the account of the relief party at the W——s', and I beg you will make my most grateful thanks to all the kind friends in and about Binghamton who have stretched out the hand of compassion to Ireland in this her day of utter and hopeless misery. To you my dear, dear —— and ——, we feel most grateful. I did not at all doubt your wish to exert yourselves for Ireland, but I feared in your remote place [Binghamton is a wealthy town in the State of New York!] little could be done. How mistaken I was! I should have written this before, but was in hopes I should be able to announce the arrival of the meal—but got tired of waiting, thinking it appeared so negligent. Now when we get the meal we shall let you know by newspaper, for it is better for both you and us to save postage as much as we can; it will fill *some mouths*. We are in as miserable state as ever nation was, and the coming summer presents as dismal a prospect as that which has passed. Famine and pestilence are rioting over the land. All the best of our people are flying to America, leaving behind them an inconceivable legion of idleness, filthiness, and beggary to drag the whole nation into the gulf of pauperism. [She complains that the people hang about the roads and will not plant; and the overcharged heart brims over in wild invectives against the Government.] I have long suspected that British speculators, with Lord John Russell at their head, wish to get possession of all our lands by breaking or starving us out of them—and see when poor Paddy, who is always complaining of his own landlord, has an English one whether he will be the better for the exchange. But it is useless to complain; our tyrants have no pity, and absenteeism and popery have ruined the land. If they would only tax those wretched absentees who have drained our vitals it would be some comfort.

They are still laboring with their meal sale and their gifts of food: "Now our labors and expense are tremendously increased by having to cook rice, arrowroot, sago, stewed biscuit for the sick." Rice was valuable food, especially for those suffering from dysentery. By this time there was very little buying of food. Another soup kitchen was established in the town, but there seemed no diminution in the numbers at the manor-house door, nor to the demands on the sisters. "In fact," Miss C—— writes in this same letter, "our labors, combined with the shocking circumstances and the

hurry and confusion in which we are kept, are very harassing. And not being able to *hope* for the end thereof, . . . I am glad most that those I love are in your happy land. God bless the Americans; they could send a war vessel with meal for our wants, though our own *paternal* government could not!"¹

She continues her recital of the horrors attendant on the famine:

The dogs are constantly digging the scarce covered bodies out of the graves. Even at K—— [part of the estate] the women carry their dead on their heads and scratch a little hole to lay them in. Whole families are laid down in fever, and as their neighbors are afraid to go near them, they die one after the other, and remain unburied sometimes until it is too shocking to describe. At D—— I do not know of anyone who has died of actual want of *any* food; but *slow* starvation, never having enough, and so often what they have had, is killing as surely: when the creatures get the fever or *any* ailment they sink at once. Do not be unhappy about us; we are breasting the storm bravely, and the Lord supports us under all. Let us say, His will be done. If we are driven from this land we have the right of citizenship to an American home. One of our priests is just dead of fever, and poor Mr. B—— got his from a man who rushed out at him holding up two dead children. He only lived five days.

In the same letter Miss C—— acknowledges the receipt of five hundred dollars from Petersburg, Va., and "a most excellent letter from Peggy C——'s husband." "We are amazed," she says, "at the success of our appeal, and say again, God bless America!" She did not then realize how much greater was to be the American gift than she imagined. I find in the list of ships' cargoes one consigned to "the Misses C——," and entered at Cove of Cork. The fever-stricken skeletons stood in the streets as the carts loaded with meal and rice and flour rolled by, and called on God to bless the Americans.

Autumn saw the potato patches green again, and though the blight appeared, the crop was not destroyed, while oats, wheat, and barley were gathered in quantities which had not been known for years. In August, Miss C—— could write to an American friend: "I am thankful to say the pestilence seems abating. American supplies have relieved our famine and lowered the price of food." In another part of the same letter she says:

The public papers have probably told you all. I need only say that there was not the slightest exaggeration in the appeal—no language could enlarge the horrors of our situation. I have passed through deep waters of domestic affliction; have seen the

¹ Miss C—— refers probably to the *Jamestown*, which was manned by volunteers and sent to the coast of Ireland, while the *Macedonian*, provisioned and manned in the same way, was sent to Scotland. But

I do not understand the allusion, since the *Dragon*, the *Vulcan*, the *Terrible*, and half a dozen revenue cutters had been or were landing provisions on the southwest coast.

ravages of cholera which swept over D—— with peculiar and fatal malignity; have encountered the perils of flood, fire, and storm; but never did my eye see, my ear hear, such sights and sounds of misery as in the last year, and fatigue of body and distress of mind have almost worn us away. We seldom had time to think of our danger from the pestilence which crowded around our doors and windows: the Lord has graciously kept it from our dwelling, but many of the helpers have fallen, . . . all by the pauper fever, and within a very short time. Its ravages among the respectable in other places are equally great; for it is remarked that the poor don't often die *in* the fever, but of weakness and want of nourishment *after* it. The disorder caught from them is most malignant.

The famine indeed was stayed, but its effects remained, and are to be discerned to this day. The small tradesmen were bankrupt almost in a body; the middlemen were rooted out of the country; all professional people had suffered; while the gentry were three-fourths of them ruined, in fact if not in name. There is a letter from Miss C—— to her brother, written in 1848, which describes their own straitened condition and incidentally reveals the distracted state of the country.

That fatal year [she says, meaning the famine time] seems to have rung the death knell to the hopes of this doomed country. I have not written for a long, long time. But my silence has not been because my heart is grown colder to you or feels less pain on your account—far from it. I have not yet attained that privilege of old age—in my case it would be a privilege—of being weakened and indifferent in natural affection; but when I cannot write cheerfully I have no heart to write at all. . . . I wrote you last to Philadelphia and sent you an order for [word illegible] pounds, all I could save out of my pocket-money. (I have never had any to save since.) . . . Think of Lord ——'s estate being brought to the hammer of the "Encumbered Estates" courts! . . . As we grow older troubles seem to thicken about us and all our friends. I think God in mercy ordered your and the children's return to America, grief as it was to me at the time. Hundreds of gentlemen's sons and daughters, whose rank and prospects were as high or higher than theirs, are now scattered, the sons listed for soldiers or common sailors or clerks in the poorhouses, the daughters gone as governesses, waiting-maids even. . . .

Lord B—— is almost ruined by . . . the change in the times. . . . I don't know what you have heard of deaths and other changes in D——. All the old stagers are either dead or emigrated to America save John P——, who is still our faithful manager. Peggy B—— is dead, and her husband died last year in the poorhouse. Joan R—— dead, her sons all gone to America. D—— of B—— a ruined man and said to be deranged, Dan H—— sold out of all his property and become an idiot. Larry —— a ruined man, still at —— tormenting us about his rent, which we are always obliged to process him for. . . . I saw Nora L—— lately. She is settled near Ballydeman, her man farming—is very, very poor. She came to see us, driving a little donkey butt; the same lively, cheerful creature, but looking sadly wasted and worn. Poor Dr. —— is forced to resume his profession again; has twelve children and nothing else left.

And so the careless, sad gossip slips down the page, and the curtain drops on the kind, gloomy lady among her ruined neighbors. But I would lift up a corner for one pleasanter scene, since it shows the Irish heart. After better days came, the C—— tenants, headed by the parish priest (it pleases me to fancy that it was the same good fellow who worked during the famine), clubbed their shillings and purchased a splendid silver service for "the ladies of the manor-house," in recognition of their efforts during the famine time. The presentation was made by the parish priest, and the moment was one of the few bright memories in many somber days.

Long ago that tender and sorely tried heart ceased to ache. She died amid the blessings of the poor. Her life had many sharp sorrows, yet we may count her happy inasmuch as she, an unworldly, elderly gentlewoman in feeble health, with no weapon but her pen, saved hundreds of humble homes, and won, as no soldier or statesman in her long line of ancestors had ever won, the wild gratitude and love of the most unhappy, intractable, and faithful of races.

Therefore it is that I, child of another age and different hopes than hers, reared to a pernicious tolerance—so it would seem to her—of the principles that she abhorred, lay this little sprig of remembrance on her grave.

Octave Thanet.

THE TWO SPIRITS.

I DREAMED two spirits came—one dusk as night:
 "Mortals miscall me Life," he sadly saith;
 The other, with a smile like morning light,
 Flashed his strong wings, and spake, "Men name me Death."

James B. Kenyon.

AMONG THE MONGOLS OF THE AZURE LAKE.

A WIND PRAYER WHEEL.

THERE is a legend among Mongols and Tibetans that when the saintly king of Tibet Srong-tsan-gambo, who reigned in the seventh century, attempted to build the great temple called Jo K'ang, which now stands in the center of Lh'asa, the ground sank under the weight of the walls. Again and again the work was begun, but always with the same result. So he sent out messengers who visited all the holy and wise men of eastern Asia to learn from them the cause of his failure. One of the messengers, worn out by years of travel and unavailing search, was on his way back to Lh'asa, following the road which caravans still take when journeying from Hsi-ning to that city, when the buckle of his saddle-girth broke. Seeing a tent near-by, he rode thither and asked an old blind man whom he found there to give him another so that he might continue his journey. While he was drinking a cup of tea the old man asked him whence he came, and he told him that he had been on a long pilgrimage to the great shrines of the Buddhist faith in the eastern country. "Many and beautiful are the shrines in the east," quoth the old man; "nowhere are there any to be compared with them. They have been trying to erect one at Lh'asa, but all their efforts will be of no avail, for under the ground at the spot they have chosen is a subterranean lake over which they cannot build. But should the secret, of which I am the sole depositary, ever reach the ears of a Lh'asa man, the waters will recede from their present bed and, bursting through the earth, bury this broad steppe beneath them." Then up jumped the king's messenger, and crying to the old man to flee, for he was a Lh'asa man, he dashed off at full speed.

The old man had but time to warn his people to flight and then sat praying, awaiting his doom. That same night the waters broke through the earth and rapidly spread over the country, forming what is at present the Koko-nor, "the Azure lake." To put an end to the deluge, which soon would have buried the whole broad steppe in its dark blue waves, one of the gods took the semblance of a crow, and bearing a great rock in its claws it flew over the waters and dropped it into the chasm whence rushed the flood. This rock is now known as the Lung-ch'ü tao ("the dragon colt's island") by the Chinese, and hereby hangs another tale. In olden times, when came the winter and the lake was covered with ice, the people who lived on its shores used to take their mares and drive them to the island. In the spring, just before the ice broke up,—for then, as now, there were no boats on the lake,—they went back to the island, and lo! with each mare there was a colt, and these were known as "dragon colts," and could travel three hundred miles a day. There are no more dragons or dragon colts on the island nowadays, but only a few ascetics, to whom the people carry food in the winter when they can cross over to them on the ice.

The Koko-nor is about two hundred and forty miles in circumference and is without any visible outlet.¹ Its waters are brackish and, according to Prjevalsky, of no great depth. My road lay along its northeast side over a well-watered steppe, and then through the Buha gol valley at its western extremity. We crossed a number of good-sized streams flowing into the lake, the beds of several over a quarter of a mile in width, and, though they were partly dry at that time, they showed that in the rainy season an immense quantity of water must be brought down to the lake. We saw but very few tents of either Mongols or Tibetans, certainly not fifty altogether. But no conclusion must be drawn from this as to the density of the population. The pasturage in the vicinity of the lake is necessarily poor on account of the caravans, which continually pass through, grazing on it, so that the people have to seek other spots which have the further advantage of being better protected from the wind than is the plain along the shores of the lake.

¹ Its altitude above the sea level has been calculated by different travelers at from 10,000 to 10,934 feet. My observations give it as 10,900 feet.

Although the Buha gol was not the largest stream we had to cross in this part of the journey, it was one in which I took a special interest. Huc's passage of this river when journeying to Lh'asa has been considered by more recent travelers as one of the most powerful pieces of romance in a book which is supposed — most unjustly, I think — to be full of inventions. He describes in his usual graphic style the crossing of the river by the great caravan in the darkness of a November night, how the heavily laden yak broke through the ice, and the general confusion and excitement that ensued. Where I crossed the river it was not over fifty feet wide and about three deep, but its bed was over a quarter of a mile in width. The stream was fortunately free from ice; but it frequently happens in this region, where the nights are very cold and the days hot, that ice forms over the river to a thickness of several feet, but it is so rotten that it will hardly bear the weight of a man, to say nothing of a yak or a camel. Thus was the Baléma gol when we crossed it, and so we found other streams in this region. It may well have been that Huc had the same experience; there is nothing incredible in his story. In fact I have had several persons who frequently traveled this road, traders from Hsi-ning and Tankar, tell me that they had been delayed two or three days on the bank of the Buha gol from the difficulty of getting their caravans across.

Along the south bank of the river runs a chain of mountains of porphyritic rock, forming the watershed of the Koko-nor. It is a continuation of the range which skirts the great lake along its southern edge, but is less elevated, being little over a thousand feet in altitude. It was called, where I crossed it, Dagar-té-ch'en, but there is no name applicable to the whole range.

The day I passed the Buha gol I had hoped to be able to reach Dulan-kuo, the residence of the Mongol prince of the Koko-nor, on the south side of the Dagar-té-ch'en; but I had counted without my camels. Hardly had we begun the ascent of the mountain when two of them gave out, and, refusing to go a step farther, lay down. If any other animal gives out it is still possible to make it travel a few miles by a judicious use of patience and a club; but not so with a camel. When he lies down he will get up only when he feels like doing so; you may drag at the string which is fastened to the stick through his nostrils till you tear it out, he will only groan and spit. It was my first experience with camels, and I vowed that it should be my last; for, taking them altogether, they are the most tiresome and troublesome animals I have ever seen, and are suited only to Asiatics, the most patient and long-

suffering of human beings. Besides their infirmities of temper, resulting, I believe, from hereditary dyspepsia, as evidenced by such coated tongues, offensive breaths, and gurgling stomachs as I have seen with no other ruminants, they are delicate in the extreme. They can work only in the winter months, for as soon as their wool begins to fall, Samson like their strength abandons them. They can travel only over a country where there are no stones, for the pads of their feet wear out and then they have to be patched, a most troublesome operation. The camel is thrown and a piece of leather stitched on over the foot, the stitches being taken through the soft part of it: in this condition it may travel till the skin has thickened again; or, what is more likely, until it refuses to take a step.

The next day we pushed on a few miles, the loads of the camels having been transferred to the backs of our saddle ponies, but we only reached Dulan-kuo on the third day after crossing the Buha gol. On the road we met a small party of Tibetans and Mongols going to Tankar. They had come from Lh'asa, which they had left in November. We stopped to have a chat with them and to hear the latest Lh'asa gossip. They said that war was still waging between the Tibetans and the English, and that all central Tibet was in arms. It appeared that the lamas had got a large body of troops from eastern Tibet and had sent them to the front, assuring them that they had nothing to fear from the English, for they would accompany them, and from a safe place recite prayers and incantations which would make them invulnerable. In the first fight a large number of these men were killed or wounded; and disgusted with the inefficacy of their employers' prayers the remainder had marched home again, leaving the Lh'asa people to fight their own quarrels. They congratulated us on having traversed the Koko-nor steppes without having been waylaid and pillaged, and trusted that they might have as good luck and reach Tankar in safety.

Dulan-kuo (meaning "Hot place") is a miserable village of adobe hovels and one wooden house built by Chinese carpenters and belonging to the Prince of the Koko-nor (Ch'ing-hai Wang). Here live some two hundred Mongols, thirty lamas, and a minor incarnate saint known as a *Gagén*. This village, like those which I saw later in the Ts'aidam, was built some forty or fifty years ago by the Mongols as a means of protecting themselves against their bullying and thieving neighbors the Tibetan Panak'a. The greater part of the inhabitants of these villages do not live in houses, but in the yards adjoining the hovels, and which are surrounded by adobe brick

walls about eight feet high. Here they pitch their felt tents, and thus have all the enjoyments of camp life with the additional security afforded by strong inclosures and the proximity of neighbors. Dulan-kuo is in a narrow valley, on each side of which the mountains rise precipitously some 1200 feet, those facing south covered in places with cedar and juniper trees. Through the valley flows the Dulan (or Hulan) gol, which a few miles below the village empties into a small lake bearing the same name as the river. These Mongols, and also those of the Ts'aidam, cultivate the soil, but just sufficiently to procure what barley is necessary to them for their daily food. They are very poor: the Prince of Koko-nor owns only one thousand sheep, forty camels, and about the same number of horses. A man who has eight or nine camels, from ten to fifteen horses, and a few hundred sheep is considered well to do; and as his wants are very few, and easily and inexpensively satisfied, I suppose he really is. The greatest luxury among Mongols is snuff, of which they use enormous quantities. They powder the dry tobacco leaves bought from the Chinese, and as without the addition of some other substance it would be too strong, they add a quantity of yak dung ashes, which makes a mild and probably aromatic mixture. Like the Tibetans, they are not very fond of smoking tobacco, but of snuff they never can get too much.

Medicines also are much sought after by them. While I was at Dulan-kuo nearly every one in the village came to see me, and most of the people asked for medicines whether they were suffering from any complaint or no. Plasters were in great demand, as all the villagers had rheumatism, and the tighter the plasters stuck the better they were held to be. I had with me a bottle of Eno's fruit salts and tried to give some to the people, but when they saw the salts boiling and fizzing they thought there must be some magic about the medicine and would have none of it. Most of their troubles, sores, and eye diseases come from dirty habits, but one can never persuade them of the necessity for keeping clean. A friend of mine was once traveling among the Mongols and an old crone came to him and begged some medicine to put on a sore. He told her that before applying the salve it would be necessary to wash herself. She gave it back to him, saying, "I am sixty-seven years old and have never washed in my life; do you suppose I am going to begin now?"

One man came to me and asked for elephant's milk, and lost all faith in my ability as a physician when I told him that this remedy had not been recognized by the profession in my country. He said that it was passing

strange, for at Lh'asa, where he had twice been, it was a remedy in constant use, and that it was brought there from India.

Mongol physicians feel the patient's pulse on both wrists at the same time, and never ask any questions; or at least none concerning the origin and progress of the complaint, for if they did it would be held that they had shown ignorance in their profession. All the remedies I saw used in the Ts'aidam had been brought from Lh'asa, and were administered in the form of powders.

I remained at Dulan-kuo three days, during which time I was most hospitably entertained by the people, who invited me to their tents to dine, while the women sang choruses and some of the men played the guitar (*pi-wang*). They were all at my service while I staid there, ready to do any work for me or give me any information I might ask. Nearly all of them here and throughout the Ts'aidam could speak Tibetan, so I was able to get on without the assistance of an interpreter.

I have dwelt on the kind and cheerful disposition of these Mongols, because former travelers do not appear to have found them as genial as I did. Prjevalsky says of them that "Their eyes were dull and heavy, and their disposition morose and melancholy"; and that "The Prince of Koko-nor, a man of some intelligence, spoke of his subjects to us as only externally resembling human beings," being in all other respects absolutely beasts. "Knock out a few of their upper front teeth, set them on four legs, and you have regular cows," added he. I do not attach too much importance to the opinion of this "man of some intelligence," for a little farther on Prjevalsky states that he was twelve years old; but that of the colonel himself deserves more attention, and I am glad to say that my experience of these people — which lasted, it is true, only two months — does not bear out his very unfavorable opinion of them.

I was rather worried on the morning after my arrival at Dulan-kuo on hearing that one of the agents (*T'ung-shih*) from the Hsi-ning Amban's yamen had just arrived and was on his way to Tibet. I feared he had been sent, if not after me, at least to watch my movements, and have the roads to Tibet closed to me; so I sent one of my servants to speak to him and make him a few presents in my name, asking him to call as soon as he was rested. My man soon came back and told me that the T'ung-shih was on his way to eastern Tibet, there to collect the poll tax which the natives have to pay yearly to the Chinese in lieu of a former horse tax or tribute. Soon the T'ung-shih came to my camp. He was a handsome young man about six feet in height, with an extremely pleasing and open face. I told him

CAMPING ON THE KOKO-NOR.

that I was going first to southern Ts'aidam, then northward to Sa-Chou, and from that point to Hotien, and probably to India. Incidentally I regretted that the wars and rumors of wars in Tibet made it impossible for me to take the direct road to India (through Tibet), but that, as I had some years before been to Lh'asa, I was not sorry to have to take another route, although a much longer one. He said that he had never been to Lh'asa, though he had traveled all through eastern Tibet several times. He had many colleagues in the yamen, who had, however, gone there by the northern route (*i. e.*, the one from the Ts'aidam); and though they had only from fifteen to twenty in their parties, they had been able successfully to repel the attacks made on them by brigands and to reach their destination in safety. He believed I could do likewise if I had as large a party. As we should have to travel the same road between Dulan-kuo and the southern Ts'aidam, we decided to do so together. We soon became fast friends, and he eventually rendered me, on two occasions, important services, although I never saw him again after reaching southern Ts'aidam.

A little west of Dulan-kuo we came to the mouth of the valley and crossed a plain, some ten miles broad, in which are two small, brackish lakes, the Dulan-nor and Dabesu-nor. We camped near the mouth of a gorge which runs through the range of hills along its southern edge and marks the northern frontier of the

Ts'aidam. I had hired two Mongols with three camels to go with me to southern Ts'aidam, not only to serve as guides, but for the information I could gather from their conversations around the camp-fire: one of them was a Mongolized Chinese, the other the steward of the Prince of Koko-nor. I was much interested, while camping near the Dulan-nor, watching one of these men butcher a sheep. With his short sheath-knife he first skinned it, and then, spreading the skin on the ground, cut open the carcass and disjointed it. In a few minutes the head with the backbone attached was all that was left on the ground, and half a dozen pieces of meat were already in the kettle. Among this people the sheep's tail and the brisket are considered the best pieces; but nothing is rejected, not even the intestines. They are always careful to remove every particle of flesh from the bones, and if it is a marrow-bone they crack it and eat the contents. A Mongol or a Tibetan nomad would never dream of leaving the smallest particle of food put before him, and in the case of cleaning bones of the flesh it is even looked upon by the latter people as a test of a man's ability. They say that by the care a man gives to this work one can judge what he would give to other and weightier matters in life. The shoulder-blades of sheep are much valued by these peoples for divination, and when I was wandering through the deserts of northern Tibet my Mongol guides used to divine

TIBETAN IDOL.

by them every day to see what fortune was in store for us. When the bone is dry they hold it in both hands to their foreheads while they mutter a short prayer, then put it into the fire, where it remains until thoroughly charred. Examining the cracks and crevices made on it by the fire, from their direction and location they learn what will befall both themselves and their animals. They also ascertain by this means what the weather will be, and experts can even cast a horoscope. So great is the Mongol's belief in this mode of divination, which our learned men have seen fit to call by no less formidable names than "scapulimancy" or "omoplatoscopy," that they will not undertake any work or journey if the shoulder-blade is against it. They have a number of other divinatory methods, of some of which I shall have occasion to speak later; but none of them is more popular than this one.

Having crossed the Timurté range we entered the waste of the Ts'aidam, in its northern part a sandy desert on which only a little brush grows, and farther south nearly everywhere a shaking bog covered with a crust of saline efflorescence and traversed by a few streams which are finally lost in the swamp in the center of this broad plain, some four hundred miles from east to west. The Mongols live chiefly near the mountains that border it to the north and south, where the heat is less great, and where there are no mosquitos. The average altitude of the Ts'aidam is a little over 10,000 feet above the sea level, consequently much lower than the Koko-nor and

the country to the south of it, the desert tableland of north Tibet, which has an altitude of over 14,000 feet.

We were six days crossing this desert, in which we saw only a few herds of antelope and wild asses. The Mongols now and then manage to shoot some of the latter, the hides of which they sell to the Chinese, who use them to make saddle-flaps.

The village of Baron Ts'aidam, near which the road to Tibet begins to ascend to the great tableland, was finally reached, but I found it a miserable, tumble-down place of only twenty or thirty hovels, where nothing could be bought for either men or animals. I staid there only a day, and saying good-by to my friend, the T'ung-shih, pushed on to Shang, a large village some thirty miles to the east, which had been represented to me as a land flowing with milk and butter, where horses, camels, and yaks were plentiful and cheap.

The district of Shang, which comprises the southeast corner of the Ts'aidam, is a fief of the Talé lama, to whom it was ceded by the Mongol chiefs of this country, probably towards the end of the seventeenth century, when they transferred their allegiance from Tibet to China. Although the population is entirely Mongol, the ruler is a Tibetan lama, whom I should like to dignify with the title of Lord Abbot of Shang, but I cannot bring myself to dub with a name so fine sounding the dirty old monk filling this office whom I found living in a corner of his kitchen and eating with his fingers. The people call him *K'ampo*, or Abbot, and his rule is not, they told me, an oppressive one, save that he insists rather too much on their observance of conjugal fidelity, a virtue held in as light esteem among Mongols as is cleanliness. The village has some seventy-five or eighty hovels in it, and the people live as they do at Dulan-

IDOL WITH DRESS OF YELLOW SATIN.

kuo, some in tents in their yards, some in the houses. The country around Shang, which is several hundred feet higher than Baron and no longer an open alkaline plain, but shut in on each side by high mountains, is well cultivated, and flocks of sheep, goats, and bunches of camels and ponies graze on the hillsides.

On the tops of all the houses were little prayer wheels turned by the force of the wind, a simple arrangement like an anemometer placed on them catching the air and so keeping them

a few other delicacies, among which were several pieces of brown sugar from India. Two or three days later, my camels and luggage having arrived from Baron, I made him some presents, and he invited me to dine with him. I found him seated on a pile of rugs in a corner of his kitchen and surrounded by his habitual cronies, his steward, his cook,—an old Mongol who had traveled in China and who now acted as his minister of foreign affairs,—and a number of village loafers, who could always get tea and tsamba in his house. I, and

A TIBETAN CAMP.

in motion. In the hands of most of the old men and women were bronze or brass prayer wheels, which they kept continually turning, while, not satisfied with this mechanical way of acquiring merit, they mumbled the popular formula "*Om mani pémé hum*," the well-known invocation to Avalokiteshwara, the would-be savior of the world.

The abbot was very gracious at first, and I thought for a while that he would help me in organizing a party to travel southward or towards Lh'asa, and possibly give me a pass. He sent me a large Mongol tent to live in, as there were no good or large rooms to be found in the village; and his cook, who was also his prime minister, brought me from him a huge lump of deliciously rancid butter and

two of my men who accompanied me, sat down on his right with a long narrow stool or table before us, and taking our cups out of our gowns handed them to the cook, who filled them with buttered tea. After we had talked for a while, large wooden platters with chunks of boiled mutton piled upon them were put before us, and we set about devouring this Homeric meal, eating only the best part on each piece and then passing it to one of the bystanders, who finished it. After this dishes of rice, with *choma*, butter, and brown sugar, were given us, and the feast ended with vermicelli and hashed mutton, a concession to our Chinese tastes. When we had eaten as much as we could a great jug of Tibetan wine, called *néch'ang*, was brought in. In taste it is

something like small beer, or Chinese *samshu* mixed with water, and is a cheering but not inebriating drink. Tibetans have, however, a stronger liquor called *arak*,¹ on which they get royally drunk, and the abbot told me that he loved it, though any kind of liquor was good. He certainly showed his fondness for it that afternoon. Seeing him in such a happy frame of mind, I broached the subject of my journey to Tibet and asked him if he would allow some of his people to accompany me, and hire or sell me pack-animals. Then he told me the same yarns I had heard already so often about the dangers of the roads leading thither, of the brigands who infested them, of the pestilential emanations which killed both men and beasts, and gave many other reasons for my not attempting the journey. I told him that I was on my way home to India, and that I could not turn back, but must go on. Then he advised me to go to Sa-Chou, and thence by Khoten to Ladak; but I explained to him that I had not money enough to afford such a long and roundabout journey, and that, speaking Tibetan, I preferred to travel in Tibetan country. He then said that he could not help me; that none of his people had ever been over the deserts of northern Tibet, and that he would not let them risk their lives in the attempt. He added that the Mongols of Baron often went that way with caravans, and that if I asked their chief to help me I might perhaps find him willing and able to do so.

In the evening his cook and foreign secretary came to my tent and repeated to my men all the abbot's stories with embellishments of

JAMBYANG.

in the village some Chinese traders from a place between Hsi-ning and Tankar, and they had been most kind and friendly to me. They came to my assistance when they saw my men despondent and afraid to stay with me,—for they had more than half believed all the stories told them,—and gave them another version of travel in Tibet; and so successfully did the traders persuade them that there was in reality very little to fear, that they one and all told me of their firm determination to accompany me anywhere. I decided at once to give them a taste of desert life, and to prove to them that the much dreaded “pestilential emanations” were only the rarefied atmosphere at high altitudes, and that the sickness was due to diminished pressure on the vascular system. I did not make them the above learned explanation, as my Chinese would not have carried me through the “vascular system” part of it, but managed to make them understand it in simple language. My plan was to follow to its source beyond the great range of mountains to the south of us the course of the river which passes at Shang, the principal one of the Ts’aidam, and then come back to the camp of the chief of Baron, a trip which probably would occupy me a week, and during which I should have to cross passes at least 16,000 feet above the sea level.

Many of the people of Shang spoke to me of Prjevalsky and his Cossacks, whom they had twice seen in the Ts’aidam. The foreign costume of the Russians had struck them very much, especially the flat forage caps of the soldiers; but of all their customs that of making the sign of the cross had appeared to them

JAMBYANG.

their own, hoping thereby to deter them from accompanying me farther. There were then

¹ Mongols give this name to a drink distilled from fermented mare's milk which we call kumiss. I asked if it had any curative properties, but was assured that it had none, and further inquiry elicited the fact that

consumption was a disease not unknown to the Mongols. They were amazed at the idea of our drinking kumiss to cure this malady.

the most extraordinary and inexplicable. They told me that Prjevalsky had visited Shang, but I can find no corroboration of this statement in his works, nor have I been able to learn of any foreigner having been to this place before me. They said that on his last journey to the Ts'aidam he was accompanied by at least forty men, and that he had gone south into eastern Tibet in the hope of reaching Lit'ang. He had never been heard of since, and had most likely been killed by the wild Golok or suffocated by pestilential emanations.

While among the Mongols I was much struck

sociable, they are without any of the polite manners which characterize the Chinese and even the Tibetans. Among them there is even no expression which corresponds to our "Thank you"; so on receiving a present they cannot thank the giver, although they will sometimes with both hands raise the gift to their forehead. Their form of salutation consists in holding out both hands, palms uppermost, bowing slightly, and saying, "*Amour sambéné.*"

While at Shang I exchanged my camels for ponies, which are much more serviceable pack-animals, and require less attention and care. The Ts'aidam ponies are of a very poor breed,

BY THE VILLAGE OF BARON TS' Aidam.

with the perfect equality of all classes. The poorest man in a tribe will enter his chief's tent, sit down, drink tea, and chat with him, and receive the same welcome as would the chief's relatives or most intimate friends, except that he will not occupy a seat beside his host, but will squat down near the door, while the host sits nearly opposite the door and a little to the right. In like manner the chief of a tribe will visit any of his people, sitting in their tents like their equal, possibly trying to beat them in a horse trade, or arranging with them some business venture on part profits.

Although the Mongols are kind-hearted and

mostly sway-backed and with such long hoofs that they are bad mountain animals; but anything was better than camels, and had I not been able to find horses I should have done as many of the Mongols and Tibetans do—ridden yaks. As it was, when ready to leave Shang I found myself the owner of fourteen ponies, eleven of which were as miserable-looking jades as ever lived.

Having secured the services of a guide to go to the source of the Bayan gol, I sent two of my men with the packhorses by the direct route to the camp of the chief of Baron, and with the other two I started out with the

EYESHADE
AND CASE.

lightest possible outfit on the 24th of April, to give them a taste of life in the desert and incidentally to try to shoot some of the bears, wild yaks, or asses with which the country to the south of the mountains was said to be alive.

After following the course of the river through a picturesque cañon for some thirty miles, we left it when half through the range, and, going up a side gorge, crossed the mountains by a steep and difficult pass, the top of which was covered with several feet of snow. In

this we floundered about holding on to the tails of our horses till it was nearly dark, and only managed to get to the lower edge of the snow line late in the night, when we threw ourselves down among some rocks, and supperless awaited the dawn. This pass is called the Amnyé-k'or, and is about 16,200 feet high. On the north side of it we saw several large herds of wild yaks, also bears and wolves; but as the march was a long one and I was kept busy surveying its endless zigzags, I had not time to go after them.

The next day we once more struck the river in a fine open valley some twenty miles west of the Tosun-nor ("Butter lake"), its principal source. Here again the country was alive with game of every description, and the ground was so thickly covered with yak and wild ass droppings that it looked like a vast barnyard. While the men were getting our tea ready I saw a herd of about fifty yaks coming down to the river, half a mile away from us; so, picking up my Winchester, I crawled up to within about two hundred yards of them and let fly at the biggest one I could pick out. At the report of my rifle the herd made a rush in the direction from which the noise had come; but, as I was lying down behind some stones, they could see nothing and soon stopped. When I wished to reload my rifle I found the magazine empty, and I had no cartridges about me. Then, like the hero of "Happy Thoughts," I remembered all that had been said about the danger of this kind of sport — how the bull when wounded charges his assailant, that one's safety lies in keeping on firing at him, etc.; so I slunk away by a circuitous route as fast as I could without ever again looking at the yak. What was my amazement, an hour or two later, when riding by this spot with my men, to find the yak lying dead on the ice and the vultures already pecking it.

Shooting wild asses is a much more exciting sport, for these handsome beasts are extremely wild and their sight and hearing wonderfully acute; hence it is very difficult to stalk them. In size they resemble the domestic ass. Their color is invariably a bright fawn, running into white on the neck, belly, and legs. The head, which they carry very erect, is too heavy for the body, and the tail is short, with little hair. The flesh is coarse and tough, but not so bad as that of the yak, in comparison with which bull beef is a delicacy.

I spent four days in this valley, which is about seventy miles long, tracing the two branches of the river to their sources in the Tosun-nor and the Alang-nor; and then, turning northward again, I recrossed the range by another difficult pass called the Nomoran Pass, and found my men and luggage at the camp of the chief or Dsassak of Baron, on the north side of the pass, in the pretty little cañon of Narim.

I found the Dsassak a good-natured, fat fellow, about twenty-eight years old, whom I had met several times in Peking two years before, when he was there on his triennial visit or tribute mission to the emperor. He showed himself most kindly disposed and ready to assist me; although my lacking a pass from the Amban at Hsi-ning, a document that every traveler has to carry in these parts, made him at first fear that he might get himself into trouble with the Chinese authorities if he did anything for me. His steward, when he heard where I wanted to go, volunteered his services. He had been three times to Lh'asa and once through eastern Tibet, spoke Tibetan like a native, and was considered the most energetic man in his tribe. This was a good beginning, but when I tried to get seven or eight more men to go with me — without whom Dowé, the steward, declared that it was impossible to attempt to reach Lh'asa — I found neither the men, nor the money in my pocket to pay them if they had offered. The only man who tendered his services wanted forty ounces of silver, a very moderate

A TIBETAN CAP.

sum in reality, but at that rate I should have been left penniless before starting. It was not to be thought of. Another reason which made me relinquish with less chagrin the attempt to reach Lh'asa was the news of the arrival there, in January of that year, of a Russian expedition. The Dsassak assured me of the truth of this story, which he said he heard from a party

expedition to Tibet under Colman Macaulay tended to prove that so large a party as that of Prjevalsky would meet with strenuous opposition at every step of its progress through the country.

Finding that I could not possibly undertake this journey, I resolved to try to go through eastern Tibet and reach either Assam or Ssu-

IN A MONGOL TENT.

of traders who had recently passed through on their way to Tankar. At Shang the same story had been told me, so it was not an invention of this chief, and later I heard it again from a Tibetan chief south of the sources of the Yellow River. How this report had been spread through the country I cannot conceive even now, unless it was that the Chinese authorities had informed the Tibetan government of the start of Prjevalsky's last expedition for Tibet, and of the permission they had given him to visit Lh'asa, if he could. The rumor had probably been noised about the country and had finally become the tale told to me. At all events I was inclined to believe it, although the recent fiasco of the great British

ch'uan in China. All this country was unexplored, and I knew from Chinese works that it was full of interest both to the geographer and to the ethnologist. The Dsassak did his best to dissuade me from attempting it, for he declared this to be quite as dangerous a journey as that to Lh'asa. Especially did he dwell on the nearly insurmountable difficulty I would experience in crossing the Dré ch'u, as the Yang-tze-kiang is called in Tibet. He said that in 1884 Prjevalsky—he called him the Russian Amban—had attempted to do so, and had gone with about eighteen men and some fifty camels as far as the bank of the river. But the lamas who lived in a convent on the farther shore had, by their prayers and incan-

SILVER CHARM BOX FROM LH'ASA.

tations, raised the wind and the waves so that he could not effect a passage, and he had had to turn back. Then he was attacked by the wild Golok who roam over these desert steppes in search of caravans to pillage, and in a nearly destitute condition he returned to the Ts'aidam.

In a tent near that of the Dsassak dwelt a living Buddha, a man whom all the Mongols held to be a most wonderfully endowed saint. He was a native of eastern Tibet, and was known as the Lab jyal-sé-ré. He passed his time in prayer, thus warding off all calamities from the country, the people, and their flocks and herds. Especially was his wonderful foreknowledge of use to all those who were about to start on journeys or to undertake perilous expeditions, for he could foretell all that was to befall them. Taking a few presents, and accompanied by the two Mongols who had offered me their services, I went to the Gégén's tent, and having given him a long blue silk scarf called a *kata*,—the indispensable accompaniment of any present or request,—together with the other presents, which comprised a convex and concave looking-glass, a razor, and a piece of soap, I begged that he would deign to disclose to me the fate of my expedition; should I be able to cross the terrible Dré ch'u and eastern Tibet, or should I be obliged to retrace my steps and fail in my attempt? He took up from beside him a little gold box in which were dice, held it up to his forehead while he muttered a prayer, opened it, and looked at the dice. Then he took a book, and turning over the leaves till he reached one whose number corresponded with that turned up on the dice, he conned it for a while and then delivered himself of this remarkable prophecy: "You want to go through Ch'amdo? Well, between this place and the Dré ch'u you will perhaps have trouble and fall in with brigands, or per-

haps you will not. As to the Dré ch'u, it is a terrible stream to cross, and you may cross it, or you may not. But as to traversing all eastern Tibet and reaching Jyagar [India] or Ssu-ch'uan, I cannot tell; it is beyond my ken. Be careful, be careful."

My Mongols listened with bated breath and awed and reverent silence while he thus foretold the fate of my undertaking; and when the lama had spoken they declared that nothing could be more satisfactory than this; they were ready to go anywhere with me; my luck would evidently be good.

Then the Gégén, who was a youth of not over nineteen, very handsome, and, wonderful to relate, quite clean (he was not a Mongol), turned his attention to the presents I had brought him. But all his science, accumulated through his many incarnations, was not enough to disclose to him the use of the piece of soap. He did not like to confess his ignorance, but finally he had to pocket his pride and ask me what that queer stuff was.

The next day we were occupied in buying food for our journey,—mutton, butter, and tsamba,—in arranging the pack-saddles and loads for the ponies, and in overhauling our slender kits. In the tents of the two Mongols who were to accompany me lamas were busy reciting prayers with beat of drum and ring of bell, in writing out charms for them to carry on their persons, and in examining charred shoulder-blades of sheep. Nearly every man in the valley came to my camp and gave me some advice about the journey; among others the Dsassak and his brother, who told me that it would be prudent for me to say wherever I went that I was a T'ung-shih from Hsi-ning or Peking, as they were the only men who could travel through these wild parts of Tibet without let or hindrance, and that, though I had no pass from the Amban, the simple fact of my being employed in his or in a similar office would greatly facilitate my progress. A little later on in the day the Buddha sent one of his lamas to tell me the same thing. I followed their advice with the most happy results. My men clung with such persistency to this fiction that I never had to tell the lie direct myself; they took that trouble

WOODEN CHARM BOX FROM EAST MONGOL.

off my shoulders. The fact was that they did not believe they were making any important misstatement, for though they knew that I had held an official position at Peking, they could not conceive that it was independent of the Chinese government; they simply thought that I and the other men employed with me in the legation were regular Tung-shih, or agents in the pay of the Chinese to facilitate the transaction of business, the presentation of tribute from our people. This is the opinion of nearly all Chinese as regards foreigners; for them foreigners are but frontagers of the great empire, of the Chinese world, and tributaries of the emperor. I have often been questioned in China as to the form of government in my country, and when I replied that our sovereign was changed every four years, that his title was Pi-li-shih-tien-te (the best transcription our treaty makers have been able to coin for the word President), and that he had a council of about four hundred members, they expressed astonishment that there was still in the world a people sunk in such savagery.

But to return to the Mongols. We remained in the Narim Valley for five days, during which time snow fell heavily (we were then in the first days of May), so that they doubted whether we could cross the Nomoran Pass

again for some days to come, and Dowé, my new guide, proposed that we should try the Hato Pass, a little to the east of it. This road was very rocky, but a little snow was usually found on it at this season of the year. The Dsassak did his best to make me stop a few days longer with him, sending me every day a big bottle of *arak*, and *tarak*, or sour milk, by the bucketful; but even these luxuries had not the power to delay me, and on the 5th of May I broke up my camp and moved about fifteen miles in the direction of the Hato Pass, which we did not cross until the third day after leaving Narim, as snow had again fallen on our way up to it. I found this pass a great deal easier and lower than the two others I had crossed in this range; its altitude is 15,290 feet, and there was hardly any snow on it. The descent on the south side was extremely steep though short, and we soon found ourselves near my old camp, some ten miles east of the Alang-nor. And now began the most fatiguing portion of my whole journey, across the desert tableland to and far beyond the sources of the Yellow River, amid snow and piercingly cold winds, with starving horses, the sickening effects of the rarefied air, and the constant fear of falling in with some party of Golok, the Bedouins of northern Tibet.

W. Woodville Rockhill.

THE MEMOIRS OF TALLEYRAND.¹

INTRODUCTION BY THE AMERICAN MINISTER TO FRANCE.

TALLEYRAND has been dead fifty-two years. Within two months the first volumes of the memoirs he left are to be issued. He himself forbade their publication till thirty years after his death, and at that date his literary executors found a further postponement necessary. He was thought to be the depository of more secrets than any other man of his day, with greater power over the reputations of more men, living and dead. Naturally these memoirs were long awaited with a singular mixture of curiosity and alarm. Not the least element of the absorbing interest which still attaches to them arises from the desire to see how much of the piquancy and flavor of a famous man's recollections may evaporate in half a century.

The career these memoirs portray was and remains unparalleled in modern Europe for

length and variety of distinguished service. Beginning with Louis XVI., from whom he received his first appointment, and from whom he went later with a letter to the king of England, Talleyrand served in all eight known masters — besides a great number of others who were at one time or another said to have him secretly in their pay. He became President of the Constituent Assembly which organized the French Revolution. He was sent to London on a secret mission with a passport from Danton. He was Minister of Foreign Affairs under the Directory, under the Consulate, under the Empire, under Louis XVIII., and under Louis Philippe. In diplomatic skill and success contemporary public opinion held him the first man of his period — that is to say, for half a century the first man in Europe. As to real influence on affairs, it is doubtful if any minister since can be said to have exerted as much, with the exceptions only of Bismarck and Cavour. Even they did not cover so wide

¹ Copyright, 1890, by THE CENTURY CO. All rights reserved.

a range, or deal with such a bewildering variety of negotiations, extending over so great a time, and furthering the views of so many masters.

Sir Henry Bulwer has a phrase that, in a way, measures him: "He was the most important man in the Constituent Assembly after Mirabeau, and the most important man in the Empire after Napoleon." But to gage fairly his extraordinary public life it must be remembered that he held place and gained in power for forty years after Mirabeau's death; and that he had been one of the leading men of France before Napoleon was heard of, and remained a minister and an ambassador of France long after Napoleon had eaten out his heart at St. Helena.

Yet, in spite of his amazing career, his countrymen have not been generally disposed to speak well of him. Napoleon called him a silk stocking filled with filth, and on occasion addressed the same epithet directly to him. Chateaubriand said of him: "When Monsieur Talleyrand is not conspiring, he is making corrupt bargains." Carnot said: "He brings with him all the vices of the old régime, without having been able to acquire any of the virtues of the new one; he has no fixed principles; he changes them as he does his linen, and takes them according to the wind of the day—a philosopher, when philosophy is the mode; a republican now, because that is necessary in order to become anything. To-morrow he will declare for an absolute monarchy, if he can make anything out of it. I don't want him at any price." Mirabeau called him "this vile, base trickster"; and again wrote: "It is dirt and money that he wants. For money he has sold his honor and his friend. For money he would sell his soul—and he would be right, for he would be trading muck for gold." The very member of the Assembly who secured his recall from exile, Chénier, wrote of him:

This letter of the Abbé Maurice proves to me that after having been anarchist and Orleanist, and not having been Robespierreist only because Robespierre would n't have him, he has now become a partizan of the Directory. This limp-foot, without respect for his bishopric, is like a sponge, which sucks up every liquid into which it is dropped, but, unlike the sponge, he never gives anything back. Here he is, recalled from exile yesterday, and proposing proscriptions for to-morrow. If the Directory wants blood, look out for your head; Maurice will not refuse it.

Modern French writers, while, of course, less passionate, have been apt to agree in admitting his extraordinary venality, his treachery to his chiefs, and his lack of veracity. Lamartine admired him, but Louis Blanc was as severe as the bitterest of his contemporaries. Guizot said he was a man of the court and of diplo-

macy—not of government; that he was indifferent to means and almost indifferent to the end, provided he found in it a personal success. And, to quote but one opinion not coming from his countrymen, Gouverneur Morris said of him: "This man appears to me polished, cold, tricky, ambitious, and bad."

Few men, indeed, spoke well of him. Towards the close of his life, when he was Ambassador in London, an attack was made upon him in the House of Lords by the Marquis of Londonderry. The Duke of Wellington offered a spirited defense. "He had held official relations with M. de Talleyrand in most critical periods. Never had he encountered a man more vigorous and skillful in protecting the interests of his own country, or one more upright and honorable in his attitude towards other countries." Talleyrand was found the next day reading the report of this debate with tears in his eyes; and he said to his visitor, "I am all the more grateful to the Duke, since he is the one statesman in the world who has ever spoken well of me."

The evil in a public man's life is apt to attract wider attention than the good, and certainly no exception to the rule has been made in Talleyrand's favor. Yet, taking his career from the records of his countrymen prior to this issue of his own memoirs, what an extraordinary picture is presented! Here are a few of the lines in it:

A profligate priest, who owed his start in life to an ill-flavored joke about the immorality of Paris, made in the drawing-room of Mme. du Barry, the king's favorite.

A bishop who was forced into the public journals to explain that the money he had recently made in gambling was not won in gambling-houses, but in clubs; and that it was not so much as reported—being only thirty thousand francs, instead of six or seven hundred thousand.

A confidential friend of Mirabeau, who was accused of poisoning him.

A minister, and for years the intimate, of Napoleon, and yet accused of a plot to assassinate him.

A great statesman whose enormous and continuous receipt of bribes from the beginning to the end of his long career is unquestioned.

A trusted Minister of Foreign Affairs who, while in office under the Directory, thwarted their measures and plotted for the *coup d'état* of Napoleon; who, while in office under Napoleon, intrigued with the emperors of Russia and Austria to defeat his plans, and plotted for the return of the Bourbons; who, while in office under Louis XVIII., plotted for his overthrow, and for the accession of Louis Philippe.

The Constituent Assembly forbade his return to France. Pitt expelled him from England. Washington refused to receive him in America. The Pope excommunicated him.

And yet he lived to be summoned back to France, and appointed Minister of Foreign Affairs for the Revolutionary Government; lived to return to England as Ambassador from France, with the prestige of the most distinguished living diplomatist, to meet with a reception which could scarcely have been more respectful if he had been a crowned head; lived to give notice to the American Ministers Plenipotentiary in Paris that they must buy peace or leave the country; lived to have the Pope's excommunication withdrawn, and died in the odor of sanctity, with his king at his bedside, and the blessings of the Cardinal of Paris.

Many of the lineaments in this strange portrait, drawn by the French historians, are not likely to be much changed. There seems little chance to erase the licentiousness, the treachery, the deceit, the monstrous venality. In recalling them, however, it must always be remembered that he can only be fairly judged by the standard of his century, which was lax to a degree we can hardly comprehend, especially with reference to the first of these faults, and the last. When the American commissioners resented Talleyrand's demand for a bribe of \$250,000 for himself, and a bigger one, called a loan, for the Directory, his representative said naively: "Don't you know that everything is bought in Paris? Do you dream that you can get on with this government without paying your way?"

It must be further remembered, and to his honor, that while he betrayed her rulers, he never betrayed France. On the contrary, when he was secretly thwarting his masters he was often helping his country. On several notable occasions he rendered her service of incomparable value, and may almost be said to have saved her from destruction as a first-class European power. It was a touching, and in the main a just, eulogy pronounced on him at his death in varying phrases by both Thiers and Mignet, that he had always shown an aversion to persecutions and violence, and that he had never done harm to anybody. In the main this praise is deserved. "But," exclaims Sainte-Beuve, in protest (writing in 1867), "there are three points in his life which raise terrible doubts — the death of Mirabeau, the affair of the Duke d'Enghien, the affair of Maubreuil." This last was the alleged plot for the assassination of Napoleon.

Talleyrand was perfectly aware of the shocking charges against himself in connection with the death of Mirabeau, but he makes no ref-

erence whatever to them in the portion of his memoirs treating of that period. The fact that they were believed at the time only shows the estimate then placed on him by some of his contemporaries. On the other hand, it must be said that many things make the story improbable, and that the evidence is circumstantial, vague, and inconclusive. The second charge, to which great weight has been attached, was the alleged responsibility for the murder of the Duke d'Enghien. This Napoleon repeatedly, in conversation and in writing, fastened directly and positively upon him. Talleyrand devotes one chapter to repelling the accusation, and fixing the responsibility for the crime on Napoleon himself. As to the third charge, that of trying to have Napoleon assassinated, even Talleyrand's enemies must admit that, while some circumstances were certainly suspicious, the evidence is fragmentary and not convincing.

No portrait of the man can be just which does not relieve by many light touches the somber colors in which his countrymen have generally depicted him. He had the uniform courtesy and dignity of the old régime. He was the most accomplished of courtiers, the most correct of masters of ceremonies. He spoke well, and he wrote better — his few appearances at the Academy really being events. In the brilliant salons of the court circles before the Revolution he was a social lion. Women always liked and helped him. His witty sayings were the talk of Paris. In prosperity he was not arrogant; in times of trouble he bore himself with unruffled dignity and composure. When Napoleon denounced him in the presence of others, for treachery and venality, he merely said, as he went down the staircase, "What a pity that so great a man should have been so badly brought up." At another time when Napoleon, then First Consul, asked him how he had become so rich (he was said at this period to be worth thirty millions of francs), he replied, "Nothing could be more simple, General; I bought Rentes the day before the 18th Brumaire [the day on which Napoleon seized power], and I sold them the day after." He had taken office under Louis XVIII., and was representing France at the Congress of Vienna, when Napoleon suddenly came back from Elba. He merely discovered that his liver was a little out of order, and he must go to Carlsbad. "The first duty of a diplomat," he observed, after a Congress, "is to take care of his liver." When things went wrong, says Sainte-Beuve, he always had trouble with his liver. In fact, a few months later, after Waterloo, there were fresh symptoms of the same disease so long as Louis XVIII. regarded him

askance; but the moment he was reappointed Minister of Foreign Affairs all was well.

The harm Talleyrand did was chiefly to individuals. The good he did was to France. His public action in the Constituent Assembly was most important and in the main most judicious. The French writers of that period, and even down to the day of his death, habitually ascribed sinister motives to every act, and professed to find his hidden hand in many excesses of the Revolutionary party. But he can only be fairly judged now by what he is known to have done; and by that standard there is no Frenchman who might not be proud of his record in the Constituent Assembly. He was the pioneer in the establishment of the metric system. He opposed the issue of the assignats, and accurately foretold their end. He presented an elaborate and judicious plan for the reform of the finances and the establishment of a sinking fund. He urged the suppression of lotteries. He presented, in a comprehensive and in the main a judicious report and bill, a system of national education, including a plan for the secularization of the schools. He favored the policy of peace and alliance with England. Bishop as he still was, he presented the measure for selling the property of the clergy, and thus secured for the almost bankrupt treasury of Louis XVI. two milliards of francs. He carried the measure for abolishing the oppressive tithes of the clergy. In effect this representative of the old nobility of France showed himself among the earliest to recognize the inevitable changes, and loyally endeavored at first to introduce reforms which would enable the monarchy to adapt itself to them without too violent a wrench. As time went on he became convinced of the incapacity of the king to meet the crisis. Thenceforward he went with the tide, but strove rather to moderate and restrain it. The address to the people of France which the Assembly chose him to prepare breathed throughout a spirit of genuine and almost republican devotion to the rights of man as we now understand them.

In other and widely differing occasions his influence was exerted to promote peace, and to discourage wars of mere ambition. He faithfully warned Napoleon against his Spanish policy, and fell into disgrace for a time through efforts to thwart it. With that Spanish policy the downfall of Napoleon began. At Erfurt he protested against the scheme of wanton aggression against Austria, and even maintained private relations and had nightly interviews with the Czar Alexander to keep him from being led into it by Napoleon's importunities. At another stage in Napoleon's wild aggressions he protested, "I do not want to

be the torment of Europe." He lost his place in the Cabinet of Louis XVIII. because that king would not tolerate his plans for an alliance with England. Later on he went to England as the ambassador of Louis Philippe, and there negotiated the treaty of 1834, which secured his country many years of peace and prosperity. He rendered useful service at the peace of Amiens. At the Congress of Vienna his efforts were directed to an English rather than to a Russian alliance, and for this Thiers and others have criticized him; but there is no proof that his policy would not have resulted as well. After the hundred days, he did everything in his power to protect French property and preserve French territory.

To close this cursory recital, two other acts of Talleyrand's may be cited, which this generation should not allow to be forgotten. He proposed under the Consulate a practical system of civil service for the Department of Foreign Affairs. He was permitted to introduce it in part only, but his remarkable memorandum on the subject can be read with profit to this day. He defended the liberty of the press under Louis XVIII. against the tendency of the king and the court. Twice in the Chamber of Peers, in successive years, he faced the reaction on this subject, and exposed the fatal path on which they wished to enter.

Let us take for granted [he once said] that what has been desired, what has been held good and useful by all the enlightened men of a country, without variation, during a succession of years of various governments, is a necessity of the time. Such, gentlemen, is the liberty of the press. . . . I do not say that governments ought to hasten to recognize these new necessities. But when they have been recognized, to take back what was given, or—which comes to the same thing—to suspend it indefinitely, that is a rashness which, more than any one, I hope may not bring a sad repentance to those who have conceived the convenient but pitiful thought. You must never compromise the good faith of a government. In our days it is not easy to deceive for a long time. There is some one who has more sense than Voltaire, more sense than Bonaparte, more than any Director, more than any Minister, past, present, or to come. That is—everybody. To undertake or even to persist in a controversy where all the world is interested against you is a fault; and to-day all political faults are dangerous.

Students of current American politics are accustomed to the phrase, "Everybody is wiser than anybody." It may interest some of them to note from the above that Talleyrand said so, before the American politicians.

The forthcoming memoirs have been expected to clear up some of the dark charges against him, and to do much towards clarifying our views of that extraordinary epoch.

They are sure to leave a better impression as to the character and work of Talleyrand himself. One of his critics, Sainte-Beuve, judiciously says: "I am persuaded that everything to be found in the letters and other writings of Talleyrand will give one a more favorable idea of him. People of genius like his never put the worst of their thoughts or of their lives on paper." His relation to the murder of the Duke d'Enghien, and his treachery at one period or another of his service to almost every master he ever served, are all likely to appear in a new and more favorable aspect. He will shed a new

light on the career of Napoleon, and on the secret motives which controlled the Emperor at critical moments. He may disclose his real opinions of the religion he preached in his youth, and he will certainly disclose his real opinions about the monarchy which he helped to overturn and to reëstablish. But he will make no attempt to explain away his unfortunate relations to America, on both sides of the water, and there is no sign that he will make the slightest reference to his constant acceptance of bribes.

Whitelaw Reid.

THE MEMOIRS.¹

A STRANGE CHILDHOOD.

[THE opening volumes of the Memoirs are noticeably wanting in references to the private life and domestic associations of Talleyrand. He does, however, give some details of his neglected childhood, and with these the extracts from the first volume may properly begin.]

I WAS born in 1754; my parents had a very small fortune, but held at court a position which, if properly taken advantage of, could secure for themselves and their children the highest offices.

Louis XV. was then enjoying universal respect. The first subjects of the Crown still considered obedience to the sovereign as glorious; they did not conceive of any other power or luster than that proceeding from the king's majesty.

The queen was revered, but the very melancholy of her virtues did not prepossess people in her favor. She was wanting in those outward charms that caused the nation to be so proud of the fine features of Louis XV. Hence the mixed feeling of justice and indulgence which, on one hand, led people to pity the queen, and, on the other, induced them to excuse the inclination shown by the king towards Madame de Pompadour. M. de Penhièvre, the Maréchale de Duras, Madame de Luynes, Madame de Marsan, Madame de Périgord, the Duchesse de Fleury, M. de Souches, Madame de Villars, M. de Tavannes, Madame d'Estissac, doubtless grieved at the fact, but were then afraid of disclosing by censure what was looked upon as one of those open family secrets, that nobody dares to deny, but everybody hopes to palliate by hushing them up and behaving as though one were not aware of their existence. All the personages I have just

mentioned would have considered that they were forfeiting their honor by admitting too openly the failings of the king.

My relatives held various positions with the royal family. My grandmother was lady of the queen's household, and was treated with especial regard by the king; she always resided at Versailles, and kept no house in Paris. She had five children. Like that of all persons connected with the court, their early tuition was rather neglected, or, at least, devoted to few important branches of knowledge. As to their subsequent education, it was to consist merely in imparting to them what were termed the usages of society. Their outward appearance was prepossessing.

My grandmother had noble, refined, and reserved manners. Her piety won universal respect for her, and the fact of her numerous family caused the frequent steps she took towards securing and promoting the future of her children to be regarded as quite natural.

My father held the same views as his mother, concerning the education befitting children whose parents enjoyed a position at court. Thus mine was rather left to take care of itself; not through any indifference towards me, but owing to the special disposition of the mind which leads some people to consider that the best plan is *to do, or to be like everybody else*.

Too much care would have seemed pedantry; affection, too openly expressed, would have been regarded as quite unusual and therefore ridiculous. Children, at that time, inherited their father's *name and title*. Parents considered they had done enough for their progeny by opening a career to them, and securing for them advantageous posts; by marrying them, and increasing their allowance.

Paternal care had not yet come into fashion; the fashion was, indeed, the reverse, when

I was a child; thus, my early years were cheerlessly spent in an outlying district of Paris. At the age of four, I was still there, when I accidentally fell from the top of a cupboard, and dislocated my foot. The woman to whose care I was intrusted only informed my family of this several months afterwards. The truth became known only when my parents sent for me to go to Périgord to visit Madame de Chalais, my grandmother, who had expressed a wish to see me. Although Madame de Chalais was my great-grandmother I always called her grandmother, very likely, I think, because that name implied a closer relationship. The dislocation of my foot had been neglected too long to be remedied; even my other foot, having had to bear alone the whole weight of my body, had grown weaker, and thus I remained lame for life.

That accident had a great influence over my after-life. It, indeed, led my parents to think I was unfit for a military career, or, at least, that, in such, I should labor under great disadvantages; they were thus induced to seek for me some other profession, which, in their eyes, would be best calculated to serve the interests of the *family*. For, in great families, the *family* was far more cared for than its members individually, chiefly those young members who were still unknown. These considerations are rather painful to my mind, so I will not dwell further on them.

Madame de Chalais was a most refined and distinguished lady; her mind, her language, the dignity of her manners, the sound of her voice, were most winning. She retained what was still termed the wit of the Mortemarts; indeed, she was a Mortemart by birth.

My appearance pleased her; she acquainted me with feelings heretofore unknown to me. She was the first member of my family who displayed any affection towards me, and also the first who taught me the sweetness of filial love. God bless her for it! Indeed, I was fondly attached to her! To this day, her memory is still dear to me. Many a time have I regretted her! Many a time have I bitterly conceived how priceless is the sincere affection of some member of one's own family. Such affection affords immense comfort through the trials and troubles of life, when those who inspire it are near us. When they are away, it soothes both the heart and the mind, and enables us to collect calmly our thoughts. . . .

I am perhaps dwelling too long on those details, but I am not writing a book, I am only noting my impressions. The recollection of what I saw and heard during those early years of my life is extremely sweet to my mind. "Your name," I was daily told, "was always held in veneration in our province. Our fam-

ily," people affectionately said to me, "was at all times serving some member of yours. This piece of ground we received from your grandfather—he it was who built our church—my mother's cross is a gift from your grandmother—he who comes from a good stock cannot degenerate! You will also be kind, will you not?" I am very likely indebted to those early years for the general spirit of my conduct in life. If I displayed affectionate and even tender feelings without too much familiarity; if in various circumstances I showed pride without haughtiness; if I love and respect old people, it is at Chalais, by the side of my grandmother, that I imbibed all the good feelings which surrounded my relatives in that district, and which they enjoyed with delight. For feeling constitutes an inheritance which increases from generation to generation. For a long time to come people whose fame or fortune is of recent origin will be unable to appreciate its sweetness.

[The neglect with which Talleyrand's parents treated him, and the measures taken to drive him into the priesthood, for which he felt no inclination, stung him through life, and the bitterness he felt is shown in many passages like the following:]

I was struck with the sudden manner in which I was sent off to school without being previously brought to my father and mother. I was eight years old, and I had never yet felt my father's gaze rest upon me. I was told—and I took it for granted—that imperative reasons had caused this precipitate step to be taken. I obeyed.

Once each week I was brought home to dinner by the Abbé Hardi, and taken back to school as soon as we rose from table, after hearing on every occasion the selfsame recommendation: "Be good, my son, and give satisfaction to Monsieur l'Abbé." I worked pretty well; my schoolfellows were fond of me, and I took kindly to my new life. I had led it for three years when I was afflicted with small-pox. . . . The principal informed my people, and they sent a sedan-chair to have me conveyed to Madame Lerond, a nurse employed by the school physician, M. Lehoc, who lived in the Rue Saint-Jacques. At that time, patients attacked with small-pox were still shut up inside double rows of curtains; the windows were hermetically closed; a huge fire was lit in the room, and efforts were made to bring out the fever with very potent draughts. Many a man has been killed outright by this fiery cure; I recovered; I was not even marked. . . .

I was now in my twelfth year; during my convalescence I began musing over my situation with a feeling of surprise. The little interest that had been shown in my illness, the

fact of my having been brought to school without even an interview with my father and mother; these and other sad memories pained me at heart. . . .

No visit home was permitted me before my departure for Reims, and—let me say it once for all, and, I trust, never more think of it—I am perhaps the only man of noble birth, and scion of a large and respected family, who never experienced for one week in his life the bliss of feeling himself under the paternal roof. . . .

All the care with which they surrounded me was planned to impress profoundly upon me the conviction that, my lameness making service in the army impossible, I must necessarily enter the Church—a man of my name having no other career. . . .

No means of defense had I against this; I was alone, and all my surroundings seemed to tell me, as though with preconcerted uniformity of language, that I had no chance of escaping the plan adopted by my parents on my behalf. After a year's sojourn at Reims, seeing I could not possibly avoid my fate, I wearily gave way to it, and allowed myself to be led to St. Sulpice.

TALLEYRAND AND PARISIAN SOCIETY.

[He tells how he settled in Paris after taking holy orders, cultivated the acquaintance of people who might be useful, and went into society. But he does not tell how he secured the abbey of Périgord by sopleasing Madame du Barry with a questionable joke about the immorality of Paris that she asked the king to give him a lucrative appointment.]

I SETTLED in Bellechasse in a snug little house. My first thought was to gather the nucleus of that library which afterwards became valuable for the selection of the books, the scarcity of the editions, and the elegance of the bindings. I cultivated the acquaintance of such men as were most distinguished by their past lives, by their works, by their ambition, or by the prospects held out to them by their birth, their connection, or their talents. Placed thus, by my own act, within that vast circle where so many superior men shone with such various lights, I indulged in the proud consciousness of being indebted for what I was to no one but myself. Indeed, it was a happy moment for me when, having been appointed by the king to the abbey of Saint-Denis, at Reims, I was able to use my first year's income in handing to the Harcourt College a large portion of my fees which was still unpaid, and thus make a return to M. Langlois for the kindly care he had bestowed upon me in my early years. . . .

The cold manners, the outward show of reserve I had adopted had made some people assert that I was a clever man. Madame de

Gramont, who disliked any reputation of which she had not been the prime mover, proved useful to me, at my *début*, in endeavoring to embarrass me. It was on the occasion of my first supper at Madame de Bouffler's, at Auteuil. I was seated at one end of the table, barely venturing an occasional word with my neighbor. Suddenly, in a loud and harsh voice, Madame de Gramont calls me by my name and asks me what had struck me so forcibly, when entering the room after her, as to make me say: *Ah! Ah!*—"Madame la Duchesse," I reply, "has not heard me rightly; what I said was not *Ah! Ah!* it was *Oh! Oh!*—" My answer, poor wit though it was, raised a laugh; I went on with my supper, and said no more; but, on rising from table, I was greeted by several of the guests, and received for the following days various invitations which enabled me to make the acquaintance of persons whom I was very anxious to meet.

[The following is an exquisite portrait in miniature of one of Talleyrand's early friends.]

Nobody ever appeared to me to possess a conversational charm comparable with hers. She had no pretentiousness; her words never bore, if I may say so, any striking color; she spoke in delicate shadings; no witticism ever fell from her lips; that would have been too violent. Witticisms are remembered, whereas she only sought to please, and to let the words be forgotten. An abundant stock of facile, new, and ever delicate expressions supplied the varied requirements of her intelligence.

This lady has inspired me with a thorough aversion for people who, in order to speak the more accurately, use none but technical terms. I have no faith in the brain power, or in the science, of persons who are ignorant of equivalents, and go on for ever defining; it is to their memory alone they are indebted for what they know, and, accordingly, they know it badly. I am sorry that this remark should have occurred to me during M. de Humboldt's stay in Paris; but now it is penned, let it remain. . . .

The power of what is called "Society" in France was prodigious during the years which preceded the Revolution, and even throughout the whole of the last century. Those light and varied forms which are peculiarly its own have probably hindered our historians from noticing the origin and following up the effects of this outcome of modern civilization. I have often thought of it. The following are my views in this connection. In those countries where the origin of the present forms of government is lost to view in the mist of ages, the influence of "Society" must needs be immense. Where,

on the contrary, the constitution is but of recent date, and, consequently, still present before men's eyes, this influence is null. Thus it is, that Athens and Rome in ancient times, England and the United States of America in our own day, have had, and have, no "Society."

[He disapproved of the increasing number of literary men in society.]

Society, under Louis XV., had all the weaknesses of his reign; it opened its sanctuary, a few literary men entered. Conversation, first, and works of taste, subsequently, were benefited thereby. M. de Fontenelle, M. de Montesquieu, M. de Buffon, President Hénault, M. de Mairan, M. de Voltaire, all brought up under the influence of the century of Louis XIV., preserved in the world that mutual regard, that freedom, that noble ease, which were the charm and the fame of the Paris literary gatherings. That was the lofty standard which should have been kept up.

But, under the reign of Louis XVI., members of all the different grades of literature spread themselves through "Society." No man kept in his own place, confusion extended through the ranks, pretensions were boldly displayed and the sanctuary was violated. Then, the general tone of "Society" underwent modifications of every kind. Knowing everything, probing everything, judging of everything, was the aim of all. For sentiments were substituted philosophical ideas; for passions, the analysis of the human heart; for the desire of pleasing, personal opinions; for recreations, plans, schemes, etc.—Everything became unnatural. I say no more, for I fear I am too strongly foreshadowing the French Revolution, from which several years and numerous events still separate me.

LA FAYETTE—THE AMERICAN REVOLUTION.

[He did not like La Fayette; and he thought the true interests of France lay in cultivating close relations with Northern Africa rather than with America.]

M. DE LA FAYETTE belongs to a noble family of Auvergne, boasting of but little luster; under Louis XIV. the intelligence of a woman had brought the name into some renown.

He was born to a large fortune, and had married a lady of the house of Noailles. Had not an extraordinary occurrence drawn him out of the rank and file, he would have been ignored all his life. M. de La Fayette had not enough in himself to come to anything; for he is below the standard at which one is reckoned a clever man. In his desire to distinguish himself, as well as in the means he uses, there is something that seems taught. What he does looks as though it did not proceed from his

own self; he gives one the idea of a man following the advice of somebody else. Unfortunately no one will boast of having offered him any at the most important moment of his life. . . .

Sympathy for the cause of America was kept up in France by the report of all the deliberations of Congress, published each week by a newspaper named "Le Courier de l'Europe." This, I believe the first really political paper we ever had, was edited by a man who belonged to the police; his name was Morande, and he was the author of an infamous lampoon known as "Le Gazetier Cuirassé."

Frenchmen, brought to the colonies on military expeditions, came home with glowing descriptions of the wealth contained in the New World. America was on every lip. In my youth great lords had one peculiarity; they attributed to themselves the discovery of anything that was new to them, and the interest they felt therein increased in proportion. "*What should we be were it not for America?*" everybody wanted to know. "She gives us a navy," stated M. Malouet; "she extends our trade," the Abbé Raynal proclaimed; "she gives work to our overcrowded populations," repeated the administrators of the day; "she welcomes all restless spirits," said the ministers; "she is the refuge of all dissenters," remarked the philosophers, etc.—Nothing more useful, nothing more pacific, in appearance. There was no topic of conversation but the glory attached to the discovery of America. And yet, let us sift matters to the bottom. What has been the result of all our communications with the New World? Do we see less misery round about us? Have all our disorganizers disappeared? Have not the longing looks we have cast abroad lessened our love for fatherland? These newly discovered parts of the globe having given England and France additional points of irritation, are not wars more frequent, longer, of greater extent, and more costly? The history of mankind supplies this sad conclusion: that the spirit of strife rushes to every spot on earth to which communication is opened. . . .

When we examine the geographical situation of that solid, compact body, called France, and carry our eye all along its coast line, we cannot refrain from feeling surprised that the Mediterranean Sea has not always been considered as part of its domain. This basin, the only access to which is an opening a few miles in width, is inclosed on all sides by countries that have no considerable sea trade. France gathering by herself, and through Spain, her ally, all the resources that may be supplied by the ports of Toulon, Marseilles, Carthage, etc., ought to have in the Mediterranean any

preponderance she may choose to acquire. The immense advantages which might result therefrom have been neglected. . . .

Have we a greater interest in reëstablishing our former relations with the New World than in seeking fresh ones with the Old? It is important that this political problem should be solved. If it were proved that agriculture is less difficult and not more expensive in the Old World than in the New, that the produce is equally good, and that the great shipping interests will not be injured by the new state of things, the solution would be complete. . . .

That is the reason why, at a time in my life when I had the power to do so, I introduced into the Amiens Treaty — merely as a philosophical view, so as to give umbrage to nobody — certain points which aimed at the civilizing of the African coast. If the government had followed me up; if, instead of sacrificing all that was left of the splendid army of Egypt to the vain hope of reconquering San Domingo, this imposing and already acclimatized force had been directed against Barbary, it is probable that my philosophy would have become a practical fact, and that France, instead of destroying a fine army at San Domingo in a few months, would have established herself firmly on the African shore of the Mediterranean and would have spared us the gigantic and disastrous continental system. . . .

[Later on, in discussing the growth of the spirit of equality before the Revolution, Talleyrand shows more plainly his feeling against the French assistance to the American Revolution.]

I must repeat it once more, that portion of the army which had been so incautiously sent to the help of the American colonies struggling against the mother-country, had in the New World imbibed doctrines of equality. The men returned full of admiration for these doctrines, and perhaps with a desire to put them in practice in France; and, by a kind of fatality, this was the very time hit upon by Maréchal de Ségur to reserve for the nobles all the officers' posts in the army.

[Talleyrand's enemies have denied that his rapid promotion in the Church, before the Revolution, was crowned by an actual offer to the young man of a cardinal's hat. Here is his own account of it, following his story of loss of favor at court.]

I look back on that period of my disfavor at court with greater pleasure than on many fortunate situations in which I have been in my life, and which have left no trace, either in my mind or in my heart. Hardly do I still remember that the queen would not let me have the benefit of a very gracious act of Gustavus III., who had obtained a cardinal's hat for me from Pope Pius VI. She desired M. de Mercy to induce the Vienna court to oppose

the appointment of a French cardinal before the promotion of the crowns. Her wishes were complied with; the papal appointment was suspended; and, since then, my cardinal's hat is likely to have spent a few years in French fortresses.

BEGINNINGS OF THE FRENCH REVOLUTION.

[His account of his part in the Constituent Assembly is brief and almost apologetic. He wanted to resist the movement; failing in this, he wanted to make the best of it. He scarcely speaks of his brilliant personal successes, or of his presidency, but does speak of his devoting the last exercise of his religious functions to the service of the Revolution.]

I WAS a member of the delegation of the order of the clergy. My opinion was that the States-General should be dissolved, and then convoked again according to certain plans. I suggested it to the Count d'Artois who, at that time, showed me a certain amount of kindness, nay—if I dare use his own expression—of friendship.

My idea appeared too hazardous. It was an act of violence, and there was no one about the king able to make use of violence. I had several appointments by night at Marly; but all of them having proved fruitless, the conviction was forced upon me that I could do no good, and that, such being the case, I should be a madman if I did not think of my own self.

The composition of the States-General evidently rendering null the first and the second orders,¹ there was but one rational course open—to yield before we were compelled to do so, and while we might yet claim credit for our action. Thereby we might prevent things being carried to extremities; we imposed a certain regard for us on the third estate; we preserved the means of influencing the common deliberations; we gained time—which frequently means gaining everything—and if we had any chance of reconquering lost ground, this was the only course that presented it. I therefore felt no hesitation in joining those who set the example in this direction. . . .

I resolved, accordingly, not to leave France before I was driven away by personal danger, not to do anything to provoke this danger, not to struggle against a torrent which it was impossible to stem; but to keep within reach and in a position to help the saving of what could be saved; not to raise any obstacle between the opportunity and myself, and to reserve myself for the opportunity.

The deputation of the third order, before its triumph over the two others, had been busy drafting a declaration of rights similar to that which the American Colonies had drawn out

[¹ The three orders were the nobility, the clergy, and the people.]

when they had proclaimed their independence. This declaration continued to be discussed after the fusion of the orders. It was but the development of a theory of equality. . . . Those who had the keenest presentiment of its ravages were reduced to playing, as far as prudence permitted, a passive part in the proceedings.

That is what I did generally. Still, I thought it my duty to speak on several questions of high finance. I opposed the creation of assignats, the reducing of the interest of the public debt. I laid down, somewhat fully, the principles on which, in my opinion, a national bank should be founded. I proposed the decreeing of a uniform standard of weights and measures. I likewise took charge of the report of the Constitutional Committee on public instruction. For the proper carrying out of this great work, I consulted the most learned men, the most noted savants of the period — a period boasting such men as M. de Lagrange, M. de Lavoisier, M. de la Place, M. Monge, M. de Condorcet, M. Vicq d'Azir, M. de la Harpe. All came to my aid. The reputation which this work has acquired demands that I should name these men.

One circumstance presented itself in which, in spite of all my repugnance, I deemed it necessary to come to the fore. These are the motives by which I was urged.

The Assembly claimed to regulate, of itself and by civil law, that which hitherto had been regulated only by the concurrence of the spiritual and the temporal powers, and a blending of canon and civil laws. It planned a special constitution for the clergy, and required that all ecclesiastics in office should take an oath of compliance with it, under penalty of being considered as having resigned their functions. Most of the bishops declined to do so, whereupon, their sees being held vacant, the electoral bodies appointed successors to them. The new elects would readily have done without the "institution" granted by the court of Rome, but they could not do without the episcopal character which could be conferred upon them only by men who had received it themselves.

Had there been no one to confer it on them there would have been every reason to apprehend, not the proscription of every kind of worship (which came to pass a few years later), but an eventuality which struck me as more dangerous because it might be more lasting; and that was, that, through the doctrines it had sanctioned, the Assembly might soon drive the country into Presbyterianism (more in accordance with the then prevailing opinions), and that it might become impossible to bring France back to Catholicism, the hierarchy and external forms of which are in harmony with those of the monarchical system. I therefore

lent my assistance to consecrate one of the bishops elect, and he, in his turn, consecrated the others. That being done, I resigned the bishopric of Autun, and thought only of leaving the career I had hitherto followed; I placed myself at the disposal of events; provided I remained French, I was ready for anything.

The Revolution held out fresh prospects to the nation; I followed her in her progress, and went through its vicissitudes. I offered her the tribute of all my abilities, determined as I was to serve my country for its own sake, and I founded all my hopes on the constitutional principles which we thought we were so near attaining. This explains why and how, several times over, I entered, left, and reëntered the world of public affairs, and it accounts also for the part I played therein.

[But Talleyrand makes no mention of his share in the famous celebration of the 14th of July, 1790, on the Champ de Mars, when, in his capacity of Bishop of Autun, he officiated at the altar, in the presence of the immense crowd, before swearing the multitude to allegiance to the new constitution. Bastide, author of a French life of Talleyrand, which appeared within a few years after his death, recites that, at the very moment of mounting the altar, Talleyrand turned to the Commandant of the National Guard, General La Fayette, with the words: "Come, now, don't make me laugh." There is a letter published by the same author, written by Talleyrand on the 15th, to his friend, the Comtesse de Flahaut. In this he calls the solemn religious ceremony "Yesterday's ridiculous fête," and quotes Sieyès as having asked him, in the presence of sixteen persons, with a sardonic smile, how he was enabled to keep a sober face in executing his dexterous buffoonery on the Champ de Mars, and how many Christians he believed there were among the hundred thousand spectators who received the national and Christian oath. After saying that he professed ignorance in his reply to Sieyès, he adds: "I share the opinion of Voltaire, whether we ourselves believe in a God or not it would be dangerous for all society that the multitude could think that, without punishment in this world, and without fear of chastisement in the other, it could steal, poison, and assassinate." And then he continues: "I hope that your penetration has not failed to make you feel to what divinity I yesterday addressed my prayers, and my oath of fidelity. You alone were the Supreme Being whom I adore, and always will adore." The rest is simply a love-letter of a rather bold character.

In beginning his account of the Constituent Assembly, Talleyrand speaks of his consultation with the Count d'Artois. M. de Bacourt gives in a footnote the following account of this effort by Talleyrand to induce the younger brother of Louis XVI. (afterwards Charles X.) to influence the king to more decided measures, and how, when Louis XVIII. was coming to the throne, Talleyrand reminded him of the interview:

"The most important, and the last, of these interviews took place at Marly during the night from the 16th to the 17th of July, 1789, that is to say a

few hours before the prince left France. When M. de Talleyrand presented himself at the residence of the Count d'Artois, the latter was already in bed; he admitted his visitor, however, and there, during two hours' conversation, M. de Talleyrand again explained all the dangers of the situation, and entreated the prince to lay them before the king. The Count d'Artois was moved at this intelligence; he got up, repaired to the palace, and returning after a pretty long absence declared to M. de Talleyrand that there was nothing to be done with the king, determined as he was to give way rather than to have one drop of blood shed through his resistance to the popular movements. 'As to myself,' added the Count d'Artois, 'my mind is made up; I am off in the morning, and will leave France.'

"M. de Talleyrand vainly besought the prince to give up such an intention, and pointed out to him the inconveniences and dangers it might have for him in the immediate present, and for his rights and those of his children in the future. The Count d'Artois was obstinate, and in the end M. de Talleyrand said to him: 'In that case, Monseigneur, there is nothing now left for each one of us but to think of his own interests, since the king and the princes desert theirs as well as those of monarchy.' 'Quite so,' replied the prince; 'that is what I advise you to do. Whatever may happen, I can never blame you; always reckon on my friendship.' The next morning the Count d'Artois emigrated.

"In the month of April, 1814, it befell to M. de Talleyrand, as president of the Provisional Government, to announce to Count d'Artois (who was then awaiting events at Nancy) that Louis XVIII. was called to the throne, and that the prince himself was invited to come to Paris and assume the reins of government in the capacity of lieutenant-general of the kingdom. He entrusted this mission to the Baron de Vitrolles; and, pacing up and down with him the first floor of his residence in the Rue Saint-Florentin, while the prince's dispatch was being sealed, he related the above conversation to him, adding the request: 'Pray do me the pleasure to ask the Count d'Artois if he remembers this little incident?'

"M. de Vitrolles, after fulfilling his important mission, did not fail to communicate M. de Talleyrand's query to the prince. 'I have a distinct recollection of the occurrence,' answered the Count d'Artois; 'M. de Talleyrand's account of it is accurate in every point.'"]

THE DUKE OF ORLEANS — ORIGIN OF THE REVOLUTION.

[Talleyrand paints a terrible picture of the Duke of Orleans, grandfather of Louis Philippe, and great-grandfather of the Count of Paris. He seems to have been intimate with him before and during the Constituent Assembly, and he describes him as "destitute of ability, ignorant to the verge of illiteracy, without heart and without principle. All his actions had the characteristics of thoughtlessness, frivolity, and trickery." In this sketch, for the first time, occurs a significant gap, for which the editors offer no explanation, excepting that—"Here eight pages are missing in the manuscript."]

In 1788, after a friendship of twenty-five years' duration, he displayed the most heartless

indifference at the death of one of his principal *habitués*, the Marquis de Conflans, a man always remarkable, first by his handsome cast of features, his noble bearing, his gait, his skill, and also by his faults when he kept evil company, by his qualities when he was among military men, by the accuracy of his judgment when he spoke on serious matters and, at every period in his life, by the frankness of his tastes, his feelings, and his hatreds. M. de Conflans, afflicted with a lingering disease which was fated to have a sudden termination, would not believe that he was ill, and went about in the world as usual. On the day of his death, he was to dine, with the Duke of Orleans and several others, at M. de Biron's, at Montrouge. They were all waiting for him—the Duke more impatiently than the rest, as he wanted to go to the theater. At four o'clock, the company being all together, one of M. de Conflans's servants arrived with the news that he had just died. Every person in the room, according to his more or less intimate acquaintance with M. de Conflans, expressed his sympathy. The only words the Duke of Orleans pronounced were: "Well, Lauzun, as we are no longer expecting any one, let us go on with our dinner so that we can get to the opera in time for the beginning."

[And here is Talleyrand's conclusion as to the Duke of Orleans, and as to who were the authors of the French Revolution.]

After the instructions he gave to his bailiwicks, the Duke of Orleans ceased to be an active political personage; his weak character and his equivocal, disquieting position were obstacles to his becoming one again. After the crime he committed by his vote, he was henceforth without purpose or aim—a nobody; he remained in the rank and file, and as that was not his place, he became a non-entity, a degraded being, a dead man.

What now becomes of the opinion, so loudly asserted, that the Duke of Orleans was the author of the Revolution; that his name served as a rallying standard for a large number of citizens; that he was urged by the ambition of a few restless minds to turn his views to the throne itself? This opinion cannot be maintained in the face of his actual life. For immorality, extreme frivolity, want of thought, and weakness are quite sufficient to explain his moments of activity as well as his fits of inaction. Moreover, the impulse having once been given, the rapid and violent movement of the public mind left no room, at any period in the Revolution, for the development of individual ambitions. As all thoughts, from the very start, verged towards the establishment of equality and the weakening of power, high personal ambitions were necessarily discon-

certed. Much later only, and after terrible ordeals, did the need of a chief begin to be felt, who would modify the existing state of things; it was then that Bonaparte appeared.

The Duke of Orleans could not possibly have been the last man to observe the tendency I have just alluded to; and accordingly the real aim of his ambition has always remained open to doubt. He was, as I said, neither the principal, nor the object, nor yet the motive of the Revolution. He, like all the rest, was carried along by the raging torrent.

The Duke of Orleans began to turn his attention to himself, his own tastes, his wants. Thence sprang the secret thought which made him consent, after the 6th of October, 1789, to undertake the shameful trip to England which all parties have reproached him with. It is from that time that may be dated the dwindling of his immense fortune; which, being more easily convertible, left still fewer traces than the splendid picture gallery of the Palais Royal, now scattered so far and wide. All the available funds of the Duke of Orleans found their way to England by underhand means, and through secret agents who, thanks to their obscurity, may have been dishonest and quietly enjoyed the proceeds of their dishonesty. Such is the opinion of the men who were then at the head of affairs.

Should historians ever puzzle themselves to find out the men to whom they can attribute the honor or the blame of having started, or directed, or modified the French Revolution, they will give themselves very needless trouble. It had no creators, no leaders, no guides. The seeds were sown by the writers who, in an enlightened and enterprising age, when aiming a blow at prejudices, upset religious and social principles, and by the unskilled ministers who increased the deficit of the treasury and the discontent of the people.

[The time was now come when the prudent spirit of Talleyrand sought a refuge from the impending storm. A few extracts show the English experiences to which this purpose led, and his feeling about the bloody drama enacted in his own land, which he watched from the English coast.]

What was left of the royal prerogatives after the vote of the Constituent Assembly was but a shadow, growing fainter daily. It was, therefore, of paramount importance to save from further ruin the frail power of the king, which all efforts made in view of restoring to it its lost reality only tended to diminish. The men who still affected to be afraid of it, such as it was, only sought a pretext to complete its destruction. The great point would have been not to have offered them any. They were not satisfied that the king should imitate the reed, that withstands the fury of the wind, simply

because it is incapable of offering any resistance to it: they wished his supporters both at home and abroad to remain in utter inaction, and to abstain from expressing any opinion he might have been accused of sharing. But who could be induced to adopt such a spiritless policy? The revolutionary impulse had been given and stirred all classes.

The cabinet of the time, of which M. Necker was no longer a member, then understood the necessity for royalty to obtain from the chief courts of Europe the promise that they should either disarm or not arm at all. The leaders of the second Assembly, known as Girondists, had insisted on this step with the belief that the king's ministry would decline to take it. Their hopes were deceived. M. de Lessart, who was then Minister of Foreign Affairs, took up that suggestion, and proposed that I should go to England in order to open negotiations on the subject. I was anxious to leave France for some time; I was tired and disgusted, and, though I felt sure that my mission had little chance of success, I accepted. The king wrote to the king of England a letter of which I was the bearer. . . .

At that stage, it was no longer a question whether the king should reign, but whether he himself, the queen, their children, his sister, should be saved. It might have been done. It was at least a duty to attempt it. At that time France was only at war with the Emperor, the Empire,¹ and Sardinia. Had all the other states concerted in offering their mediation by proposing to recognize whatever form of government France might be pleased to adopt, with the sole condition that the prisoners in the Temple should be allowed to leave the country and retire wherever they liked — though such a proposal, it may be supposed, might not have filled the demagogues with delight, they would have been powerless to reject it.

So little were the demagogues inclined to general hostilities, that they hastened to make pacific declarations to all the governments with which France was still at peace. Indeed, very few amongst them thirsted for the blood of Louis XVI.; and if they shed it afterwards, that was owing to reasons not one of which would have existed had Europe taken the course indicated above. The royal family might therefore have been saved. A war of twenty-two years might have been prevented.

TALLEYRAND IN ENGLAND.

AFTER August 10, 1792, I solicited from the provisional executive a temporary mission to

[¹ The Emperor of Austria was the head of the Holy Roman Empire, of which the German States were an integral part.]

London. As the object of my mission I chose a scientific question with which I was somewhat entitled to deal, seeing that it related to a motion previously made by me in the Constituent Assembly. The point was to establish for the whole kingdom a uniform system of weights and measures. When the exactitude of that system should have been ascertained by the most competent men of Europe, it might subsequently have been adopted by the different nations. It was therefore advisable to confer with England on the subject.

My real object was, however, to leave France, where it seemed to me useless and even dangerous to stay any longer, but I only wished to leave the country with a regular passport, in order that it should not be shut to me for ever. . . .

I resided in England during the whole of the dreadful year 1793, and a portion of 1794. There I was welcomed with the utmost kindness by the Marquis of Lansdowne, whom I had known in Paris; he was a nobleman of lofty views, gifted with abundant and lively powers of elocution. He was still free from the infirmities of old age. Some people brought against him the commonplace accusation of being *too clever*—an accusation by means of which, in England as well as in France, people keep at a distance all the men whose superiority gives them umbrage. That is the only reason why he never was in office again. I saw him often, and he kindly sent me word every time he received the visit of some distinguished person of whom he thought I should be pleased to make the acquaintance. It was at his house that I met Mr. Hastings, and Doctors Price and Priestley. There also I formed an intimacy with Mr. Canning, Mr. Romilly, Mr. Robert Smith, M. Dumont, Mr. Bentham, and Lord Henry Petty, the son of Lord Lansdowne, who at that time was already looked upon as one of the hopes of England. All the friends of Mr. Fox, with which gentleman I had, on several occasions, been on intimate terms, did their best to render my stay in London as pleasant as possible. . . .

My absence from France during the most terrible years of the Revolution left me in ignorance of the details of its dreadful events; scarcely could I, at that distance, discern their broad outlines. On the other hand, I too often turned away from those hideous scenes, in which so much abjectness was mingled with so much fierceness, to be able to depict them. The reign of Henri IV. and that of Louis XIV. are known to us in all their details, but these recent events appear confused and problematic even to the very men who played a part in them; they followed each other with such rapidity that each in turn

almost stamped out the recollection of what occurred before. Perhaps also the mob leaves too slight an imprint on what it does; its deeds have but a transient effect, and the character of the men who serve it is such as to make no impression on one's memory. Having lived in obscurity until such day as they appear on the scene, to obscurity they return as soon as their part is played.

I confess that it would not cause me the slightest concern if the details of that awful calamity were to leave no trace in men's minds, for they are of no historical importance. Indeed, what teachings could men derive from deeds performed without aim or plan, and which were merely the outcome of ruthless and unruly passions?

Instruction of every kind is rather to be sought in the knowledge of the facts preceding the catastrophe, and for the investigation of which every material exists; that knowledge will disclose the numerous and weighty causes of the Revolution. . . . The study of those already distant days possesses, methinks, the invaluable advantage of cautioning us against every form of intolerance. When considering the last twenty years of the old monarchy, there is no man of any elevation of mind and good faith who, on remembering what he did or said, what he wrote, what he blamed or approved, will not find some fault with himself—if that man possessed any influence at all: I might almost add that no one knows all the examples—good or bad—he must have set. I thus deny that it is in the power of any of the men I have known, whether princes or simple subjects, to decline all share of responsibility in the subsequent outbreak.

[Talleyrand tells very briefly his expulsion from England, and at the moment of setting out for America gives a pitiful glimpse of a certain well-known American.]

It was not my intention to stay long in England. Though being nominally an outlaw in France, I yet did not wish to place myself in the category of *émigré*, which I really was not. However, the English Foreign Minister thought it advisable to emphasize his zeal for the general cause by displaying at first his antipathy towards the *émigrés*. With that object he availed himself of the alien bill, which he had wrenched from Parliament, to send me orders to leave the country within twenty-four hours. Had I acted on the first impulse, I should have started off at once, but my dignity required of me to protest against the unjust persecution of which I was the victim. In consequence, I applied to Mr. Dundas, to Mr. Pitt, and to the king himself; being unable to obtain satisfaction in any quarter, I had but to submit, and therefore went to sleep on board

a ship which, I had been told, was the first to start for the United States. . . .

On the second day of our voyage, just after having left the Thames, we met with a violent storm. I was then between England and France—a most critical situation. I could see France; there my head was in danger. Though I ran no immediate risk by returning to England, it would have been repugnant to me to solicit the hospitality of a government which had tried to injure me.

Fortunately the danger we were running was noticed on shore, and induced some Falmouth lightermen to brave the fury of the sea and come to our assistance. With their help, we managed to reach the harbor. Whilst our ship—all the rigging of which was much damaged—was being repaired, a rather striking incident added an impression of a special kind to the many I was to experience in the course of this voyage. The innkeeper at whose place I had my meals, informed me that one of his lodgers was an American general. Thereupon I expressed the desire of seeing that gentleman, and, shortly after, I was introduced. After the mutual exchange of greetings, I put to him several questions concerning his country, but, from the first, it seemed to me that my inquiries annoyed him. Having several times vainly endeavored to renew the conversation which he always allowed to drop, I ventured to request from him some letters of introduction to his friends in America. “No,” he replied, and, after a few moments of silence, noticing my surprise, he added, “I am perhaps the only American who cannot give you letters for his own country,—all the relations I had there are now broken,—I must never return to the States.” He dared not tell me his name. It was General Arnold! I must confess that he excited my pity, for which political puritans will perhaps blame me; but I do not reproach myself, for I was a witness of his agony.

TALLEYRAND IN AMERICA.

WE had been sailing for several weeks, when one morning, the word I feared, “Land! Land!” loudly shouted by the people on board, roused me from my sleep. The captain, the crew, and the passengers, all displayed the most lively joy. On reaching the deck, I saw the pilot who was to take us up the Delaware, and, at the same time, I noticed an outboard ship steering round the headland. Having ascertained from our pilot that the other ship was bound for Calcutta, I immediately despatched a boat to her captain, in order to inquire whether he had room for one more passenger. The ship’s destination was of no consequence to me; she was going on a long

voyage, and my object was, if possible, to avoid landing. Unfortunately, the captain being unable to accommodate me, I had no choice left but to submit to be taken to Philadelphia.

[He stayed for a short time in Philadelphia, encountering there a Dutchman, whom he had known in Paris, Mr. Cazenove; and he subsequently found other Dutch and French friends. With some of these he made a journey into the interior.]

Only twelve years had elapsed since the United States had ceased to be a colony, and the years of their independence had been lost for their prosperity, owing to the inefficiency of their first Constitution. The bases of public trust not having been properly defined, a paper money more or less discredited roused everybody’s cupidity, encouraged bad faith, disturbed all transactions, and caused the institutions necessitated by the recent independence of the country to be lost sight of. It was only in 1789, at the time of the new Federal Constitution, that property in the United States began to rest on truly solid foundations, that social guarantees securing the safety of foreign intercourse were shaped, and that the government of the young nation was admitted to rank with older powers. That is the true date of the foundation of the United States. . . .

Intending to tire myself I made up my mind to leave Philadelphia, and thus proposed to M. de Beaumetz and to a Dutch gentleman, of the name of Huidekoper, to travel with me inland. They both accepted, and I must confess that from the beginning I was pleased with the undertaking. I was struck with astonishment. Less than a hundred and fifty miles distance from the capital, all trace of men’s presence disappeared; wild nature in all its pristine vigor confronted us; forests old as the world itself; decayed plants and trees covering the very ground where they once grew in wildness; others shooting forth from under the *débris* of the former and like them destined to decay and rot; thick and intricate bushes that often barred our progress; green and luxuriant grass decking the banks of rivers; some large natural meadows; some strange and delicate flowers quite new to me; and here and there the traces of former tornadoes that had carried everything before them. Enormous trees all mowed down in the same direction, extending for some considerable distance, bear witness to the wonderful character of those terrible phenomena. . . .

Agriculture is the basis on which all states are founded. It is this,—I say it with all economists,—that forms the chief wealth of the social state, that teaches the respect of property, and warns us that we are blind to our interests

whenever we interfere with those of other people. . . .

The American government allowed itself too easily to be influenced by the geographical situation of the States; it gave too much encouragement to the spirit of enterprise, for, in order to increase its population, America annexed Louisiana; it will now be obliged to annex the Floridas. Commerce requires ports and harbors from Sainte-Croix River, near the Saint-Lawrence, to the Gulf of Mexico, yet nine-tenths of the five hundred millions of acres composing the territory of North America are still untilled. Too much activity is devoted to business, and not enough to farming; and that first direction given to all the ideas of the country unsettles its social establishment. You need only travel hardly a hundred miles inland to see, in the same spot, people paying in kind for whatever they buy, whilst others draw bills on the first markets of Europe: the contrast is really too shocking; it is the symptom of a social disease.

I saw, sixty miles from Boston, six thousand feet of timber exchanged for a bullock, and in Boston itself twenty pounds paid for a Florence straw hat.

At Frenchman's Bay, on the border of the Eastern States, a violent storm having compelled me to stop at Machias, I questioned the man at whose house I was staying. That house was indeed the best in the district, and, as people say in the country, the landlord was *a most respectable man*. Having exhausted the chapter relative to the value and price of land, I asked him whether he had ever been to Philadelphia. He replied that he had not yet done so. He was a man of about forty-five years of age. I scarcely dared to ask him whether he knew General Washington. "I have never seen him," he said. "If you should go to Philadelphia," I went on, "you will be pleased to see the great man?" "No doubt I shall, but," he added with beaming eyes, "I should very much like to see Mr. Bingham, the man who they say is so rich."

Throughout the States I met with similar love for money, and often as coarsely expressed. This country is too soon acquainted with luxuries. The latter are, indeed, shocking when men can hardly provide themselves with the necessities of life. I recollect having seen, in the drawing-room of Mrs. Robert Morris, the hat manufactured in the birthplace of the master of the house, carefully laid on an elegant Sèvres china table, bought at Trianon by some American. Hardly would a European peasant have consented to wear such a hat.

On the banks of the Ohio, Mr. Smith possesses a residence known in the country by the name of *log-house*. The walls of it were formed with rough trees. The drawing-room

contained a pianoforte enriched with most beautiful bronzes. M. de Beaumetz, having opened it, Mr. Smith said to him: "Please do not attempt to play on it, for the man who tunes it lives a hundred miles from here, and he has not come this year."

TALLEYRAND AND HAMILTON.

[The above is almost, or quite, the only reference Talleyrand makes to Washington. The explanation is simple. Talleyrand was armed with an extremely cordial letter of introduction to Washington from Lord Lansdowne, telling how he had sacrificed his ambition in the church to public principle, eulogizing his moderation, and attributing his exile to the wish of courts, which can never pardon in a bishop a desire to promote the general freedom of worship. In spite of this appeal, Washington flatly refused to receive him, and Talleyrand never forgot, or forgave it. He saw much, however, of Hamilton who was very kind to him, and of whom he always spoke, during his after life, in terms of the utmost admiration.]

DURING the two winters I spent either in Philadelphia or in New York, I availed myself of the opportunity thus afforded me to see the chief personages whose names the American Revolution gave to history — especially General Hamilton, whose mind and character placed him, I thought, on a par with the most distinguished statesmen of Europe, without excepting Mr. Pitt and Mr. Fox.

As remarked above, I had noticed, whilst traveling in the States, that agriculture was less encouraged than commerce, that, having to choose between two sources of prosperity, government had caused the scale to fall in favor of commerce, and, still recently, emphasized its intention by adding to all the real wealth of their country the fictitious one procured by all the banking establishments which have sprung up everywhere in the States, and serve exclusively the ends of commerce. Such direction, once adopted, vanity and cupidity could not help soon to denounce wisdom, moderation, or simple probity, as narrow views. By upsetting the barriers formerly raised by the metropolis which centralized on its markets all the products of its colonies, and set its own rules to their speculations, the United States take able advantage of the position and power their independence obtained for them. They send to all the markets of the Old World unexpected quantities of all sorts of goods, which, by altering prices, bring about commercial crises impossible to avoid. The chief cause of all those perturbations proceeds from the great distance existing between the eastern and southern ports of the States, whence thousands of ships loaded with similar products start every year, on almost the same day, bound for all the ports of

Europe. Thus will, for a long time to come, the commerce of America with Europe be left to chance. . . .

All these considerations make it most difficult to foresee the future, and well-nigh impossible to direct its course. Yet everything seems easy to a man driven from his country and obliged to put up at an inn or reside in indifferent lodgings: not so to him who is quietly seated under his own roof. I then took advantage of the disposition in which my narrow quarters placed me to indulge myself in high politics, and set the world to rights. . . . I even fancy that I was on the very point of applying the system of the economists to free trade and the abolition of customs, which must needs be comprised in my speculative ideas, when, at the very moment I was engaged in trying to solve the problem, a new customs-tariff, adopted by the American Congress, on the motion of my friend Hamilton, came into force. The early conversations I had with him dwelt on that branch of the American administration. "Your economists," he said to me, "invented a beautiful dream; it is the chimerical exaggeration of people whose intentions were good. Theoretically," he added, "their system might perhaps be contested, and its unsoundness be exposed; but we must leave them their sweet illusions; the present state of affairs of this world suffices to prove that, at least for the nonce, their plan cannot be carried out; let us be satisfied with that fact." I did not make a very firm stand in favor of the economists, yet I could scarcely make up my mind to abandon the idea that there could exist some generous combinations that would result in mutual advantages for all commercial nations. Philanthropic ideas rush to the mind when one is an outlaw.

Mr. Hamilton did not seem to me to reject so peremptorily the possibility of all industry being, some day, divided in a permanent way between all the nations of the world.

Europe, I said to him, is acquainted with and cultivates all branches of art, and excels in the manufacture of all articles of luxury, as in everything that tends to make life more pleasant and agreeable. The New World possesses a kind of wealth peculiar to it: its crops will always surpass in quantity those of any rival nation.

Might not, therefore, the distribution of those two modes of applying men's abilities serve, at least for a considerable time to come, as the measure and basis of the relations that must necessarily spring up between nations, some of which daily require to buy, at a moderate cost, the most usual necessities of life, whilst

others are anxious to acquire all that tends to make life more pleasant and sweet?

Might not that natural balance furnish a vast ground for intelligent exchange, which, being ruled by international conventions, would constitute the commercial intercourse of the different powers?

"Your idea," Mr. Hamilton said to me, "will only be practical the day when—and it is perhaps not very remote—great markets, such as formerly existed in the Old World, will be established in America.

"You have four chief markets concentrating all the products of the world: that of London, which, notwithstanding our commercial successes, will yet be the first for a long time to come; that of Amsterdam, which, if things do not mend in Holland, will soon be removed to London; that of Cadiz, which will eventually pass into the hands of our northern or southern ports; and that of Marseilles, which owed its flourishing state to Levantine trade, but is now on the eve of being lost to you Frenchmen.

"As for us, we only need two markets, but they are indispensable to us: one for the North-east and one for the Southern States.

"When those large markets are established, commerce will be able to resume its regular course; commercial enterprise will no longer rely on mere chance, it being the interest of each market to publish the real price and quality of the various goods that find their way to it; excessive fluctuations will be thereby avoided, thus keeping within reasonable bounds the losses and gains of all speculations. Then will sailors of all nations bring in confidence their cargoes to the various ports of the world."

I admired the large-mindedness always apparent in the private views expressed by Mr. Hamilton respecting the prosperity of his country. I do not know whether they will ever be realized, but, if they are, it will only be when the American desire to encroach and invade will have ceased to alter the general relations of the American people with other nations, and when, by a judicious regard for its own interests, it will endeavor to conquer its own country by turning to every possible advantage the vast extent of territory belonging to it.

I had acquainted myself with almost all I wanted to know in America; I had been spending nearly thirty months in that country, without any other aim than that of being away from either France or England, and impelled by the sole interest of seeing with my own eyes the great American nation whose history is only beginning.

PIONEER SPANISH FAMILIES IN CALIFORNIA.

WITH SPECIAL REFERENCE TO THE VALLEJOS.

DON ARTURO BANDINI IN THE OLD SPANISH RIDING DRESS OF HIS FATHER.

THE most attractive literary material left in California is to be found in the recollections and traditions of descendants of the pioneer Spanish families. But these men and women must be met with sympathy for their misfortunes, and with an unfeigned interest in the old ranch and Mission days. As soon as their confidence is fairly won they tell all they know, with almost childlike eagerness to

help in the restoration of the past. One immediately observes the great stress laid upon family connections, the pleasure taken in stories of former times, and the especial reverence for the founders of the province, the governors and other officials, and the heads of the Missions. Politics, though of course on an extremely small scale, occupies a large part of the recollections of the older men, and the animosities of the petty revolutions of half a century ago, of the years just before the American conquest, and of the conquest itself, still divide families from each other. A glance at the subjoined list of the governors of California will show the reader how closely united were the social and political features of the life of the province. At first the governors had much power; the great families were hardly established in their almost feudal relations to the soil; and the long terms of office,—fourteen years in one case,—and the peaceful progress of events, show that it was the age of settlement. As the Mexican revolution of 1835 approached the Californians grew restive and gave their governors more and more trouble; at last every noted *ranchero* family had a different candidate for the governorship, and that "year of revolutions," 1836, saw four successive occupants of the office. Picos, Castros, Alvarados, and a dozen other families, with

THE CAMULOS RANCH,—THE SCENE OF H. H.'S "RAMONA,"—ABOUT TWENTY-FIVE MILES FROM SAN BUENAVENTURA.

DON JUAN B. CASTRO.

their adherents and relatives, were struggling for social and political supremacy.¹

The great families of the Spanish pioneer period have mostly representatives at the present day; some of them have retained wealth and influence, especially in the southern counties. Don Romualdo Pacheco, whose mother was Ramona Carrillo, became State senator, lieutenant-governor, and one of the leaders of the Republican party. The grandson of Captain Antonio del Valle, who came from Mexico to California in 1819, is now one of the most prominent politicians in the State. Don Juan B. Castro has held many offices of trust and profit in Monterey County. Don Ignacio Sepulveda, a thoroughly educated lawyer, married an American wife, and was long a superior judge in Los Angeles. A number of similar cases might be mentioned in which individuals of the conquered race have found their opportunity in the material development of the Pacific coast. Still, these were but exceptions; most of the old families sank into obscurity, and it is now difficult to trace their connections. Only about thirty Spanish families of California have retained any wealth or influence.

Among the families of the first rank as regards wealth, influence, dignity, and pride of birth were the Castros, Picos, Arguellos, Bandinis, Carrillos, Alvarados, Vallejos, Avilas, Ortegas, Noriegas, Peraltas, Sepulvedas, Pachecos, Yorbas, and their numerous connec-

tions. The Estradas, for instance, were relatives of the Alvarados, and Don José Abrego, of Monterey, treasurer of the province from 1839 to 1846, married an Estrada. This made the Abregos allies of the Alvarados. Don José's son married a daughter of Jacob P. Leese, the American, son-in-law of General Vallejo; his daughter married Judge Webb of Salinas: the Alvarado-Vallejo connection had drawn the Abregos towards the Americans. The founder of the Alvarado family was Juan B., a settler of 1769, whose son José was sergeant at Monterey, and whose grandson was the governor. The mother of the governor was Maria Josefa Vallejo; his wife was Martina Castro. The founder of the Arguello family was Don José Dario, who arrived in 1781; his wife was a daughter of the Moragas, and their children intermarried with the best families of the province. One daughter was the famous Maria de la Concepcion Marcela, born in 1790, and remembered because of her romance, of which Bret Harte has told the story. There is little to add to the outlines of the poem, except that the tale of the lady Concepcion Arguello is familiar to all the Spanish families, and one often hears it used to illustrate the "simple faith of the ancient days." One of the ladies of the Vallejo family retired to a convent. The lady Apolinaria Lorenzana, of Santa Barbara and San Diego, whose lover died, devoted her

DON MANUEL CASTRO.

life to teaching and to charity, and was known for half a century as "*La Beata*," to whom all doors were open and all sorrows brought. She

¹ The Spanish and Mexican governors of California and the dates of their accession were as follows: Gaspar de Portola, 1767; Felipe de Barri, 1771; Felipe de Neve, 1774; Pedro Fages, 1782; José Antonio Romén, 1790; José J. de Arrillaga, 1792; Diego de Borica, 1794; José J. de Arrillaga, 1800; José Dario Arguello, 1814; Pablo

Vicente de Sola, 1815; Luis Antonio Arguello, 1823; José Maria de Echeandia, 1825; Manuel Victoria, 1831; Pio Pico, 1832; José Figueroa, 1833; José Castro, 1835; Nicolas Gutierrez, 1836; Mariano Chico, 1836; Nicolas Gutierrez, 1836; Juan B. Alvarado, 1836; Manuel Micheltorena, 1842; Pio Pico, 1845.

planted the famous grapevine of Montecito, long known as the largest in the world, and bearing six thousand clusters in a single season.

PIO PICO, GOVERNOR OF CALIFORNIA IN 1845.
(FROM A PHOTOGRAPH BY BUTTERFIELD & SUMMERS.)

There were other women as worthy of saintship, of whom the elders still speak.

The well-known family of Pico was founded in 1782, by Don José Maria, the father of the governor. The northern branch of this family sprang from Don José Dolores, who arrived in 1790. The first of the Sotos was Don Ignacio, a pioneer of 1776; and the Moraga family date from the same year, their founder being Comandante José Joaquin, of San Francisco Presidio and San José Pueblo. A large and prominent Los Angeles family, that of the Avilas, was founded by Cornelio Avila in 1783. Alcalde Avila was killed in the revolution of 1836. Several daughters married Americans. The Lugos are often spoken of in histories. They descend from a Mexican soldier, Francisco Lugo, who arrived in 1769, the date which ranks among Spanish Californians as 1849 does among American pioneers. His four daughters married into the four prominent families of Ruiz, Cota, Vallejo, and Carrillo. The town of Martinez, near Monte Diablo, takes its name from the Martinez family, whose founder was an early alcalde of San Francisco, and three of whose daughters married Americans. A far later arrival was the Jimeno family, one of whom was Governor

Alvarado's Secretary of State, whose widow became the wife of Dr. Ord, and whose two sons were taken to the Atlantic States by Lieutenant Sherman in 1850 to be educated. An intimate friend of this famous secretary was Don José M. Romero, the most widely known teacher and author of the province, who wrote and printed the "Catecismo de Ortologia" at Monterey in 1836, and established an advanced school, the best in California until the days of Enrique Cambuston and José Maria Campina, whom Governor Alvarado brought from Mexico.

The Bandinis descended from an Andalusian family of high rank, and were in California by 1771. Old Captain José Bandini was the first to raise the Mexican flag, which he did on the ship *Reina*, at San Blas, in 1821. His son Juan married Dolores Estudillo, and, after her death, Refugio Arguello, and was very prominent in the province from 1825 to 1845. The extensive Carrillo family and also the great Ortega family date their Californian record from 1769. The Ortegas founded Santa Barbara. The Carrillos in the second generation married into the Vallejos, Castros, Pachecos, and many other proud families. At the time of the conquest they had connections in every part of the province. The late Judge Covarrubias, of Santa Barbara, one of the most prominent jurists of Southern California, was connected by marriage with the Carrillos. Captain Noriega, of Santa Barbara, also married a Carrillo, and when he died, in 1858, he left more than a hundred descendants. There were large families in those days of simple,

GENERAL ANDRES PICO.
(FROM A PHOTOGRAPH IN POSSESSION OF PIO PICO.)

healthy outdoor life; one often reads in the old documents of from twelve to twenty sons and daughters of the same parents. Don Cristobal Dominguez, who owned the Las Virgenes ranch, left fourteen living children, and one hundred and ten living descendants.

The founders of the early families came from

thing which "astonished all his friends," for it was not seemly; no other Californian did so. The officer who founded Branciforte, Colonel Pedro Albertia, was a Catalan. The first of the Alvisos, the Valencias, and the Peraltas were from Sonora. José Mariano Bonilla, from the city of Mexico, was one of the first lawyers in

the province. The Vacas, descendants of the famous *conquistadore* Captain Vaca, who was under Cortez, came from New Mexico. Don Manuel Requena of Los Angeles came to California from Yucatan. The Suñols, who owned one of the most beautiful of valleys, were from Spain, and the sons were sent to Paris to be educated. Lieutenant Valdez, who was in the Malaspina expedition of 1791, returned to Europe and was killed at Trafalgar. This noted expedition, under Alejandro Malaspina, consisted of two royal corvettes of Spain, which left Cadiz in 1789, reached California in 1791, and went around the world. In ways like these, and from a thousand channels of commerce and adventure, every province of Spain and Mexico became represented among the pioneer families of California.

MARIA DE JESUS VALLEJO (SISTER MARIA TERESA).

all parts of the Spanish dominions. The Castros were from Sinaloa, and so were the Lugos. Old Don Aguirre, a wealthy ship-owner and merchant, who first came in his vessel the *Guipuscuana*, was a Basque, and his family is still represented in San Diego and Santa Barbara. Another Basque pioneer was Don José Amesti, a rough, honest fellow, alcalde of Monterey, and afterwards the governor's secretary, who married Prudencia Vallejo. General Castro once told me that Don José "would even say 'carajo' before his children," a

royal commissioner Bobadilla to America with orders to carry Columbus a prisoner to Spain. Another famous Vallejo was a captain under Cortez, followed that illustrious cutthroat to the complete conquest of Mexico, and became governor of the province of Panuco, lord of great silver mines, and master of peons innumerable.

Bilbao, the ancient capital of Burgos, Spain, was the place from which the branch of the Vallejos that is known in California started for the New World. Of this branch came Don

THE MOTHER OF GENERAL VALLEJO, BORN
MARIA ANTONIA LUGO.

Ignacio Vicente Vallejo, born in 1748, in the city of Guadalaxara, Mexico, and designed, as were many of the family before him, for holy orders and the service of the Church. The young man rebelled, volunteered under Captain Rivera y Moncada in Padre Junipero Serra's famous expedition, landing at San Diego in 1769, and thus became a pioneer among the Spanish pioneers themselves. He soon became prominent in the colony, and was not only made military commander of various towns, but was long the only civil engineer in the province, laying out most of the greater irri-

gation works of the Missions and pueblos, and becoming the owner of extensive and valuable estates.

Don Ignacio's engagement and marriage are noted in most of the chronicles of the period. The great Missions were being founded, and, outside of priests and Indians, few people were in the country; California, as late as in the "golden prime of '49," was a masculine community, and women of the better sort were hard to find. When, therefore, the young soldier of fortune saw, at San Luis Obispo, in 1776, on the day of her birth, an infant daughter of the Lugo family, then as now prominent among the Spanish families of Southern California, he did not delay his wooing. Using all the dignity and formality that the aristocratic *gentils de raison* of the period considered essential in such matters, he obtained an interview with the parents, and negotiated a solemn contract of engagement with the day-old Señorita Maria Antonia Lugo, subject to the girl's future consent. She grew up to be an exceedingly attractive and intelligent young woman, and in due season they were married. It proved an extremely happy and fortunate union, and the success of the founder of the Vallejo family in California in speaking for an infant in arms became almost a family proverb from San Diego to Sonoma. Don Ignacio's home was notable, even in that pioneer age, for its patriarchal simplicity, and he maintained to the day of his death, in 1831, a noble and dignified leadership of the family. Señora Vallejo survived her husband until 1851, and a painting made a short time before her death shows the almost puritanical severity and strength of character of this old Spanish lady of the Arcadian period of California.

None of the Spanish pioneer families have more carefully preserved the traditions and

DE LA GUERRA MANSION.

relics of the past than have the Vallejos. With them, as with others, the time of greatest prosperity was between 1820 and 1846. Among the great families with which they were closely connected by marriage or friendship were the De la Guerras, whose founder, Don José de la Guerra y Noriega, was born in Santander, Spain, of a family which dates back to the Moorish wars. Early in the century the family owned no fewer than eight large ranches, and as late as 1850 Don José sold nearly \$100,000 worth of cattle annually, and was one of the great men of the pastoral period, with hundreds of herdsmen scattered over leagues of territory. His wife, Maria Antonia Carrillo, the daughter of Don Raymundo, one of the first commanders at San Diego and Santa

of every visitor. The freedom from care, the outdoor life and constant exercise, and the perfect climate of California had re-created the Andalusian type of loveliness. In the Ortega family, for instance, the women, who all had brown hair and eyes and were of pure Castilian stock, were so renowned for their beauty that their fame extended to the city of Mexico, and General Ramirez came from there with letters of introduction to win a daughter of the Ortegas. Another of the famous beauties of her day was the Señora Maria Isabel Cota de Pico, who was born in 1783 and died in 1869, leaving over three hundred living descendants. Señorita Guadalupe Ortega married young Joseph Chapman, a New Englander who landed on the coast in 1818 from

ADOBE HOUSE, SONOMA, ERECTED BY GENERAL VALLEJO, 1834.

Barbara, was called in common speech "that most benevolent lady." The seventh of their eleven children was several times mayor of Santa Barbara. The eldest daughter married W. P. Hartnell, of London. The youngest daughter, Antonia, afterwards Mrs. Oreña, was called in her day the greatest beauty on the Pacific coast.

It is remarkable how many of the daughters of the best families of the old Californian towns married Americans and Englishmen of standing. In the Carrillo family four daughters married foreigners; the Ortegas, Noriegas, and many others showed a similar record. The grace, beauty, and modesty of the women of the time were the admiration

the Buenos Ayrean privateer which Bouchard commanded, and who was captured by Corporal Lugo, whose sister married Don Ignacio Vallejo. With true Spanish hospitality Lugo made him a guest of the family, and in a year or two secured his social recognition among the leading families. Chapman became prominent at the Mission San Gabriel, and at Los Angeles and Santa Barbara, where he died in 1849.

A multitude of stories of the social life of the Spanish period might be told here, but it is sufficient to give the outline as told by the descendants of those old families. Each town on the coast was the center of the hide and tallow trade for a hundred miles or more. The

low adobe stores there held piles of costly and beautiful goods in the days of which Farnham and Dana wrote—the days when the great cattle princes came from their ranches to hold festival. The young cavaliers rode in on fiery but well-trained and gaily caparisoned horses, and all the wonderful feats of horsemanship of as fine a race of riders as the world has ever seen were performed daily on mesa and sea-beach and plaza. But the home life of these great families was simplicity itself. In many a Spanish house there was no fireplace, window, or chimney. The fire for cooking was built on a clay floor, partly roofed, outside of the main building. The household utensils were few—a copper or iron kettle, a slab of rock on which to pound corn or wheat, a soapstone griddle for the tortillas. Dishes, tableware, and furniture came slowly, and were of the most simple description. For years a raw hide stretched on the floor with a blanket spread over it formed the usual bed in early California. Everything was kept exquisitely clean, and though the Spanish families learned to spend more on their houses and belongings, they seemed to look upon such things as only affording opportunities for a more generous hospitality.

In the old days there was not a hotel in California, and it was considered a grievous offense even for a stranger, much more for a friend, to pass by a ranch without stopping. Fresh horses were always furnished, and in many cases on record when strangers appeared to need financial help a pile of uncounted silver was left in the sleeping apartment, and they were given to understand that they were to take all they needed. This money was covered with a cloth, and it was a point of honor not to count it beforehand nor afterwards. It was "guest silver," and the custom continued until its abuse by travelers compelled the native Californians to abandon it. Among themselves no one was ever allowed to suffer or struggle for lack of help. The late Dr. Nicholas Den, of Santa Barbara, who married into the Ortega family, once needed money

DOÑA VALLEJO, WIDOW OF GENERAL VALLEJO,
BORN FRANCISCA BENICIA CARRILLO.

to carry through a speculation, and thought of going to Los Angeles to borrow it. Old Father Narciso, hearing of the matter, sent his Indian boy to him with a "cora," or four-gallon tule basket, full of gold, and the message that he ought to come to his priest whenever he needed help.

The collections of "Documents relating to the History of California" made by General Vallejo and his brother Don J. J. Vallejo, and now in the Bancroft library, and the very graphic and careful series of manuscript notes and memoranda by General Vallejo, entitled "Historia de California," all cast light upon the social and economic conditions in these Arcadian days. A very large number of the old families, such as the Castros, Picos, Arces, and Peraltas, and many of the Americans who had married native Californians, furnished manuscripts, letters, and various documents of permanent value. In fact it may be doubted if

the pioneer period of any other American State has had a more complete mass of original authoritative data made ready for the historian's use. Much still remains to be collected from first hands, and many minor historical questions will probably be solved by documents still held by the native Californian families, who treasure every scrap of written paper.

The link between the old and the new, between the quiet and happy pastoral age of the beginning of the century and the age of American growth and change that followed fast on

the capital of the province, and died January 18, 1890, in Sonoma, once the northern fortress of the province and guarded by the young general's soldiers. At the age of sixteen he was an officer in the army and the private secretary of the governor of California. In 1829, when only twenty-one, he became lieutenant-commander of the northern department, which included all the country north of Santa Cruz, and made his headquarters at the presidio. Here he organized the first town government of Yerba

WASHING-DAY ON A RANCH.

the conquest, was that remarkable man, General Mariano Guadalupe Vallejo,¹ whose children, as he once told me, "were born under three administrations—Spanish, Mexican, and American." One of his daughters said, "Two of us, when we were small, were called by our brothers and sisters 'the little Yankees.'" General Vallejo, the eighth of the thirteen children of Don Ignacio, was born in 1808, in the old seaport town of Monterey, long

Buena, and for five years exercised both civil and military functions there. The Solis rebellion against Governor Echeandia, who had removed the seat of government from Monterey to San Diego, began in the fall of 1829, and Vallejo aided in the defeat of the insurgents at

Santa Barbara. He was a member of the territorial deputation in 1831, and brought articles of impeachment against Governor Victoria, who was defeated and driven from California in the revolution which followed. The next year General Vallejo married Señorita Francisca Benicia Carrillo, by whom he had seventeen children, nine of whom are now living.²

¹ See portrait in *THE CENTURY* for December, 1890.

² The eldest became the wife of General John B. Frisbie; the others are the wife of Dr. Frisbie, Mrs.

By 1840 the young lieutenant had reached Attila Haraszthy, Mrs. E. Emperan, Mrs. J. Henry Cutter, Dr. Platon Vallejo, Andronica Vallejo, Ulla Vallejo, and Napoleon Vallejo.

THE FANDANGO.

the rank of lieutenant-general, and was the one man in California to whom the entire province turned with perfect confidence in every emergency. When Gutierrez was deposed Vallejo took control of affairs, and he made his nephew Alvarado civil governor, retaining military control himself. Micheltorena, who succeeded him as governor, confirmed all his acts, and appointed him military commander of the whole territory north of Monterey. Vallejo then founded the town of Sonoma, making it his military headquarters, and spent more than a quarter of a million dollars there. He sent to Mexico for a printing press and type, set up with his own hands his orders and proclamations, and printed and bound several pamphlets. This was in 1839. The famous Zamorano press of Monterey, which began work in November, 1834, with carnival ball invitations, had printed the "Catecismo" and many public documents, which are much prized by collectors. Paper was so scarce that the proof-sheets and defective prints were saved and used for fly-leaves of the curious little *arisméticas* and other text-books that were issued a few years later for the schools of the province.

One has to go back to the days of the famous Spanish "marches," or frontier towns built and defended in Spain's heroic age by her proudest knights, to find a fit parallel in history to the position held by General Vallejo during the closing years of the Mexican rule in California. He had absolute sway for a hundred miles or more, and he "kept the

border." His men rode on horseback to Monterey and to Captain Sutter's fort on the Sacramento, bringing him news and carrying his letters. Spanish families colonized the fertile valleys under his protection, and Indians came and built in the shadows of the Sonoma Mission. He owned, as he believed by unassailable title, the largest and finest ranch in the province, and he dispensed a hospitality so generous and universal that it was admired and extolled even among the old Spanish families. J. Quinn Thornton, who visited the coast in 1848 and published his experiences, says: "Governor-General Vallejo owns 1000 horses that are broken to the saddle and bridle, and 9000 that are not broken. Broken horses readily bring one hundred dollars apiece, but the unbroken ones can be purchased for a trivial sum." More and more in the closing years of the epoch and the days of the conquest General Vallejo became the representative man of his people, and so he has received, among many of the old families, the reproachful name of a traitor to California and to his nation. The quiet intensity of this bitterness, even to-day, is a startling thing. I have seen men of pure blood, famous in provincial history, leave the room at the name of Vallejo.

In 1844-45 the native Californians drove out Governor Micheltorena, and began to discuss the feasibility of establishing a separate government. In 1846 the famous Santa Barbara convention of leading ranchers occurred, and, according to General Vallejo's memo-

OLD SWISS HOUSE OF GENERAL VALLEJO AT SONOMA, IMPORTED IN PARTS FROM SWITZERLAND.

randa, English influences were very strong. He exerted all his personal influence, and secured an adjournment of the convention to Monterey, where that fine old American, Consul Thomas O. Larkin, helped him in his struggle. Here Vallejo made a bold speech against an English protectorate, against a separate republic, and in favor of annexation to the United States and ultimate statehood. He was thoroughly equipped for the task, the best educated man among the native Californians, and inspired by the American ideal. The convention closed with its leaders, such as his nephews Castro and Alvarado, ready to adopt the views of Vallejo, and the way seemed prepared for a hearty welcome to the Americans. But the Bear Flag episode followed, Vallejo was carried a prisoner to Sutter's Fort, and the opportunity of peaceful conquest was lost. Nevertheless, as soon as he was released he threw himself heart and soul into the work of organizing a government. He aided in framing a temporary code of laws, and in securing its support by the Spanish population. He laid out the town sites of Benicia and Vallejo on the strait of Carquinez, and he was a leading member of the constitutional convention. General Vallejo's whole career showed that he was actuated by a large and noble ambition to be recognized as the foremost citizen of the State. Nothing marked this element in his nature more clearly than the magnificent plans for his proposed capital

at Vallejo. He offered to construct public buildings and give large areas of land. The long-forgotten scheme, which was laid before the legislature of 1850, who accepted, and was ratified by the people, was in every respect worthy of his magnificent liberality. He began to build his new city, but, contrary to the pledges of the State, the capital was removed to Sacramento at the next session of the legislature. Squatters began to settle upon his great Suscol and Petaluma ranches, and ultimately the Supreme Court of the United States rejected the title to the larger part of his estates. He spent the rest of his life on a comparatively small homestead, "*Lachryma Montis*," near the old town of Sonoma.

Lachryma Montis is one of the few historical mansions of the Pacific coast. The dwelling house, built in 1850-51, cost nearly \$60,000 and came from all parts of the world—the mantelpieces from Honolulu, the iron from China, the bricks from South America. Carpenters' wages were then seventeen dollars a day, and the great redwoods that were hewn in the Sonoma forests were "whip-sawed" by hand for the plank required. The spring on the mountain side that gave the mansion its name was walled in, and a lake which supplied the town with water and fed fountains in the orange, lemon, and olive groves was thus formed. More nopal hedges were planted, and the old ones extended. A chalet imported in parts from Switzerland was erected near the man-

sion. Farther away were the old adobes. A pavilion of iron, glass, and bamboo, imported from China, cost, as members of the family tell me, more than a hundred thousand dollars. When the estates were lost the beautiful grounds began to fall into ruins, through lack of means to keep them up, and in 1890 General Vallejo died a comparatively poor man.

Sonoma Valley is full of stories of his generosity. Father Lorenzo Waugh, an early Methodist circuit-rider of the region, saw the squatters taking up land in the valley while waiting for a decision respecting Vallejo's title. He went to the general, and was told to go ahead and settle on a quarter-section, and he would do all in his power to secure him a title. Father Waugh did so, and nine years later, while Vallejo was away, the lines of this particular district were settled, and his lawyer, against orders, sold the tract on which Waugh lived. As soon as Vallejo learned this he gave him a title to three hundred acres of better land, a part of the home estate. No one will ever know how many hundreds of American pioneers owed their start in the world to General Vallejo, even while he was struggling against immense financial difficulties and losing his lands, not by acres, but by square leagues.

in 1849, in Alameda County. "You can keep it; I cannot."

After General Vallejo found his estate slipping away he devoted himself more and more to horticulture and to the education of his children. He occasionally appeared in public, and the greatness of his services to the commonwealth was recognized by every thoughtful citizen. The general's name is mentioned in nearly every book of travels or magazine article relating to early California. In his later years he gathered up and put on record a surprising wealth of material relating to the old Spanish days of California. From him the historians have drawn most of their important details. His manuscript, now in the Bancroft collection, is written with such exquisite care and fidelity to truth that, like General Bidwell's recollections of early days in the Sacramento Valley, it has become the primary authority upon all within its range.

General Vallejo's readiness of apt anecdote was always remarkable. Patti once dined with him, and asked the old soldier if he enjoyed the first opera he ever heard.

"Why, no," said Vallejo; "and yet I confess I shall never forget it."

This reply aroused Patti's curiosity, and she

AN ADOBE IN SONOMA.

Many others of the old Californians made a distinction between the "Gingo thieves" and the pleasant, manly pioneers who were good neighbors. A volume could be written about the unsolicited gifts of land—fifty acres here, a hundred there—made to young Americans to whom the great rancheros had taken a fancy, or who had rendered them a service. "Take the land," said Don Alviso to a Connecticut man

demanding when and where the event took place.

"In 1828, on the site of the Palace Hotel, San Francisco."

"Indeed! And who was the prima donna so long ago as that?"

"Well, I can't say," was the smiling answer; "but there were at least five hundred coyotes in the chorus."

THE VALLEJO CHARIOT FOR POSTILION AND FOOTMAN, BROUGHT FROM MEXICO EARLY IN THIS CENTURY.

A volume of description could not give a more complete picture of the loneliness of the peninsula at that time.

In his younger days General Vallejo not only knew almost every one of the five thousand Spanish Californians in the province, the greater part of the Mission Indians, and the chiefs of the wild tribes, but he gathered up, even in his youth, the traditions of the pioneers, and tested their accuracy by every possible documentary and other evidence. His journals are full of variety, and form a complete picture of the entire Spanish period. One of his memoranda speaks of the galleon *San Augustin*, which was wrecked in Tomales Bay in 1595, and of which portions drifted into the Golden Gate in 1830, where they were found by Don José Antonio Sanches and identified by General Vallejo! He has traced the track of every exploring expedition from the earliest settlement, and determined most of their camps. His story of the discovery of San Francisco Bay illustrates the slowness of the progress of settlement. It was late in 1769 that the Portala party and Captain Rivera, with whom was Don Ignacio Vallejo, worked northward from San Diego, past Monterey, and down the San Mateo peninsula, till, on November 2, two hunters of the expedition first looked upon the bay of San Francisco, and November 4 the whole party saw the great bay. In March, 1772, Captain Fages and Father Crespi made that notable exploration which extended from Monterey across the Salinas Valley, through the hills to the Santa Clara Valley, up the east side of the bay past San José and Oakland, and along the shores of San Pablo and Suisun to where Antioch now stands. The San Joaquin River was crossed at this point, and recrossed by the expedition, which returned to Monterey through the Monte Diablo

foothills. November 23, 1774, Captain Rivera, with sixteen soldiers and Father Palou, made another expedition to the bay. They entered the Santa Clara Valley and skirted the western shore of the bay of San Francisco, following the level plains past the sites of Palo Alto, Belmont, and many other towns of to-day, and crossing to the ocean beach at Laguna de la Merced, they reached Point Lobos, and climbed the cliff to look down on the Golden Gate.

December 4 they planted the cross. The general says in his commemoration address, "That cross I saw myself in the year 1829." The expedition returned to Monterey "by way of San Pedro, Spanish-town, Half Moon Bay, Point New Year, Santa Cruz, Watsonville, Castroville, and Salinas." In 1775 Captain Ayala sailed the *San Carlos* into the bay of San Francisco, and "remained forty days, exploring it in all directions." In the spring of 1776 Colonel Anza and Lieutenant Moraga led another land expedition to the region and returned to Monterey.

Then came the foundation of the Mission and the Presidio. The military force, under Lieutenant Moraga, consisted, says General Vallejo, of one sergeant, two corporals, and ten soldiers, with their wives and children. These conveyed Fathers Palou and Cambon, with two Indian servants and three neophyte Indians, who cared for eighty-six head of Mission cattle, partly their own, partly belonging to the king. June 27, 1776, they camped at the lagoon or lake of Dolores, near where the Mission was soon afterwards built. The soldiers erected barracks of tule, soon replaced by wood. The day of the foundation of the Mission was fixed at October 4, the day of St. Francis, and October 8 the actual building was begun. Among those present were Don Ignacio Vallejo, Lieutenant Moraga, and members of the families of Briones, Galindo, Castro, Pacheco, Bojorques, Bernal, Peralta, Higuera, and others of prominence in Spanish California.

The historians of Spanish Californian days must draw on such traditions as these, obtained from General Vallejo's conversations, or written in his memoranda. A single magazine article can contain only a small part of the wealth of tradition that has gathered about the old Sonoma homestead of the Vallejos—that homestead which is in the highest degree typical of all Spanish homesteads of the first rank on the Pacific coast. Everywhere, in the most picturesque portions of California, are the old adobes that once were social centers of the stately life of nearly a century ago. Most of them are merely ruins, but many are still the homes of the descendants of the first fami-

lies of the province. The years that brought such change and wreck to the old days have now carried them so far back into the mists of tradition that they seem centuries away. Vallejo's fortress on the frontier is now a town, as dull and unromantic as Yonkers. About the ancient pueblo of Los Angeles has sprung up an intensely modern city. A railroad extends through the very graveyard of San Miguel Mission. Much needs to be done by Cali-

fornians to preserve the memorials of the past that was so fair and so fruitful a beginning of the story of the commonwealth. The agency through which this is to be accomplished is likely to be the association known as the Native Sons of the Golden West, under whose public-spirited direction was conducted the recent successful celebration of the admission of California.

FROM AN OLD DOCUMENT.

THE MISSIONS OF ALTA CALIFORNIA.¹

CROSS AT MONTEREY MARKING THE LANDING PLACE OF JUNIPERO SERRA.

ALTHOUGH the peninsula of Lower California was discovered as early as 1534, and many attempts were made to colonize it, it remained wholly unoccupied by Spain down

to 1697. In February of that year two Jesuit fathers, Juan Maria Salvatierra and Francisco Eusebio Kino, asked permission to attempt the spiritual conquest of the country, which was granted on condition that the king should not be called on for any part of the expense involved, and that possession should be taken distinctly in the name of the Spanish crown. Armed with this authority and the sanction of their superiors in the order, the two missionaries set about collecting funds for their undertaking, and in a short time succeeded in obtaining sufficient means to commence it. These funds, subscribed by charitable individuals, whose names and contributions the gratitude of the fathers has preserved for us to this day, increased, in progress of time, to an aggregate of sufficient importance to find frequent mention in Mexican legislation and history, under the name of the "Pious Fund of the Californias." It constituted afterwards the endowment and support of the Missions on all the west coast of the continent as far north as claimed by Spain, the whole of which was called by the general name of the Californias. The thirteen Missions founded by the Jesuits

¹ See also "Father Junipero and his Work: A Sketch of the Foundation, Prosperity, and Ruin of the Franciscan Missions in California," by "H. H.," in this magazine for May and June, 1883.—EDITOR.

in Lower California extended from Cape San Lucas, at the extremity of the peninsula, northwards. Details regarding them are deemed out of place here: they were in a flourishing condition at the time of the expulsion of the order in 1768, and the establishments remain to the present day; ruined indeed and deserted by the population that once clustered round them, but attesting still the pious zeal of their founders.

In 1767 the Spanish monarch, by a "pragmatic sanction," directed that the Society of

abroad. A few moments only were allowed to them to snatch their breviaries, beads, prayer-books, and necessary clothing, and within an hour after the first knock at the door of the establishment the whole body of inmates was in motion towards the coast, where they were with equal suddenness and despatch shipped off to Rome. During their journey to the point of embarkation no intercourse was allowed either with friends or with persons casually met on the road. They vanished

THE FIRST MISSION IN CALIFORNIA (SAN DIEGO).

Jesus should be expelled from his dominions. With a refinement of cruelty this decree was directed to be put into force in every part of the kingdom at the same instant. At a given hour of the night, long after the inmates were in profound sleep, a train of vehicles was drawn up at the door of every Jesuit college, novitiate, or other establishment of any kind, and the porter was roused from sleep and directed, in the name of the king, to summon all the members of the community to instant assembly in the chapel or refectory. Hastily putting on their garments, the members obeyed the summons, bewildered to conjecture its cause. The roll was called, the laggards, if there were any, were brought in, and the assembled members were then informed that his Majesty had been pleased to banish them forever from his dominions. Carriages were awaiting them below, and relays of animals were provided for their transportation to the nearest seaport, where vessels were prepared to convey them

from Spain, and from all the European possessions of Spain, as silently and as rapidly as a morning mist.

It was not possible to enforce this barbarous decree with the same cruel precision in California. The place was too remote, and its resources inadequate. It was necessary to supply the Missions with other missionaries, else the Indians, who had been with so much trouble and effort reduced to habits of civilization, would infallibly have relapsed again into savagery and paganism, and the whole work of conquest would have to be recommenced. Thus the necessities of the situation somewhat modified the cruelty of the proceedings in California. The missionaries were assembled in La Paz in February, 1768, and amid the tears and lamentations of their Indian flocks, who, from every Mission in the peninsula, sent delegations to accompany their spiritual fathers, they finally embarked, and, after a toilsome pilgrimage across Mexico, finally took ship at Vera

MISSION OF SAN JOSÉ. (DRAWN AFTER A DAGUERRETYPE TAKEN IN 1853, NOW OWNED BY J. L. BEARD.)

Cruz on the 13th of April. From the magnitude of the Pious Fund the hungry politicians, who hoped to profit by their expulsion, looked for large amounts of money from the plunder of the California Missions. The total of all sums found at them proved less than a hundred dollars.

Arrangements had been made by the viceroy by which Franciscan friars, drawn from the convent of San Fernando de Zacatecas, took the place of the expelled Jesuits in the several Missions; and adopting the rules and practices of their predecessors they gradually slid into the confidence of the simple-hearted natives, and carried on the work as it had been commenced.

At this time the Marquis de Croix was Viceroy of New Spain, and José de Galvez was sent over from the mother country as Visitador General, armed with extraordinary powers. Apprehensions of an attempt by the English to enlarge their possessions in America and to obtain a foothold on the Pacific made it appear unsafe to permit the northwest coast to remain longer unoccupied, and Galvez determined to colonize it on a large scale. He was a man of immense zeal and untiring industry, well chosen for an occasion requiring energetic action. Fortunately he met with an ecclesiastic to second his movements who possessed the same qualities in as high a degree, perhaps in a higher, and who joined to them a humble piety, a zealous devotion to duty, and a self-abnegation even more remarkable. This was Father Junipero Serra, president of the Missions.

Father Michael Joseph Serra was born in the island of Majorca, in the year 1713. After pursuing his studies in the Lullian University there he evinced a preference for a religious life, and

BELLS AND FONT AT SAN JOSÉ.

was admitted to the order of St. Francis, taking instead of his baptismal names that of Junipero, by which only he is known in history. The Franciscans and Dominicans were, about that period, extending their Missions among the Indians of America in rivalry with the Jesuits, and Father Serra with three of his fellow-mem-

bers became inflamed with the desire to take part in these pious enterprises. The other associates were Fathers Rafael Verger, Francisco Palou, and Juan Crespi. They obtained permission to join a body of missionaries which in 1749 was assembled at Cadiz to embark for the New World, and after a ninety-nine days' voyage they landed in Vera Cruz. Palou has left us a quaint history of their journey, which in these days of rapid transit is rather amusing. The voyage from Majorca to Malaga was made in a small English coaster,

the captain of which [says he] was a stubborn, cross-grained heretic, of a disposition so aggravating that, during the fifteen days our passage to Malaga lasted, he gave us not a minute's peace. We scarce had time to read our office, from his everlasting and

missionaries overboard, and on one occasion clapped a dagger at Father Serra's throat, threatening his life. It is not surprising that the missionaries rejoiced at again reaching *terra firma* after fifteen days of tossing in a Mediterranean vessel and enjoying from the officers these social amenities.

After many years' successful missionary efforts in the Sierra Gorda, Father Serra was selected to take principal charge of the Missions of California, now confided to the Franciscans, and he arrived at the port of Loreto with fifteen associates on the 2d of April, 1768. After having made the necessary dispositions for occupying the various establishments of the peninsula—a task which occupied many months, as they extended over a territory seven hundred

MISSION OF SAN ANTONIO OF PADUA, ABOUT TWENTY MILES FROM MONTEREY.

persistent craving to dispute about religion and wrangle over doctrinal points. He understood no language save English and a mere smattering of Portuguese, and in the latter he conducted his disputations. With the English version of the Bible in his hand he would read a text of the Holy Scripture and proceed to interpret it according to his own ideas. But our Father Junipero was so well versed in dogmatic theology and so familiar with the Holy Scriptures that he would at once point out the error and misinterpretation, and frequently refer to another text in confirmation. The captain would thereupon rummage his greasy old Bible, and when he could find no other escape would declare that the leaf was torn and he could n't find the verse he wanted.

The captain, as Father Palou states, remained "doggedly perverse" till the last, and in fact the disputes waxed so hot at times that he more than once threatened to throw the

mile. in length—he was ready to coöperate with Galvez in the subjection of Upper California to the practical dominion of the crown of Spain and the Christian religion. Two expeditions were organized for the purpose, one by sea and the other by land. The latter was formed into two detachments, which, after a toilsome march from San Fernando de Vellicata, on the Indian frontier of Lower California, were, on the 1st of July, 1769, reunited at the bay of San Diego, where the schooners *San Carlos* and *San Antonio*, which had come up the coast to meet them, were also safely anchored. San Diego was a place of which at that time nothing more was known than that there was an excellent harbor, which had been visited by Sebastian Vizcayno in his voyage of 1601-2. This journey to San Diego occupied ninety-three days, during which Father Serra suffered

MISSION OF SAN BUENAVENTURA.

excruciatingly from an injury to one of his legs, so that at times he could neither walk nor ride.

The first Mission of Upper California was founded at San Diego, and before the lapse of a fortnight a second expedition was organized, under Don Gaspar de Portola, which was directed to proceed up the coast as far as Monterey and to found a Mission there. Monterey was also a place made known to Spanish geographers by Vizcaino's voyage of 1602, in his report of which he had described it in glowing terms as a magnificent harbor, fit to shelter the navies of the world. Fathers Juan Crespi and Francisco Gomez were the chaplains of this expedition, which was also to have the coöperation of the two schooners, which were directed to the same destination.

How this land expedition toiled up the coast from San Diego, of its "moving accidents by flood and field, of hairbreadth 'scapes, . . . of antres vast and deserts idle, rough quarries, rocks and hills," of how in its search for Monterey it stumbled on the bay of San Francisco and first made known to civilized man the garden of the present State of California, I have related elsewhere and will not here repeat. Suffice it to say, that having penetrated as far up the coast and over the Coast Range as to look down from the crest over what is now Searsville on the broad expanse of the Santa Clara Valley, and on the great estuary which its historian described as a "Mediterranean sea," the expedition, compelled by the approach of winter, the scarcity of food, and the increasing hostility of the aborigines, turned on the 11th of November to retrace its steps to San Diego.

On again reaching Point Pinos and the supposed place of the bay of Monterey, nearly a

PULPIT AND CONFESSIONAL OF SAN BUENAVENTURA.

fortnight was devoted to a vigorous exploration of the rugged coast in search of the magnificent port described by Vizcayno, but in vain. The locality did not correspond in any degree to the traveler's glowing description of it. Failing to discover the harbor they were looking for, the leaders concluded it had been either destroyed by some convulsion of nature, or filled with silt, and so obliterated. They erected a large wooden cross at the north and another at the south side of Point Pinos as a memorial of their visit, and for the purpose of attracting the attention of the expedition by sea, which had been despatched to coöperate with them. On the cross erected at the south side was cut the legend: "Dig at the foot of this and you will find a writing"; and at its foot accordingly

cisco on the 11th of November, passed Point Año Nuevo on the 19th, and reached this point and harbor of Pinos on the 27th of the same month. From that date until the present, 9th of December, we have used every effort to find the bay of Monterey, searching the coast thoroughly notwithstanding its ruggedness, but in vain. At last undeceived, and despairing of finding it after so many efforts, sufferings, and labors, and having left of all our provisions but fourteen small sacks of flour, we leave this place to-day for San Diego. I beg of Almighty God to guide it, and for you, traveler, who may read this, that he may guide you to the harbor of eternal salvation.

Done in this harbor of Pinos, the 9th of December, 1769.

NOTE.—That Don Michael Constanzo, the engineer, observed the latitude of various places on the coast, and the same are as follows.

MISSION OF SAN MIGUEL, SAN LUIS OBISPO COUNTY.

they buried a brief account of their journey. Its text is set forth in the diary of Father Crespi as follows:

The overland expedition which left San Diego on the 14th of July, 1769, under the command of Don Gaspar de Portola, Governor of California, reached the channel of Santa Barbara on the 9th of August and passed Point Concepcion on the 27th of the same month. It arrived at the Sierra de Santa Lucia on the 13th of September, entered that range of mountains on the 17th of the same month, and emerged from it on the 1st of October. On the same day caught sight of Point Pinos and the harbors on its north and south sides without discovering any indications or landmarks of the bay of Monterey. Determined to push on farther in search of it, and on the 30th of October got sight of Point Reyes and the Farallones at the bay of San Francisco,¹ which are seven in number. The expedition strove to reach Point Reyes, but was hindered by an immense arm of the sea, which, extending to a great distance inland, compelled it to make an enormous circuit for that purpose. In consequence of this and other difficulties, the greatest of all being the absolute want of food, the expedition was compelled to turn back, believing that it must have passed the harbor of Monterey without discovering it.

Started on return from the estuary of San Fran-

Here follow the latitudes of various points, after which the letter continues:

If the commanders of the schooners, either the *San José* or the *Principe*, should reach this place within a few days after this date, on learning the contents of this writing, and the distressed condition of this expedition, we beseech them to follow the coast closely towards San Diego, so that, if we should be happy enough to catch sight of them, we may be able by signals of flags or firearms to apprise them where succor and provisions may reach us.

"Glory be to God," says the pious chronicler, "the cross was erected on a little hillock, close to the beach of the small harbor on the south side of Point Pinos, and at its foot we buried the letter."

The cross erected at the north side of the Point bore the simple inscription, cut on its transverse arm with a razor: "The overland expedition from San Diego returned from this place on the 9th of December, 1769, starving."

Their prayer for succor was in vain; it never reached those to whom it was addressed. The schooners, after beating up the coast as far as the latitude of Monterey, were driven back by adverse winds, and, after months of fruitless effort to make port there, returned to San Diego, arriving just in time

¹ The bay of San Francisco of the old Spanish geographers and navigators was what we now call "Sir Francis Drake's Bay."

to relieve the infant colony from starvation. The land party plodded its weary way down the coast, encountering sickness, suffering, privation, and occasionally death, until on the 21st of January, 1770, its surviving members reached

San Diego, whence it had set out six months and twelve days before. There were interred the remains of Fathers Junipero Serra, Juan Crespi, and Rafael Verger.

San Diego and Monterey served to mark the extremes of the first Spanish occupancy ;

San Diego, whence it had set out six months and twelve days before.

The effort at missionary colonization was not, however, abandoned. In 1770 another expedition moved up the coast, following the track of the first explorers, whose diary was their guide, and founded the Mission of San Carlos on the bay of Monterey, close to which was established the presidio of the same name. The place first selected proved unsuitable for the site of a Mission, and before the close of 1771 the establishment was removed a few miles to the southward and planted on the banks of the Carmel River, overlooking the charming little bay of the same name. This new foundation was called "El Carmelo." The presidio retained its site and subsequently became the capital city of the department.

Monterey has become in our day a famous watering-place frequented by visitors from the ends of the earth, and the ancient Mission, El Carmelo, now little better than a ruin, continues to attract the attention of travelers from its picturesque site and from the fact that it contains the remains of the venerable men whose pious efforts created the Missions and laid the foundations of civiliza-

MISSION OF SANTA BARBARA.

tion in California. The interval was filled up and the area of missionary conquest gradually extended by other similar establishments. The names of these institutions, founded in rapid succession, are as follows :

- 1771.—San Gabriel, San Fernando, San Antonio.
- 1772.—San Luis Obispo.
- 1776.—San Juan Capistrano, San Francisco de Assisi.
- 1777.—Santa Clara.
- 1782.—San Buenaventura.
- 1786.—Santa Barbara.
- 1787.—La Purissima.
- 1791.—La Soledad, and Santa Cruz.
- 1797.—San Juan Bautista, San José, San Miguel.
- 1798.—San Luis Rey.
- 1802.—Santa Ynez.

After this missionary efforts seem to have relaxed, but a revival at a later date led to the foundation of San Rafael in 1817, and

The Mission building is in the form of a hollow square of about one hundred and fifty yards front, along which a gallery extends. The church forms one of the wings. The edifice, a single story in height, is elevated a few feet above the ground. In the interior is a court adorned with a fountain and planted with trees, on the corridor extending around which open the apartments of the friars and the major-domo as well as those used for workshops, schoolrooms, and storehouses, and the chambers set apart for the accommodation of travelers and guests.

The male and female infirmaries, as well as the schoolrooms, are placed in the most quiet portions of the premises. The young Indian girls occupy a

San Francisco Solano in 1823. Sonoma, at which this last was located, was as far north as the missionaries penetrated.

These Missions were, of course, designed for the instruction of the rude aborigines in the truths of Christianity and in the arts of civilized life. The scheme of life and discipline was devised by the Jesuits, who in the sixteenth and seventeenth centuries organized and carried on the most extensive system of missions in every quarter of the heathen and pagan world. India, China, Japan, both coasts of Africa, a large part of Central Asia, and both North and South America were the scenes of their indefatigable labors.

The Franciscans, who succeeded the Jesuits in California, followed their system. In order to induce the Indians to abandon their nomadic tribal life, and to exchange their reliance for food on the fruits of the chase and the spontaneous products of the forest for the ways of civilized men, they were at first supplied by the missionaries with food and clothing and afterwards taught to cultivate the earth and support themselves. Timber was felled wherever accessible and transported to a suitable site, where, with unburned brick and tiles, the Mission church and buildings were erected. The following description of San Luis Rey, condensed from the account of an intelligent traveler who saw it in its palmy days, will convey a fair idea of the establishments of which it was a type.

MISSION AND BELLS OF SAN GABRIEL, NEAR LOS ANGELES.

set of apartments secluded from the rest and commonly called the "nunnery," and they themselves are familiarly styled the "nuns." They are thus entirely protected from intrusion, and, being placed under the guardianship of staid and trustworthy matrons of their own race, are taught to spin and weave wool, flax, and cotton, and do not leave the nunnery until marriageable.

The Indian children attend the same schools with those of the white colonists, and are educated with them. Those who exhibit the most talent are taught some music, as the plain chant of the church, as well as the violin, flute, horn, violoncello, and other instruments. Such as attain superior proficiency, either as carpenters, smiths, or even agricultural laborers, are made foremen, by the name of *alcaldes*, and placed in charge of the other workmen.

Two ecclesiastics are stationed at each Mission; the elder is charged with the internal administration and the duty of religious instruction, the

MISSION OF SAN FERNANDO, LOS ANGELES.

younger, with the direction of the agricultural and mechanical labor. The Franciscans assiduously cultivate the study of the Indian dialects, of which they have compiled dictionaries and grammars, some of which are still extant.

Industry is inculcated and encouraged by the constant example of the Fathers, who are always the first to put their hands to the work; and considering the meagerness of their resources, and the absence of European labor, the works they have executed with the aid of unskilled savages, of low intelligence, are marvels of architecture and mechanical skill. These comprise mills, machinery, bridges, roads, and canals for irrigation, besides extensive agricultural labors. For the erection of nearly all the Mission buildings large beams had to be transported from the mountains eight and ten leagues off, and the Indians taught to burn lime, cut stone, make bricks, tiles, etc.

Opposite the Mission building is usually a guard-house for lodging the escort of the priests, consisting of four cavalry soldiers, under command of a sergeant, who act as couriers, carrying correspondence and orders from one Mission to another, besides protecting the Mission from the incursions of hostile Indians.

The following is a summary of the ordinary day's work at a Mission. At sunrise the bell sounded for the Angelus and the Indians assembled in the chapel, where they attended morning prayers and mass and received a short religious instruction. Then came breakfast, after which, distributed in squads as occasion required, they repaired to their work. At 11 A. M. they ate dinner, and after that rested until 2 P. M. Work was then resumed, and continued until an hour before sunset, when the bell again tolled for the Angelus. After prayers and the rosary the Indians supped, and then were free to take part in a dance or some such

CLOISTERS AND BELL OF SAN FERNANDO.

innocent amusement. Their diet consisted of fresh beef or mutton in abundance, with vegetables and tortillas made of flour or corn-meal. They made drinks of the same ingredients, which were called *atole* and *pinole* respectively. Their dress consisted of a shirt of linen, a pair of pantaloons, and a woolen smock. The *alcaldes* and head workmen had also cloth clothes like those of the Spaniards; the women received every year two changes of under-clothing, a smock, and a new gown.

The Indians of California were not the sturdy warlike race of the eastern side of the

continent, nor did they possess the intelligence or partial civilization of the natives of the tableland of Mexico. They were originally of low intelligence and brutish habits. Besides what they obtained from fishing and hunting—in which they do not appear to have been specially dexterous—their food consisted largely of acorns, pine nuts, and the like, and their clothing was practically *nil*. Though neither as subtle nor as fierce as the Iroquois, Algonquins, and Hurons of Canada, with whom Parkman's brilliant pages have made us familiar, they were not wanting in cunning, treachery, or ferocity, and on more than one occasion the missionaries sealed their faith with their blood—a sacrifice from which, to their honor be it said, the Franciscans never flinched, any more than the followers of Ignatius.

As conversions made progress among the natives, and the young people, instructed from their childhood, came to maturity, they were taught various industries, besides farming. Ordinary smith's and carpenter's work they learned to do fairly well; their saddlery was of a superior sort, and is still sought for. As weavers, tailors, and shoemakers they would

to ships visiting the coast. From the proceeds the friars distributed to the Indians handkerchiefs, clothing, tobacco, rosaries, trinkets, etc., and employed the surplus profits in the embellishment of the churches, the purchase of musical instruments, pictures, ornaments for the altar, etc. Where lands were found suitable for the purpose the fathers established outlying farms as appurtenances of the particular Mission on which they were made to depend. At these were gathered considerable colonies of civilized Indians selected from the most reliable.

Besides instructing the natives and incidentally fulfilling the duties of parochial clergy, the Missions extended a bountiful hospitality to all travelers and wayfarers. Planted at intervals of about a day's journey, on the natural route of travel along the coast, they became the usual resting-place for all travelers in either direction. Horses were the only means of locomotion, and at the end of his hard day's ride the weary traveler stopped at the door of the Mission building as naturally, and with as little thought of intrusion, as one might now at a public hotel. Throwing his rein to an Indian *arriero*, he was received by the mis-

sionary priest, or in his absence by the sacristan, with the patriarchal hospitality that Abraham extended to Lot. A bath was provided, followed by a plentiful meal and a comfortable bed. He was at liberty to stay as long as his convenience required, and on leaving was provided with a fresh horse and directions, or, if needed, a guide, for his further journey. Perhaps it is a tradition from these early days, but travelers still speak

PRESENT CHAPEL OF SAN JUAN CAPISTRANO.

not perhaps have obtained recognition in Paris, London, or New York, but they made serviceable blankets, serapes, cloth, and shoes, and I have seen creditable specimens of their work in silver. Domestic animals were introduced and they increased with astonishing rapidity, and in the care and management of them the Indians became very dexterous and serviceable—in fact, some of the most skillful horsemen in the world.

Hides, tallow, grain, wine, and oil were sold

kindly of the hospitality of California.

Serus in cœlum redeat !

The Missions in this State were in all twenty-one. They may be said to have attained their maximum of prosperity during the first quarter of the present century. The Indian tribes of the coast, as far north as Sonoma, had by that time been reduced to pupillage at the various establishments described, and those of the younger generations had been sufficiently in-

structed in the simple arts of domestic life not only to carry on the various industries mentioned, but to make useful servants to the rancheros and white settlers, whose numbers, recruited from discharged and superannuated soldiers, a few voluntary—and some involun-

and sale. The cattle were valued mainly for their hides and tallow, which with soap and other exportable products were sold to vessels trading along the coast, and paid for in dry-goods, cutlery, tools, clothing, etc. The archives contain a good deal of statistical information as

tary—immigrants from Mexico, occasional trappers, runaway sailors, or other adventurous foreigners, *quos ratio dederat aut fors objecerat*, had by this time become sufficiently considerable to create a demand for such services. There were still wild tribes in the mountains, to the north and east, but they gave little trouble, and the friars seem to have lost the spirit of missionary enterprise which characterized the companions and immediate successors of Father Junipero, and settled down to a quiet life among their neophytes and white neighbors, producing from the soil all the necessities and many of the simple luxuries of life, and accumulating, for the Indian communities they governed, pastoral wealth, in the shape of countless herds of cattle, horses, sheep, goats, and swine.

The grain raised on the Mission ranches was threshed out, just as in Egypt and Mesopotamia twenty-five hundred or three thousand years ago, by spreading it on the ground and turning in a band of horses to trample it. A rude mill, generally turned by hand or by horse-power, furnished flour, though at two or three of the Missions water-power was utilized for this purpose. At each Mission gardens and orchards were inclosed, wherein, besides ordinary vegetables, fruits of various sorts were cultivated, including the fig, the orange, the olive, and the vine. The last two gave the missionaries oil and wine in abundance, for use

MISSION OF SAN JUAN CAPISTRANO.

to Mission products, but I am not aware that it has ever been tabulated. An idea of them may be formed from the statement that in the year 1820 the Mission cattle are quoted at 140,000 head; the horses at 18,000, the sheep at 190,000, etc. The average annual product of grain, from 1811 to 1820, is given at over 113,000 bushels.

But the increase of white settlers, bringing with them the wants, ambitions, and freedom of modern life, was incompatible with the continued success of institutions based, as the Missions were, on paternal authority. The Indians were infants in all respects except age and capacity for evil; and the settlers were subject to no restraints except those of the civil authority, which was of the weakest kind.

Contact and intercourse with them corrupted the Indians and relaxed the bonds of discipline among them. Moreover the broad acres and the vast herds of the Missions excited the cupidity of the settlers, who did not regard the property of the friars and Indians in the same light as that of white people. Under these influences the Mexican congress, in 1833, passed a law for secularizing the Missions, converting them into parishes, replacing the missionary priests by curates, and emancipating the Indians from their pupilage to the Church. Administrators were to be ap-

malign, that the Government became alarmed and suspended the operation of the law. But it was too late; the mischief had been accomplished and the establishments thenceforth visibly decayed. A traveler of 1840-41 says that at the Mission of San José as late as 1837 Father Gonzales turned over to the administrators 17,000 head of cattle, of which as many as 8000 remained unappropriated in 1840, as well as 200 horses and 9000 sheep, while four hundred Indians remained even at that late day gathered about the Mission. He was also much interested by a school, still in existence,

INTERIOR OF SAN LUIS REY.

pointed for the temporalities of the Missions, the proceeds of which, after a small allowance for the maintenance of the priest and the charges of public worship, were to be applied to public purposes.

Under this law the greedy politicians of the day were enabled to plunder the Missions pretty nearly to their heart's content. Administrators were appointed, who administered away the tangible property in favor of themselves and their friends with marvelous industry and celerity. People whose names were held in esteem among the colonists, members of the "first families," leaders in public opinion and public affairs, are recorded as having despoiled the Missions of their lands and cattle by wholesale. The desolation wrought was so rapid and complete, and its effects on the Indian population so

where sixty Indian children surprised him by their progress in elementary studies, especially arithmetic. In 1834 (after the secularization) San Luis Rey had an Indian population of 3500 and possessed over 24,000 cattle, 10,000 horses, and 100,000 sheep. It harvested 14,000 fanegas of grain and 200 barrels of wine. In the same year San José had 2300 neophytes, 20,000 cattle, 11,000 horses, and 19,000 sheep, and harvested 10,000 fanegas of grain and 60 barrels of wine.

The ruin of the Missions was completed by the American conquest. The few remaining Indians were speedily driven or enticed away, for the rough frontiersmen who came over the plains knew nothing of missionary friars or civilized Indians; they came here to squat on public land and respected no possession beyond 160

THE MISSION OF SAN LUIS REY, SAN DIEGO COUNTY.

acres, and that only in the hands of one familiar with the English language and modern weapons. None of the establishments retains its original character. Where population has grown up around the site, as at Santa Clara, San Francisco, and San Rafael, they became parish churches. At other places squatters took possession of them, extruding priest and mayor-domo impartially, and in more than one case even the churches were sacrilegiously degraded to the use of stables and the like. In others many parts of the buildings were demolished for the sake of the timber, tiles, and other building material they afforded.

The most extensive of the old establishments was that of San Luis Rey. I visited it with a companion in the summer of 1862. We left San Juan Capistrano at an early hour, and reached San Luis at about 2 P. M., without meantime meeting a human being or seeing a house or a fence. Our way had taken us along a faintly marked wagon trail in the rugged foothills of the Sierra, through tangled chemical and underbrush, crossed by many steep barrancas, which out of California would scarce be deemed practicable for wheels. After many hours of this monotonous travel we suddenly emerged from the chain of hills to the prospect of a charming valley, through which meandered a little stream of crystal water,

which after many windings found its way to the sea, which then opened on our sight, bounding the western horizon. In the middle of the valley, on a slight elevation, rose the towers of the old church, the red-tiled roof of which, and of the adjoining buildings of the ancient Mission, shone bright and ruddy in the glare of an almost tropical sun.

The landscape was magnificent, and we paused a short time to enjoy it before hastening on to examine the spot. The walls of the quadrangle remained in fair condition, and the graveled approach to the main entrance appeared so neat that I was persuaded it had lately been swept, and that I should find some inhabitants within. I effected an entrance without much difficulty, and wandered through the interior rooms and corridors searching for the aged sacristan my imagination had suggested; but I searched in vain. No shadow was cast there except my own; I heard no sound but the echo of my own footsteps. The inte-

INTERIOR OF SAN LUIS OBISPO.

SANTA YNEZ, SANTA BARBARA COUNTY.

rior court, once a garden, bright with flowers and the lustrous leaves of the orange and lemon tree, was rank with weeds and spontaneous vegetation; the fountain was dried up, and the walls which confined its basin split by the swelling roots of neglected and overgrown trees. Great spider webs hung from the columns of the corridor, and the stillness was broken only by the drowsy hum of dragonflies and humming-birds. I entered the venerable old church, and while endeavoring to accustom my eyes to the dim, uncertain light which shrouded its interior I was disturbed by the startled cry and hasty flight of an enormous owl, which left its perch over where the high altar had stood and rustled over to a window at the opposite end. I ascended one of the towers to the belfry, where I provoked another flight of unclean birds. The old chime of bells still hung there inscribed with the maker's name and "Boston, 1820," telling plainly of the intercourse of the old missionaries with the whaling fleets and the hide drogers which half a century ago wintered on the coast. Probably the order for these bells had been given in 1818, and they had been received, in pursuance of it, in 1821 or 1822. There was no express in those days between Boston and California; the journey was made *via* Cape Horn, and a couple of years elapsed between the departure and the return of a vessel. The Mission gardens, particularly that

in front of the main building, retained many traces of former beauty. But the hedgerows, once carefully trimmed, now grown rank and wild; the old rustic seats crumbling to decay; the vines and fruit trees, which for want of pruning had ceased to produce; and the garden flowers growing neglectedly—all told of decay and ruin. From the remains of the fountain two clear streams of water still issued, and from the little rivulet they formed, bordered with cress as green as an emerald, a lazy fish looked deliberately up at me without moving—so unaccustomed to man as not to fear him. Just before the American conquest this Mission had harbored an industrious Indian population of several thousand. It had been occupied by our troops as a military post during the Mexican war and for some time after its close. When it ceased to be so used the Government, as I have heard General Beale say, caused an estimate to be made of the expense of repairing and restoring it to its former condition. The figures were two millions of dollars, and the project of repairing was, of course, given over.

It stands there to-day, magnificent, even in its ruins, a monument of the piety, devotion, industry, and disinterestedness of the venerable monks who wear the habit and cord of St. Francis, and who were the first colonists of Alta California.

John T. Doyle.

A FAMILY CHAPEL (CAMULOS).

A ROMANCE OF MORGAN'S ROUGH RIDERS.

THE RAID, THE CAPTURE, AND THE ESCAPE.

I.

THE RAID.

IN the summer of 1863 when at Tullahoma, Tennessee, General Bragg's army was menaced by superior numbers in flank and rear, he determined to send a body of cavalry into Kentucky, which should operate upon Rosecrans's communications between Nashville and Louisville, break the railroads, capture or threaten all the minor depots of supplies, intercept and defeat all detachments not too strong to be engaged, and keep the enemy so on the alert in his own rear that he would lose or neglect his opportunity to embarrass or endanger the march of the army when its retrograde movement began. He even hoped that a part of the hostile forces before him might be thus detained long enough to prevent their participation in the battle which he expected to fight when he had crossed the Tennessee.

The officer whom he selected to accomplish this diversion was General John H. Morgan, whose division of mounted riflemen was well fitted for the work in hand. Equal in courage, dash, and discipline to the other fine cavalry commands which General Bragg had at his disposal, it had passed a longer apprenticeship in expeditionary service than had any other. Its rank and file was of that mettle which finds its natural element in active and audacious enterprise, and was yet thrilled with the fire of youth; for there were few men in the division over twenty-five years of age. It was imbued with the spirit of its commander and confided in his skill and fortune; no endeavor was deemed impossible or even hazardous when he led. It was inured to constant, almost daily, combat with the enemy, of all arms and under every possible contingency. During its four years of service the 2d Kentucky Cavalry, of which General Morgan was the first colonel, lost sixty-three commissioned officers killed and wounded; Company A of that regiment, of which Morgan was the first captain, losing during the war seventy-five men killed. It had on its muster-roll, from first to last, nearly two hundred and fifty men. The history of this company and regiment was scarcely exceptional in the command.

Morgan was beyond all men adapted to in-

dependent command of this nature. His energy never flagged, and his invention was always equal to the emergency. Boldness and caution were united in all that he undertook. He had a most remarkable aptitude for promptly acquiring a knowledge of any country in which he was operating; and as he kept it, so to speak, "in his head," he was enabled easily to extricate himself from difficulties. The celerity with which he marched, the promptness with which he attacked or eluded a foe, intensified the confidence of his followers, and kept his antagonists always in doubt and apprehension.

In his conference with General Bragg, Morgan differed with his chief regarding the full effect of a raid that should not be extended beyond the Ohio.

General Bragg desired it to be confined to Kentucky. He gave Morgan *carte blanche* to go where he pleased in that State and stay as long as he pleased; suggesting, among other things, that he capture Louisville. Morgan urged that while by such a raid he might so divert to himself the attention of General Henry M. Judah and the cavalry of Rosecrans that they would not molest General Bragg's retreat, he could do nothing, in this way, in behalf of the other equally important feature of the plan—the detention of troops that would otherwise strengthen Rosecrans in the decisive battle to be fought south of the Tennessee. He contended, moreover, that a raid into Indiana and Ohio, the more especially as important political elections were pending there, would cause troops to be withdrawn from Rosecrans and Burnside for the protection of those States. But General Bragg refused permission to cross the Ohio, and instructed Morgan to make the raid as originally designed.

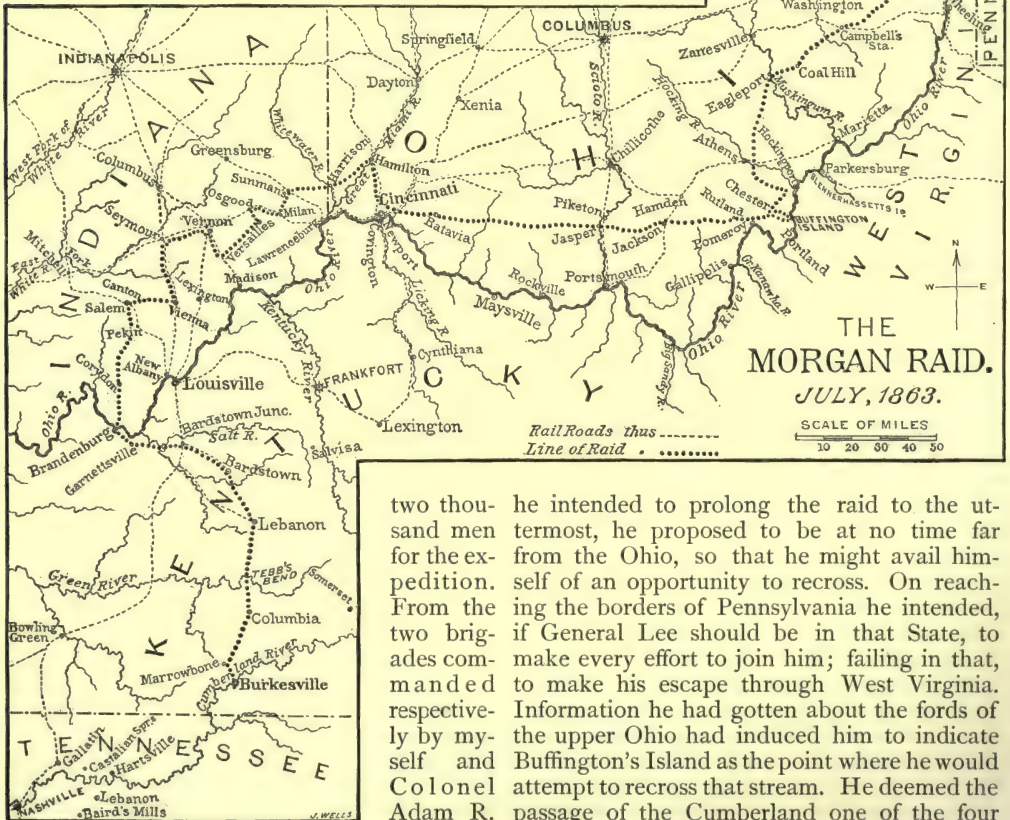

Some weeks previous to this conference, by Morgan's direction, I had sent competent men

GENERAL JOHN H. MORGAN.

to examine the fords of the upper Ohio. He had even then contemplated such an expedition. It had long been his conviction that the Confederacy could maintain the struggle only by transferring hostilities and waging war, whenever opportunity offered, on Northern soil. Upon his return from this interview he told me what had been discussed, and what were General Bragg's instructions. He said that he meant to disobey them; that the emergency, he believed, justified disobedience. He was resolved to cross the Ohio River and invade Indiana and Ohio. His command would probably be captured, he said; but in no other way could he give substantial aid to the army. General Bragg had directed Morgan to detail

ville, so closely approaching Louisville as to compel belief that he meant to attempt its capture. Turning to the right after entering Indiana, and marching as nearly due east as possible, he would reduce to a minimum the distance necessary to be covered, and yet threaten and alarm the population of the two States as completely as by penetrating deeply into them; more so, indeed, for pursuing this line he would reach the immediate vicinity of Cincinnati and excite fears for the safety of that city. While

two thousand men for the expedition. From the two brigades commanded respectively by myself and Colonel Adam R. Johnson,

he intended to prolong the raid to the utmost, he proposed to be at no time far from the Ohio, so that he might avail himself of an opportunity to recross. On reaching the borders of Pennsylvania he intended, if General Lee should be in that State, to make every effort to join him; failing in that, to make his escape through West Virginia. Information he had gotten about the fords of the upper Ohio had induced him to indicate Buffington's Island as the point where he would attempt to recross that stream. He deemed the passage of the Cumberland one of the four chief difficulties of the expedition that might prove really dangerous and insuperable; the other three were the passage of the Ohio, the circuit around Cincinnati, and the recrossing of the Ohio.

Morgan selected twenty-four hundred and sixty of the best mounted and most effective. He took with him four pieces of artillery, two 3-inch Parrotts, attached to the First Brigade, and two 12-pounder howitzers, attached to the Second.

I should state that Morgan had thoroughly planned the raid before he marched from Tennessee. He meant to cross the Cumberland in the vicinity of Burkesville, and to march directly across Kentucky to the nearest point at which he could reach the Ohio west of Louis-

Before noon on the 2d of July my brigade began to cross the Cumberland at Burkesville and at Scott's Ferry, two miles higher up the stream. The river, swollen by heavy and long-continued rains, was pouring down a volume of water which overspread its banks and rushed with a velocity that seemed to defy

any attempt to stem it. Two or three canoes lashed together and two small flats served to transport the men and the field-pieces, while the horses were made to swim. Many of them were swept far down by the boiling flood. This process was necessarily slow, as well as precarious. Colonel Johnson, whose brigade was crossing at Turkey Neck Bend, several miles below Burkesville, was scarcely so well provided with the means of ferriage as myself. About 3 P. M. the enemy began to threaten both brigades. Had these demonstrations been made earlier, and vigorously, we could not have gotten over the river. Fortunately by this time we had taken over the

6th Kentucky and 9th Tennessee of my brigade — aggregating nearly six hundred men — and also the two pieces of artillery. These regiments were moved beyond Burkesville and placed in a position which served all the purposes of an ambuscade. When the enemy approached, one or two volleys caused his column to recoil in confusion. General Morgan instantly charged it with Quirk's scouts and some companies of the 9th Tennessee, and not only prevented it from rallying but drove it all the way back to Marrowbone, entering the encampment there with the troops he was pursuing in a pell-mell dash. He was soon driven back, however, by the enemy's infantry and artillery.

The effect of this blow was to keep the enemy quiet for the rest of the day and night. The forces threatening Colonel Johnson were also withdrawn, and we both accomplished the passage of the river without further molestation. That night the division marched out on the Columbia road and encamped about two miles from Burkesville. On the next day Judah concentrated the three brigades of his cavalry command in that region, while orders were sent to all the other Federal detachments in Kentucky to close in upon our line of march.

General Bragg had sent with the expedition

THE FARMER FROM CALF-KILLER CREEK.

a large party of commissaries of subsistence, who were directed to collect cattle north of the Cumberland and drive them, guarded by one of our regiments, to Tullahoma. I have never understood how he expected us to be able, under the circumstances, to collect the cattle, or the foragers to drive them out. The commissaries did not attempt to carry out their instructions, but followed us the entire distance and pulled up in prison. They were gallant fellows and made no complaint of danger or hardship, seeming rather to enjoy it.

There was one case, however, which excited universal pity. An old farmer and excellent man, who lived near Sparta, had accompanied us to Burkesville — that is, he meant to go no farther, and thought we would not. He wished to procure a barrel of salt, as the supply of that commodity was exhausted in his part of the country. He readily purchased the salt, but learned, to his consternation, that the march to Burkesville was a mere preliminary canter. He was confronted with the alternative of going on a dangerous raid or of returning alone through a region swarming with the fierce bushwhackers of "Tinker Dave" Beattie, who never gave quarter to Confederate soldier or Southern sympathizer. He knew

that if he fell into their hands they would pickle him with his own salt. So this old man, sadly yet wisely, resolved to follow the fortunes of Morgan. He made the grand tour, was hurried along day after day through battle and ambush, dragged night after night on the remorseless march, ferried over the broad Ohio under fire of the militia and gunboats, and lodged at last in a "loathsome dungeon." On one occasion, in Ohio, when the home-guards were peppering us in rather livelier fashion than usual, he said to Captain C. H. Morgan, with tears in his voice: "I sw'ar if I would n't give all the salt in Kaintucky to stand once more safe and sound on the banks of Calkiller Creek."

Pushing on before dawn of the 3d, we reached Columbia in the afternoon. The place was occupied by a detachment of Colonel Frank Wolford's brigade, which was quickly driven out. Encamping that evening some eight miles from Columbia, we could hear all night the ringing of the axes near Green River bridge on the road from Columbia to Campbellsville. Three or four hundred of the 25th Michigan Infantry were stationed at the bridge to protect it. But the commander, Colonel Orlando H. Moore, deliberately quitting the elaborate stockade erected near the bridge,—in which nine officers out

of ten would have remained, but where we could have shelled him into surrender without losing a man ourselves,—selected one of the strongest natural positions I ever saw, and fortified it skillfully, although simply. The Green River makes here an immense horseshoe sweep, with the bridge at the toe of the horseshoe; and more than a mile south of it was the point where Colonel Moore elected to make his fight. The river there wound back so nearly upon its previous course that the peninsula, or "neck," was scarcely a hundred yards wide. This narrow neck was also very short, the river bending almost immediately to the west again. At that time it was thickly covered with trees and undergrowth, and Colonel Moore, felling the heaviest timber, had constructed a formidable abatis across the narrowest part of it. Just in front of the abatis there was open ground for perhaps two hundred yards. South of the open was a deep ravine. The road ran on the east side of the cleared place, and the banks of the river were high and precipitous. The center of the open space rose into a swell, sloping gently away both to the north and south. On the crest of the swell Moore had thrown up a slight earthwork, which was manned when we approached. An officer was promptly despatched with a flag to demand his surrender.

GENERAL DUKE TESTS THE PIES.

HOSPITALITIES OF THE FARM.

Colonel Moore responded that an officer of the United States ought not to surrender on the Fourth of July, and he must therefore decline. Captain "Ed." Byrne had planted one of the Parrott guns about six hundred yards from the earthwork, and on the return of the bearer of the flag opened fire, probing the work with a round shot. One man in the trench was killed by this shot and the others ran back to the abatis.

Colonel Johnson, whose brigade was in advance, immediately dashed forward with the 3d and 11th Kentucky to attack the main position. Artillery could not be used, for the guns could bear upon the abatis only from the crest of which I have spoken, and if posted there the cannoners, at the very short range, would not have been able to serve their pieces. The position could be won only by direct assault. The men rushed up to the fallen timber, but became entangled in the network of trunks and branches, and were shot down while trying to climb over or push through them. I reinforced Johnson with a part of Smith's regiment, the 5th Kentucky, but the jam and confusion incident to moving in so circumscribed an area and through the dense undergrowth broke the force of the charge. The enemy was quite numerous enough to defend

a line so short and strong and perfectly protected on both flanks. We had not more than six hundred men actually engaged, and the fighting lasted not longer than fifteen or twenty minutes. Our loss was about ninety, nearly as many killed as wounded. Afterward we learned that Colonel Moore's loss was six killed and twenty-three wounded. When General Morgan ordered the attack he was not aware of the strength of the position; nor had he anticipated a resistance so spirited and so skillfully planned. He reluctantly drew off without another assault, convinced that to capture the abatis and its defenders would cost him half his command. Among the killed were Colonel D. W. Chenault and Captain Alexander Treble of the 11th Kentucky, Lieutenant Robert Cowan of the 3d, and Major Thomas Y. Brent, Jr., and Lieutenants Holloway and Ferguson of the 5th. These officers were all killed literally at the muzzles of the rifles.

Colonel Moore's position might easily have been avoided; indeed, we passed around it immediately afterward, crossing the river at a ford about two miles below the bridge. Morgan assailed it merely in accordance with his habitual policy when advancing of attacking all in his path except very superior forces.

On the same afternoon Captain William

M. Magenis, assistant adjutant-general of the division, a valuable officer, was murdered by a Captain Murphy, whom he had placed under arrest for robbing a citizen. Murphy made his escape from the guard two or three days subsequently, just as the court-martial which was to have tried him was convening.

On the morning of July 5 the column reached Lebanon, which was garrisoned by the 20th Kentucky Infantry, commanded by Colonel Charles S. Hanson. The 8th and 9th Michigan Cavalry and the 11th Michigan Battery, under command of Colonel James I. David,

sixteen wounded, and three hundred and eighty were prisoners.

Without delay we passed through Springfield and Bardstown, crossing the Louisville and Nashville Railroad at Lebanon Junction, thirty miles from Louisville, on the evening of the 6th. At Springfield two companies of about ninety men were sent towards Harrodsburg and Danville to occupy the attention of the Federal cavalry in that quarter. From Bardstown, Captain W. C. Davis, acting assistant adjutant-general of the First Brigade, was sent with a detachment of one hundred

LOOKING FOR THE FOOTPRINTS OF THE VAN.

were approaching by the Danville road to reinforce the garrison, necessitating a large detachment to observe them. Morgan's demand for surrender having been refused, artillery fire was directed upon the railroad depot and other buildings in which the enemy had established himself; but, as the Federals endured it with great firmness, it became necessary to carry the town by assault. Our loss was some forty in killed and wounded, including several excellent officers. One death universally deplored was that of the General's brother, Lieutenant Thomas H. Morgan. He was a bright, handsome, and very gallant lad of nineteen, the favorite of the division. He was killed in front of the 2d Kentucky in the charge upon the depot. The Federal loss was three killed and

and thirty men to scout in the vicinity of Louisville, to produce the impression that the city was about to be attacked, and to divert attention from the passage of the Ohio by the main body at Brandenburg. He was instructed to cross the river somewhere east of Louisville and to rejoin the column on its line of march through Indiana. He executed the first part of the program perfectly, but was unable to get across the river. Tapping the wires at Lebanon Junction, we learned from intercepted despatches that the garrison at Louisville was much alarmed, and in expectation of an immediate attack.

The detachments I have just mentioned, with some smaller ones previously sent off on similar service, aggregated not less than two

hundred and sixty men permanently separated from the division; which, with a loss in killed and wounded, in Kentucky, of about one hundred and fifty, had reduced our effective strength, at the Ohio, by more than four hundred.

The rapid and constant marching already began to tell upon both horses and men, but we reached the Ohio at Brandenburg at 9 A. M. on the 8th. Captains Samuel Taylor and H. C. Meriwether of the 10th Kentucky had been sent forward the day before, with their companies, to capture steamboats. We found them in possession of two large craft. One had been surprised at the wharf, and steaming out on her they had captured the other. Preparations for crossing were begun; but, just as the first boat was about to push off, an unexpected musketry fire was opened from the Indiana side by a party of home-guards collected behind some houses and haystacks. They were in pursuit of Captain Thomas H. Hines, who had that morning returned from Indiana to Kentucky, after having undertaken a brief expedition of his own. This fire did no harm, the river here being eight hundred or a thousand yards wide. But in a few minutes the bright gleam of a field-piece spouted through the low hanging mist on the farther bank. Its shell pitched into a group near the wharf, severely wounding Captain W. H. Wilson, acting quartermaster of the First Brigade. Several shots from this piece followed in quick succession, but it was silenced by Lieutenant Lawrence with his Parrotts. The 2d Kentucky and 9th Tennessee were speedily ferried over without their horses, and forming under the bluff they advanced upon the militia, which had retired to a wooded ridge some six hundred yards from the river bank, abandoning the gun. The two regiments were moving across some open ground, towards the ridge, sustaining no loss from the volleys fired at them, and the boats had scarcely returned for further service when a more formidable enemy appeared. A gunboat, the *Elk*, steamed rapidly round the bend and began firing alternately upon the troops in the town and those already across. The situation was now extremely critical. We could not continue the ferriage while this little vixen remained, for one well-directed shot would have sent either of the boats to the bottom. Delay was extremely hazardous, affording the enemy opportunity to cut off the regiments we had already sent over, and giving the cavalry in pursuit of us time to come up. If forced to give up the attempt to cross the river, we must also abandon our comrades on the other side. So every piece of artillery was planted and opened on the gunboat, and after an hour or two of vigorous cannonading she was driven off. By midnight all our troops were over.

VOL. XLI.—54.

About noon of the 9th the column reached the little town of Corydon, Indiana, which proved not nearly so gentle as its name. Our advance-guard, commanded by Colonel R. C. Morgan, found a body of militia there, ensconced behind stout barricades of fence rails, stretching for some distance on each side of the road. Colonel Morgan charged the barricade, his horses could not leap it, the militia stood resolutely, and he lost sixteen men. A few dismounted skirmishers thrown upon the flanks, and a shot or two from one of the pieces which accompanied the advance-guard, quickly dispersed them, however, and we entered the town without further resistance.

Our progress, quite rapid in Kentucky, was now accelerated, and we were habitually twenty-one hours out of the twenty-four in the saddle, very frequently not halting at night or going into camp at all. For the first three or four days we saw nothing of the inhabitants save in their character as militia, when they forced themselves on our attention much more frequently than we desired. The houses were entirely deserted. Often we found the kitchen fire blazing, the keys hanging in the cupboard lock, and the chickens sauntering about the yard with a confidence which proved that they had never before seen soldiers.

As the first scare wore off, however, we found the women and children remaining at home, while the men went to the muster. When a thirsty cavalryman rode up to a house to inquire for buttermilk he was generally met by a buxom dame, with a half-dozen or more small children peeping out from her voluminous skirts, who, in response to a question about the "old man," would say, "The men hev all gone to the 'rally'; you'll see 'em soon." We experienced little difficulty in procuring food for man and horse. Usually upon our raids it was much easier to obtain meat than bread. But in Indiana and Ohio we always found bread ready baked at every house. In Ohio, on more than one occasion, in deserted houses we found pies, hot from the oven, displayed upon tables conveniently spread. The first time that I witnessed this sort of hospitality was when I rode up to a house where a party of my men were standing around a table garnished as I have described, eying the pies hungrily, but showing no disposition to touch them. I asked, in astonishment, why they were so abstinent. One of them replied that they feared the pies might be poisoned. I was quite sure, on the contrary, that they were intended as a propitiatory offering. I have always been fond of pies,—these were of luscious apples,—so I bade the spokesman hand me one of the largest, and proceeded to eat it. The men watched me vigilantly for two or three minutes,

and then, as I seemed much better after my repast, they took hold ravenously.

The severe marching made an exchange of horses a necessity, though as a rule the horses we took were very inferior to the Kentucky and Tennessee stock we had brought with us, and which had generally a large infusion of thoroughbred blood. The horses we impressed were for the most part heavy, sluggish beasts, barefooted and grass fed, and gave out after a day or two, sometimes in a few hours. A strong provost guard, under Major Steele of the 3d Kentucky, had been organized to prevent the two practices most prejudicial to discipline and efficiency—straggling and pillage. There were very good reasons, independent of the provost guard, why the men should not straggle far from the line of march; but the well-filled stores and gaudy shop windows of the Indiana and Ohio towns seemed to stimulate, in men accustomed to impoverished and unpretentious Dixie, the propensity to appropriate beyond limit or restraint. I had never before seen anything like this disposition to plunder. Our perilous situation only seemed to render the men more reckless. At the same time, anything more ludicrous than the manner in which they indulged their predatory tastes can scarcely be imagined. The weather was intensely warm,—the hot July sun burned the earth to powder, and we were breathing superheated dust,—yet one man rode for three days with seven pairs of skates slung about his neck; another loaded himself with sleighbells. A large chafing dish, a medium-sized Dutch clock, a green glass decanter with goblets to match, a bag of horn buttons, a chandelier, and a bird-cage containing three canaries, were some of the articles I saw borne off and jealously fondled. The officers usually waited a reasonable period, until the novelty had worn off, and then had this rubbish thrown away. Babyshoes and calico, however, were the staple articles of appropriation. A fellow would procure a bolt of calico, carry it carefully for a day or two, then cast it aside and get another.

From Corydon our route was *via* Salem, Vienna, Lexington, Paris, Vernon, Dupont, and Sumanville to Harrison, near the Ohio State line and twenty-five miles from Cincinnati. Detachments were sent to Madison, Versailles, and other points, to burn bridges, bewilder and confuse those before and behind us, and keep bodies of militia stationary that might otherwise give trouble. All were drawn in before we reached Harrison. At this point Morgan began demonstrations intended to convey the impression that he would cross the Cincinnati, Hamilton and Dayton Railroad at Hamilton. He had always anticipated difficulty in getting over this road; fearing that

the troops from Kentucky would be concentrated at or near Cincinnati, and that every effort would be made to intercept him there. If these troops lined the railroad and were judiciously posted, he knew it would be extremely difficult to elude them or cut his way through them. He believed that if he could pass this ordeal safely the success of the expedition would be assured, unless the river should be so high that the boats would be able to transport troops to intercept him at the upper fords.

After remaining at Harrison two or three hours, and sending detachments in the direction of Hamilton, he moved with the entire column on the Hamilton road. But as soon as he was clear of the town he cut the telegraph wires—previously left intact with the hope that they might be used to convey intelligence of his apparent movement towards Hamilton—and, turning across the country, gained the direct road to Cincinnati. He hoped that, deceived by his demonstrations at Harrison, the larger part of the troops at Cincinnati would be sent to Hamilton, and that it would be too late to recall them when his movement towards Cincinnati was discovered. He trusted that those remaining would be drawn into the city, under the impression that he meant to attack, leaving the way clear for his rapid transit. He has been criticized for not attempting the capture of Cincinnati, but he had no mind to involve his handful of wearied men in a labyrinth of streets. We felt very much more at home amid rural surroundings. But if he had taken Cincinnati, and had safely crossed the river there, the raid would have been so much briefer, and its principal object to that extent defeated by the release of the troops pursuing us.

We reached the environs of Cincinnati about ten o'clock at night, and were not clear of them until after daybreak. My brigade was marching in the rear, and the guides were with General Morgan in the front. The continual straggling of some companies in the rear of Johnson's brigade caused me to become separated from the remainder of the column by a wide gap, and I was for some time entirely ignorant of what direction I should take. The night was pitch dark, and I was compelled to light torches and seek the track of the column by the foam dropped from the mouths of the horses and the dust kicked up by their feet. At every halt which this groping search necessitated, scores of tired men would fall asleep and drop out of their saddles. Daylight appeared after we had crossed all of the principal suburban roads, and were near the Little Miami Railroad. I never welcomed the fresh, invigorating air of morning more gratefully. That afternoon we reached Williamsburg, twenty-eight miles east of Cincinnati.

The Ohio militia were more numerous and aggressive than those of Indiana. We had frequent skirmishes with them daily, and although hundreds were captured, they resumed operations as soon as they were turned loose. What excited in us more astonishment than all else we saw were the crowds of able-bodied men. The contrast with the South, drained of adult males to recruit her armies, was striking, and suggestive of anything but confidence on our part in the result of the struggle.

At Piketon we learned that Vicksburg had fallen, and that General Lee, having been repulsed at Gettysburg, had retreated across the Potomac. Under the circumstances this information was peculiarly disheartening. As we approached Pomeroy the militia began to embarrass our march by felling trees and erecting barricades across the roads. In passing near that town we were assailed by regular troops, — as we called the volunteers in contradistinction to the militia, — and forced a passage only by some sharp fighting. At 1 p. m. on the 18th we reached Chester, eighteen miles from Bufington's Island. A halt here of nearly two hours proved disastrous, as it caused us to arrive at the river after nightfall, and delayed any attempt at crossing until the next morning. Morgan thoroughly appreciated the importance of crossing the river at once, but it was impossible. The darkness was intense, we were ignorant of the ford and without guides, and were encumbered with nearly two hundred wounded, whom we were unwilling to abandon. By instruction I placed the 5th and 6th Kentucky in position to attack, as soon as day broke, an earthwork commanding the ford, and which we learned was mounted with two guns and manned by three hundred infantry. At dawn I moved upon the work, and found it had been evacuated and the guns thrown over the bluff. Pressing on a few hundred yards to reconnoiter the Pomeroy road, we suddenly encountered the enemy. It proved to be General Judah's advance. The 5th and 6th Kentucky instantly attacked and dispersed it, taking a piece of artillery and forty or fifty prisoners, and inflicting some loss in killed and wounded.

The position in which we found ourselves, now that we had light enough to examine the ground, was anything but favorable. The valley we had entered, about a mile long and perhaps eight hundred yards wide at its southern extremity, — the river running here nearly due north and south, — gradually narrows, as the ridge which is its western boundary closely approaches the river bank, until it becomes a mere ravine. The Chester road enters the valley at a point about equidistant from either end. As the 5th Kentucky fell back that it might be aligned on the 6th Kentucky, across

the southern end of the valley, into which Judah's whole force was now pouring, it was charged by the 8th and 9th Michigan and a detachment of the 5th Indiana. A part of the 5th Kentucky was cut off by this charge, the gun we had taken was recaptured, and our Parrotts also fell into the hands of the enemy. They were so clogged with dust, however, as to be almost unserviceable, and their ammunition was expended. Bringing up a part of the 2d Kentucky, I succeeded in checking and driving back the regiments that first bore down on us, but they were quickly reinforced and immediately returned to the attack. In the meantime Colonel Johnson's videttes on the Chester road had been driven in, and the cavalry under Hobson, which had followed us throughout our long march, deployed on the ridge, and attacked on that side. I sent a courier to General Morgan, advising that he retreat up the river and out of the valley with all the men he could extricate, while Colonel Johnson and I, with the troops already engaged, would endeavor to hold the enemy in check. The action was soon hot from both directions, and the gunboats, steaming up the river abreast of us, commenced shelling vigorously. We were now between three assailants. A sharp artillery fire was opened by each, and the peculiar formation we were compelled to adopt exposed us to a severe cross-fire of small arms.

We were in no condition to make a successful or energetic resistance. The men were worn out and demoralized by the tremendous march, and the fatigue and lack of sleep for the ten days that had elapsed since they had crossed the Ohio. Having had no opportunity to replenish their cartridge-boxes, they were almost destitute of ammunition, and after firing two or three rounds were virtually unarmed. To this fact is attributable the very small loss our assailants sustained. Broken down as we were, if we had been supplied with cartridges we could have piled the ground with Judah's men as they advanced over the open plain into the valley. As the line, seeking to cover the withdrawal of the troops taken off by General Morgan, was rolled back by the repeated charges of the enemy, the stragglers were rushing wildly about the valley, with bolts of calico streaming from their saddles, and changing direction with every shrieking shell. When the rear-guard neared the northern end of the valley — out of which General Morgan with the greater part of the command had now passed — and perceived that the only avenue of escape was through a narrow gorge, a general rush was made for it. The Michigan regiments dashed into the mass of fugitives, and the gunboats swept the narrow pass with grape. All order was lost in a wild tide of flight.

About seven hundred were captured here, and perhaps a hundred and twenty killed and wounded. Probably a thousand men got out with General Morgan. Of these some three hundred succeeded in swimming the river at a point twenty miles above Buffington, while many were drowned in the attempt. The arrival of the gunboats prevented others from crossing. General Morgan had gotten nearly over, when, seeing that the bulk of his command must remain on the Ohio side, he returned. For six more days Morgan taxed energy and ingenuity to the utmost to escape the toils. Absolutely exhausted, he surrendered near the Pennsylvania line, on the 26th day of July, with 364 men.

The expedition was of immediate benefit since a part of the forces that would otherwise have harassed Bragg's retreat and swollen Rosecrans's muster-roll at Chickamauga were carried by the pursuit of Morgan so far northward that they were kept from participating in that battle.

But Morgan's cavalry was almost destroyed, and his prestige impaired. Much the larger number of the captured men lingered in the Northern prisons until the close of the war. That portion of his command which had remained in Tennessee became disintegrated; the men either were incorporated in other organizations, or, attracted by the fascinations of irregular warfare, were virtually lost to the service. Morgan, after four or five months' imprisonment in the Ohio penitentiary, effected an escape which has scarcely a parallel for ingenuity and daring [see page 417]. He was received in the South enthusiastically. The authorities at Richmond seemed at first to share the popular sympathy and admiration. But it

soon became apparent that his infraction of discipline in crossing the Ohio was not forgiven. Placed for a short time in practical command of the Department of Southwestern Virginia, he was given inadequate means for its defense, and bound with instructions which accorded neither with his temperament nor with his situation. The troops he commanded were not, like his old riders, accustomed to his methods, confident in his genius, and devoted to his fortunes. He attempted aggressive operations with his former energy and self-reliance, but not with his former success. He drove out of West Virginia two invading columns, and then made an incursion into the heart of Kentucky—known as his last Kentucky raid—in the hope of anticipating and deterring a movement into his own territory. Very successful at first, this raid ended, too, in disaster. After capturing and dispersing Federal forces in the aggregate much larger than his own, he encountered at Cynthiana a vastly superior force, and was defeated. Two months later, September 4, 1864, he was killed at Greeneville, Tennessee, while advancing to attack the Federal detachments stationed in front of Knoxville.¹ The remnant of his old command served during the gloomy winter of 1864-65 in the region where their leader met death, fighting often on the same ground. When Richmond fell and Lee surrendered they marched to join Joseph E. Johnston. After his capitulation they were part of the escort that guarded Jefferson Davis in his aimless retreat from Charlotte, and laid down their arms at Woodville, Georgia, by order of John C. Breckinridge, when the armies of the Confederacy were disbanded and its President became a fugitive.

Basil W. Duke.

¹ E. W. Doran of Greeneville, Tenn., gives the following particulars of General Morgan's death:

General Morgan came to Greeneville on September 3, and stationed his troops on a hill overlooking the town from the east, while he and his staff were entertained at the "Williams Mansion," the finest residence in town. At this time Captain Robert C. Carter, in command of a company of Colonel Crawford's regiment, was stationed three or four miles north of the town. He got accurate information of Morgan's whereabouts, and sent a messenger at once to General A. C. Gillem, at Bull's Gap, sixteen miles distant. This message was intrusted to John Davis and two other young men of his company, who rode through a fearful storm, picking their way by the lightning flashes and arriving there sometime before midnight. Other messages were probably sent to Gillem that night from

Greeneville, but this was the first received. The report usually given in the histories to the effect that Mrs. Joseph Williams carried the news is not correct, as she was known to be in an opposite direction several miles, and knew nothing of the affair. In an hour after the message was delivered Gillem's forces were hurrying on their way to Greeneville, where they arrived about daylight, and surrounded the house where Morgan was. He ran out, without waiting to dress, to conceal himself in the shrubbery and grape arbors, but was seen from the street and shot by Andrew G. Campbell, a private in the 13th Tennessee. Campbell was promoted to a lieutenancy. Morgan's body was afterward secured by his friends and given decent burial. But little firing was done by either army; and after Morgan was killed his forces marched out of town while the Union forces marched in, in easy range of each other, yet not a shot was fired on either side.

II.—THE CAPTURE.

WHEN it was known at Indianapolis that General Morgan, with a large force, had crossed the Ohio, the city was panic-stricken. The State had been literally depleted of troops to assist Kentucky, and everybody knew it.

The very worst was apprehended—that railways would be cut up, passenger and freight trains robbed, bridges and depots burned, our arsenal pillaged, two thousand Confederate prisoners at Camp Morton liberated, and Jef-

fersonville, with all its Government stores, and possibly Indianapolis itself, destroyed.

Nor was this all. It had been reported, and partly believed, as afterward proved to be the fact, that the State was undermined with rebel sympathizers banded together in secret organizations. The coming of Morgan had been looked for, and his progress through Kentucky watched with anxiety. It was predicted that hundreds, perhaps thousands, of "Knights of the Golden Circle" and "Sons of Liberty" would flock to his standard and endeavor to carry the State over to the Confederacy. Morgan probably had fair reason to believe that his ranks would be at least largely recruited in the southern counties of Indiana. The governor of Indiana, Oliver P. Morton, went to work with all his tremendous energy and indomitable will, in the face of the greatest opposition that had been encountered in any Northern State, amounting, just before, almost to open rebellion. He proclaimed martial law, though not in express terms, and ordered out the "Legion," or militia, and called upon the loyal citizens of the State to enroll themselves as minute-men, to organize and report for arms and for martial duty. Thousands responded to the call within twenty-four hours—many within two hours.¹ Everything possible was done by telegraph, until the lines were cut. Some arms were found in the State Arsenal, and more, with accoutrements and ammunition, together with whole batteries of artillery, were procured from Chicago and St. Louis.

The disposition of the State levies that came thronging in was left to me as fast as they were armed. The three great junctions of the Ohio and Mississippi Railroad in Indiana, over which troops and supplies were shipped from all points to Rosecrans at Chattanooga, *viz.*: Mitchell, Seymour and Vernon, were first to be made secure; for surely Morgan must have some military objectives, and these appeared to be the most likely. The westerly junction was Mitchell. This was quickly occupied and guarded by General James Hughes with Legion men, reinforced by the new organizations rising in that quarter. Seymour was the most central, and lay directly on the road to Cincinnati and Indianapolis from Louisville; and to Seymour a brigade was assembled from the center of the State, with General John Love, a skillful old army officer, to command it, with instructions to have an eye to Vernon likewise. To this last point Burnside ordered a battery from Cincinnati; and what few troops

I had in Michigan, though half organized, came down to Vernon and to General Love. Besides these thus rendezvoused, the people of the southern counties were called upon to bushwhack the enemy, to obstruct roads, to guard trains, bridges, etc., and make themselves generally useful and pestiferous.

Our militia first came in contact with the enemy opposite Brandenburg, where he crossed; but it made the first stand at Corydon Junction, where the road runs between two abrupt hills, across which Colonel Lewis Jordan threw up some light intrenchments. Morgan's advance attempted to ride over these "rail-piles" rough shod, but lost some twenty troopers unhorsed. They brought up their reserve and artillery, flanked, and finally surrounded Colonel Jordan, who, after an hour's resolute resistance, surrendered.

This gave the raiders the town, and the citizens the first taste of Morgan's style, which somewhat disgusted the numerous class of Southern sympathizers. The shops were given up to plunder, and the ladies were levied on for meals for the whole command.

Throwing out columns in various directions, Morgan pushed for Mitchell, where no doubt he expected to cut the Ohio and Mississippi Railroad, got as far as Salem in that direction, captured or dispersed a few squads of badly armed minute-men who were guarding depots and bridges, which he burned, and doubtless hearing from his scouts, sent out in citizens' clothes, of Hughes's force collected at Mitchell, he discreetly turned off northeastward, apparently aiming next for Seymour. This I heard with great satisfaction.

The panic at Indianapolis began to subside. Still I felt uneasy for Seymour, as I next heard of Morgan at Vienna, where he tapped the telegraph lines and learned what he could of all our plans to catch him. He came within nine miles of Seymour. General Love sent out a reconnaissance of sharpshooters under Colonel C. V. DeLand, with a couple of field-pieces. They found that Morgan had turned off eastward. Love divined his object, and started DeLand and two Indiana regiments of militia for Vernon. Here Morgan next turned up, planted his Parrotts, and demanded surrender. He was defied until Love's arrival with the rest of his militia, and then he swept off in a hurry from Vernon, followed by our men, who captured his pickets and rear-guard, but who, having no cavalry, were soon outmarched.

Morgan secured a great advantage by seiz-

¹ According to the report of the adjutant-general of Indiana 30,000 militia assembled within thirty-six hours, and about the time Morgan was leaving the State 65,000 men were in the field. In Ohio, according to a report made to the adjutant-general, 55,000 militia

turned out; many of them refused pay, yet \$232,000 were disbursed for services during the raid. It would appear, therefore, that 120,000 militia took the field against Morgan in addition to the three brigades of General Judah's United States cavalry.—EDITOR.

ing all the horses within reach,¹ leaving none for the militia or for General E. H. Hobson, which enabled him to gain on his pursuers, and he would then have left Hobson far out of sight but for the home guard, who obstructed the roads somewhat and bushwhacked his men from every hedge, hill, or tree, when it could be done. But the trouble was that we could not attack him with sufficient organized numbers.

After he left Vernon we felt safe at Indianapolis. "Defensive sites" were abandoned, and the banks brought back their deposits which they had sent off by express to Chicago and the North. Some fears, or hopes, were now entertained as to Madison, towards which Morgan next bent his way—fears for the safety of that city, and hopes that, with the help of Judah's troops and the gunboats now on the way up the river, we might put an end to the raid. From Indianapolis we started General Lew Wallace with a good brigade of minutemen, and with high hopes that at either Madison or Lawrenceburg, farther up the river, he might "capture them." The people ahead were asked by telegraph to coöperate. But after going down that line as far as Dupont, Morgan turned northeast for Versailles, where we next heard of him threatening the Cincinnati and Indianapolis Railway. This was a nice bit of work. He baffled all our calculations and did some damage on both the Ohio and Mississippi and Cincinnati railroads, sending off flying columns in a dozen directions at a time for the purpose, as well as to throw Hobson off the scent. Some of these columns looked like traveling circuses adorned with useless plunder and an excess of clowns. Thus they went through Pierceville and Milan to Harrison, on White River, and on the Ohio line. Here Hobson's advance came upon them, but unfortunately it paused to plant artillery, instead of dashing across the bridge and engaging the raiders until the main body should arrive. This lost us the bridge, which was burned before our eyes, and many hours' delay, marching round by the ford. Their next demonstration was towards Hamilton. Here there was a fine railway bridge over the Big Miami. Hobson followed in such close pursuit through New Baltimore, Glendale, and Miamiville that the raiders did little damage. Their attempt to burn a bridge at Miamiville was repulsed by the home guard. My last troops were despatched from Indianapolis to head them off at Hamilton, after five hours' delay caused by

the intoxication of their commander. His successor in command was General Hascall, who swore like a trooper to find himself "just in time to be too late." He proceeded through Hamilton, Ohio, as far as Loveland. But Morgan had sent only a detachment towards Hamilton to divert attention from Cincinnati, towards which he made a rapid march with his whole united force.

Governor Tod of Ohio had already called out the militia and proclaimed martial law. He raised men enough, but Burnside had to organize and arm them. Morgan found the great city guarded, but he passed through the very suburbs by a night march around it, unmolested. He crossed the Little Miami Railroad at daylight, and came north in sight of Camp Dennison, where Colonel Neff half armed his convalescents, threw out pickets, dug rifle-pits, and threw up intrenchments. His fiery old veterans saved a railway bridge and actually captured a lieutenant and others before they sheered off and went some ten miles northward to Williamsburg. From that point they seemed to be steering for the great bend of the Ohio at Pomeroy.

In the vicinity of Cincinnati, Colonel W. P. Sanders, the splendid raider of East Tennessee, came up from Kentucky with some Michigan cavalry and joined Hobson in pursuit, and these were about the only fresh horses in the chase. Sanders had come by steamer, and, landing at Cincinnati, had been thrown out from there, it was hoped, ahead of Morgan, who, however, was too quick for him. They met later on.

Under the good management of Colonel A. V. Kautz in advance, with his brigade, and of Sanders, the men now marched more steadily and gained ground. Kautz had observed how the other brigade commanders had lost distance and blown their horses by following false leads, halting and closing up rapidly at the frequent reports of "enemy in front," and by stopping to plant artillery. Marching in his own way at a steady walk, his brigade forming the rear-guard, he had arrived at Batavia two hours before the main body, that had been "cavorting round the country" all day, "misled by two citizen guides"—possibly Morgan's own men.

Not stopping to draw the rations sent out to him from Cincinnati, Hobson urged his jaded horses through Brown, Adams, and Pike counties, now under the lead of Kautz, and reached Jasper on the Scioto at midnight of

¹ General J. M. Shackelford says in his official report: "Our pursuit was much retarded by the enemy's burning all the bridges in our front. He had every advantage. His system of horse-stealing was perfect. He would despatch men from the head

of each regiment, on each side of the road, to go five miles into the country, seizing every horse, and then fall in at the rear of the column. In this way he swept the country for ten miles of all the horses."

—EDITOR.

the 16th, Morgan having passed there at sundown. The next day they raced through Jackson. On the 18th Hobson, at Rutland, learned that Morgan had been turned off by the militia at Pomeroy and had taken the Chester road for Portland and the fords of the Ohio. The chase became animated. Our troopers made a march of fifty miles that day and still had twenty-five miles to reach Chester. They arrived there without a halt at eleven at night, and had still fifteen miles to reach the ford. They kept on, and at dawn of the 19th struck the enemy's pickets. Two miles out from Portland, Morgan was brought to bay — and not by Hobson alone. First came the militia, then came Judah. His division had pushed up the river in steamers parallel with Morgan's course. Lieutenant John O'Neil, afterwards of Fenian fame, with a troop of Indiana cavalry, kept up the touch on Morgan's right flank by a running fight, stinging it at every vulnerable point, and reporting Morgan's course to Judah in the neck and neck race. Aided by the local militia, O'Neil now dashed ahead and fearlessly skirmished with the enemy's flankers from every coign of vantage. He reached the last descent to the river bottom near Buffington Bar, and near the historical Blennerhasset's Island, early on the morning of the 19th.

The Ohio River was up. It had risen unexpectedly. But here Morgan must cross, if at all. It could not be forded by night, when he got here. He tried the ford at Blennerhasset. Failing in this, his men collected flatboats and set to work calking them, meantime sending a party to Buffington Bar, where they found a small earthwork and captured its guard; and these things delayed them until morning. General Judah attempted a reconnaissance, resulting in a fight, which he describes as follows in his report:

Before leaving Pomeroy I despatched a courier to General Hobson, apprising him of my direction, and requesting him to press the enemy's rear with all the forces he could bring up. Traveling all night, I reached the last descent to the river bottom at Buffington Bar at 5.30 A. M. on the 19th. Here, halting my force and placing my artillery in a commanding position, I determined to make a reconnaissance in person, for the purpose of ascertaining if a report just made to me—that the gunboats had left on a previous evening, the home guards had retreated, and that the enemy had been crossing all night—was true. A very dense fog enveloped everything, confining the view of surrounding objects to a radius of about fifty yards. I was accompanied by a small advance guard, my escort, and one piece of Henshaw's battery, a section of which, under Captain Henshaw, I had ordered to join my force. I advanced slowly and cautiously along a road leading toward the river, . . . when my little force found itself enveloped on three sides—front and both flanks—by three regiments, dismounted,

and led by Colonel Basil [W.] Duke, just discernible through the fog, at a distance of from fifty to a hundred yards. This force, as I afterward learned, had been disposed for the capture of the home guards, intrenched on the bank of the river. To use Colonel Duke's own expression after his capture, "He could not have been more surprised at the presence of my force had it dropped from the clouds." As soon as discovered, the enemy opened a heavy fire, advancing so rapidly that before the piece of artillery could be brought into battery it was captured, as were also Captain R. C. Kise, my assistant adjutant-general, Captain Grafton, volunteer aide-de-camp, and between twenty and thirty of my men. Two privates were killed. Major McCook (since dead), paymaster and volunteer aide-de-camp,¹ Lieutenant F. G. Price, aide-de-camp, and ten men were wounded. Searching in vain for an opening through which to charge and temporarily beat back the enemy, I was compelled to fall back upon the main body, which I rapidly brought up into position, and opened a rapid and beautifully accurate artillery fire from the pieces of the 5th Indiana upon a battery of two pieces, which the enemy had opened upon me, as well as upon his deployed dismounted force in line. Obstructing fences prevented a charge by my cavalry. In less than half an hour the enemy's lines were broken and in retreat. The advance of my artillery, and a charge of cavalry, made by Lieutenant O'Neil, 5th Indiana Cavalry, with only fifty men, converted his retreat into a rout, and drove him upon General Hobson's forces, which had engaged him upon the other road. His prisoners, the piece of artillery lost by me, all of his own artillery (five pieces), his camp equipage, and transportation and plunder of all kinds, were abandoned and captured. We also captured large numbers of prisoners, including Colonels Basil [W.] Duke, Dick [R. C.] Morgan, and Allen [Ward?], and the most of General Morgan's staff.

Yet with a considerable force Morgan succeeded in making his escape, and started into the interior like a fox for cover. Passing around the advanced column of his enemy he suddenly came upon the end of Shackelford's column, under Wolford, whom he at once attacked with his usual audacity. Shackelford reversed his column, selected his best horses, and gave pursuit. He overtook the enemy at Backum Church, where Wolford's Kentucky fellows rushed upon Morgan's men with drawn sabers and Kentucky yells, and chased them until next afternoon, when they were found collected on a high bluff, where some hundreds surrendered; but Morgan again escaped, and with over six hundred horsemen gave our fellows a long chase yet by the dirt road and by rail. Continuing north through several counties, he veered northwest towards the Pennsylvania line, even now burning buildings, carloads of freight, and bridges by the way,

1 Major Daniel McCook, father of the famous fighting family, who pushed himself in against remonstrance, to find the slayer of his son (General Robert L. McCook), reported to be with Morgan.

though hotly hounded by Shackelford, and flanked and headed off by troops in cars.

Among the latter was Major W. B. Way, of the 9th Michigan, with a battalion of his regiment. Way had left the cars at Mingo and marched over near to Steubenville,¹ where he began a skirmish which lasted over twenty-five miles towards Salineville, away up in Columbiana County. Here he brought Morgan to bay. The latter still fought desperately, losing 200 prisoners and over 70 of his men killed or wounded, and skipped away. Another Union detachment came up by rail under Major George W. Rue, of the 9th Kentucky Cavalry, joined Shackelford at Hammondsville, and took the advance with three hundred men.

¹ The Editor has received from E. E. Day the following account of Morgan's brief stay at Winterville:

Defeated at Buffington Bar, Morgan abandoned his plan of making a watering trough of Lake Erie, and fled north through the tier of river counties, keeping within a few miles of the Ohio. The river was low, but not fordable except at Cox's Riffle, a few miles below Steubenville. Headed at this point also, he struck across the country and passed through Winterville, a small village five miles west of Steubenville. That was a memorable Saturday in Winterville. Morgan's progress across the State had been watched with the most feverish anxiety, and the dread that the village might lie in his path filled the hearts of many. The wildest rumors passed current. Morgan and his "guerrillas," it was said, would kill all the men, lay the village in ashes, and carry off the women and children. The militia, or "hundred-day men," who lived in or near the village, drilled in the village streets, and fired rattling volleys of blank cartridges at a board fence, in preparation for the coming conflict. On Friday evening word came that Morgan would attempt to force a passage at Cox's Riffle the next morning, and the militia marched to Steubenville to help intercept him. A bloody battle was expected. About the middle of the forenoon a horseman dashed into the village shouting: "Morgan's coming! He's just down at John Hanna's!" and galloped on to warn others. Mr. Hanna was a farmer living about a mile south of the village. He had shouldered his musket and gone with the militia, leaving his wife and two children at home. About ten o'clock Morgan's men were seen coming up the road. Mrs. Hanna with her children attempted to reach a neighbor's, but they were overtaken and ordered to the house, which they found full of soldiers. Morgan and his officers were stretched, dusty clothes, boots and all, upon her beds, and a negro was getting dinner. While the third table was eating, a squad of militiamen appeared on a neighboring hill. Morgan ordered their capture, saying, "What will those Yankees do with the thousand men I have?" A number of Morgan's men started to carry out their chief's command, but the militia made good their escape. Soon after, word came that Shackelford's men were near, and Morgan left so hurriedly that he neglected to take the quilts and blankets his men had selected.

In the village all was consternation. Many of the women and children gathered at the Maxwell Tavern. Their terror upon hearing that Morgan was "just down at Hanna's" cannot be described. Word had been sent to Steubenville, and Colonel James Collier marched out with a force of about eight hundred militia, sending a squad under command of Captain Prentiss to reconnoiter. They galloped through the village, and as Morgan's advance came in sight began firing. The fire was returned, and a private named Parks, from Steubenville, was wounded. Morgan's men charged the scouting party, sending them through the village back to the main body in a very demoralized condition. The frightened women, and still worse frightened children, no sooner saw the "dust-brown ranks" of the head of Morgan's column than they beat a hasty retreat down the alley to the house of Dr. Markle, the village physician. This change of base

At Salineville he found Morgan, pursued by Major Way, pushing for Smith's Ford on the Ohio. Breaking into trot and gallop, he outmarched and intercepted the fugitives at the cross-roads near Beaver Creek, and had gained the enemy's front and flank when a flag of truce was raised, and Morgan coolly demanded his surrender. Rue's threat to open fire brought Morgan to terms, when another issue was raised. It was now claimed that Morgan had already surrendered, namely, to a militia officer, and been by him paroled. This "officer" turned out to be "Captain" James Burbick, of the home guard.² Rue held Morgan, with 364 officers and men and 400 horses, till General Shackelford came up, who held them as prisoners of war.

was made under fire, as Morgan's men were shooting at the retreating militia, and also at a house owned by William Fisher, in which they had heard there were a number of militiamen. At the doctor's house all crowded into one room, and were led in prayer by the minister's wife. The retreat of the scouting party did not have a very cheering effect upon the advancing militia. As they passed a field of broomcorn several men suddenly disappeared, their swift course through the cane being easily followed by the swaying of the tassels. The militia were met by rumors that the village was in ashes. Morgan did not set fire to the village, but his men found time to explore the village store and to search the Fisher house, in the second story of which they found a flag. Morgan's men were hardly out of sight on the Richmond road when Colonel Collier and the militia appeared. They formed line of battle on a hill east of the village just in time to see Shackelford's advance coming along the road over which they were expecting Morgan. The colonel at once opened fire with his six-pounder loaded with scrap iron. The first shot did little damage. One piece of scrap iron found its way to the right, and struck with a resounding thwack against the end of the Maxwell Tavern. The second shot did not hit anything. One of Shackelford's officers rode across the field and inquired, "What are you fools shooting at?" The colonel then learned, to his astonishment, that Morgan was at least two miles out on the Richmond road. Many who had been conspicuously absent then showed themselves, and the daring deeds and hairbreadth escapes which came to light are not to be lightly referred to. At least a dozen dead rebels, it was said, would be discovered in the fields when the farmers came to cut their oats, but for some reason the bodies were never found.

² General W. T. H. Brooks says in his report:

Morgan had passed a company of citizens from New Lisbon, and agreed not to fire upon them if they would not fire upon him. He had taken two or three of their men prisoners, and was using them as guides. Among them was a Mr. Burbick, of New Lisbon, who had gone out at the head of a small squad of mounted men. When Morgan saw that his advance was about to be cut off by Major Rue, he said to this Captain Burbick: "I would prefer to surrender to the militia rather than to United States troops. I will surrender to you if you will agree to respect private property and parole the officers and men as soon as we get to Cincinnati." Burbick replied that he knew nothing about this business. Morgan said, "Give me an answer, yes or no." Burbick, evidently in confusion, said, "Yes."

James Burbick sent a statement to Governor Tod, in which he said that he was not a prisoner with Morgan, but that he was guiding him voluntarily away from the vicinity of New Lisbon, after Morgan had agreed not to pass through that town. Burbick says that he accepted Morgan's surrender, and started for the rear with a handkerchief tied to a stick to intercept the advancing troops, while Lieutenant C. D. Maus, a prisoner with Morgan, was sent with another flag of truce across the fields.—EDITOR.

And thus ended the greatest of Morgan's raids. By it Bragg lost a fine large division of cavalry, that, if added to Buckner's force,—already equal to Burnside's in East Tennessee,—might have defeated Burnside; or, if thrown across Rosecrans's flanks or long lines of supply

and communication, or, used in reconnaissance on the Tennessee River, might have baffled Rosecrans's plans altogether. As it was, Rosecrans was able to deceive Bragg by counterfeited movements that could easily have been detected by Morgan.

Orlando B. Willcox.

III.—THE ESCAPE.¹

ON the 31st of July and the 1st of August, 1863, General John H. Morgan, General Basil W. Duke, and sixty-eight other officers of Morgan's command were, by order of General Burnside, confined in the Ohio State Penitentiary at Columbus. Before entering the main prison we were searched and relieved of our pocket-knives, money, and all other articles of value, subjected to a bath, the shaving of our faces, and the cutting of our hair. We were placed each in a separate cell in the first and second tiers on the south side in the east wing of the prison. General Morgan and General Duke were on the second range, General Morgan being confined in the last cell at the east end, those who escaped with General Morgan having their cells in the first range.

From five o'clock in the evening until seven o'clock in the morning we were locked into our cells, with no possible means of communication with one another; but in the day, between these hours, we were permitted to mingle together in the narrow hall, twelve feet wide and one hundred and sixty long, which was cut off from the other portion of the building, occupied by the convicts, by a plank partition, in one end of which was a wooden door. At each end of the hall and within the partitions was an armed military sentinel, while the civil guards of the prison passed at irregular intervals among us, and very frequently the warden or his deputy came through in order to see that we were secure and not violating the prison rules. We were not permitted to talk with or in any way to communicate with the convicts, nor were we permitted to see any of our relatives or friends that might come from a distance to see us, except upon the written order of General Burnside, and then only in the presence of a guard. Our correspondence underwent the censorship of the warden, we receiving and he sending only such as met his approbation. We were not permitted to have newspapers, or to receive information of what was going on in the outside busy world.

Many plans for escape, ingenious and desperate, were suggested, discussed, and rejected because deemed impracticable. Among them was bribery of the guards. This was thought not feasible because of the double set of guards, military and civil, who were jealous and watchful of each other, so that it was never attempted, although we could have commanded, through our friends in Kentucky and elsewhere, an almost unlimited amount of money.

On a morning in the last days of October I was rudely treated, without cause, by the deputy warden. There was no means of redress, and it was not wise to seek relief by retort, since I knew, from the experience of my comrades, that it would result in my confinement in a dark dungeon, with bread and water for diet. I retired to my cell and closed the door with the determination that I would neither eat nor sleep until I had devised some means of escape. I ate nothing and drank nothing during the day, and by nine o'clock at night I had matured the plan that we carried into execution. It may be that I owe something to the fact that I had just completed the reading of Victor Hugo's "*Les Misérables*," containing such vivid delineations of the wonderful escapes of Jean Valjean, and of the subterranean passages of the city of Paris. This may have led me to the line of thought that terminated in the plan of escape adopted. It was this: I had observed that the floor of my cell was upon a level with the ground upon the outside of the building, which was low and flat, and also that the floor of the cell was perfectly dry and free from mold. It occurred to me that, as the rear of the cell was to a great extent excluded from the light and air, this dryness and freedom from mold could not exist unless there was underneath something in the nature of an air-chamber to prevent the dampness from rising up the walls and through the floor. If this chamber should be found to exist, and could be reached, a tunnel might be run through the foundations into the yard, from which we might escape by scaling the outer wall, the air-chamber furnishing a

¹ Condensed from "The Bivouac" of June, 1885.—EDITOR.

receptacle for the earth and stone to be taken out in running the tunnel. The next morning when our cells were unlocked, and we were permitted to assemble in the hall, I went to General Morgan's cell, he having been for several days quite unwell, and laid before him the plan as I have sketched it. Its feasibility appeared to him unquestioned, and to it he gave a hearty and unqualified approval. If, then, our supposition was correct as to the existence of the air-chamber beneath the lower range of cells, a limited number of those occupying that range could escape, and only a limited number, because the greater the number the longer the time required to complete the work, and the greater the danger of discovery while prosecuting it, in making our way over the outer wall, and in escaping afterward.

With these considerations in view, General Morgan and myself agreed upon the following officers, whose cells were nearest the point at which the tunnel was to begin, to join us in the enterprise: Captain J. C. Bennett, Captain L. D. Hockersmith, Captain C. S. Magee, Captain Ralph Sheldon, and Captain Samuel B. Taylor. The plan was then laid before these gentlemen, and received their approval. It was agreed that work should begin in my cell, and continue from there until completed. In order, however, to do this without detection, it was necessary that some means should be found to prevent the daily inspection of that cell, it being the custom for the deputy warden, with the guards, to visit and have each cell swept every morning. This end was accomplished by my obtaining permission from the warden to furnish a broom and sweep my own cell. For a few mornings thereafter the deputy warden would pass, glance into my cell, compliment me on its neatness, and go on to the inspection of the other cells. After a few days my cell was allowed to go without any inspection whatever, and then we were ready to begin work, having obtained through some of our associates, who had been sent to the hospital, some table knives made of flat steel files. In my cell, as in the others, there was a narrow iron cot, which could be folded and propped up to the cell wall. I thought the work could be completed within a month.

On the 4th of November work was begun in the back part of my cell, under the rear end of my cot. We cut through six inches of cement, and took out six layers of brick put in and cemented with the ends up. Here we came to the air-chamber, as I had calculated, and found it six feet wide by four feet high, and running the entire length of the range of cells. The cement and brick taken out in effecting an entrance to the chamber were placed in my bed-

tick, upon which I slept during the progress of this portion of the work, after which the material was removed to the chamber. We found the chamber heavily grated at the end, against which a large quantity of coal had been heaped, cutting off any chance of exit in that way. We then began a tunnel, running it at right angles from the side of the chamber, and almost directly beneath my cell. We cut through the foundation wall, five feet thick, of the cell block; through twelve feet of grouting, to the outer wall of the east wing of the prison; through this wall, six feet in thickness; and four feet up near the surface of the yard, in an unfrequented place between this wing and the female department of the prison.

During the progress of the work, in which we were greatly assisted by several of our comrades who were not to go out, notably among them Captain Thomas W. Bullitt of Louisville, Kentucky, I sat at the entrance to my cell studiously engaged on Gibbon's *Rome* and in trying to master French. By this device I was enabled to be constantly on guard without being suspected, as I had pursued the same course during the whole period of my imprisonment. Those who did the work were relieved every hour. This was accomplished and the danger of the guards overhearing the work as they passed obviated by adopting a system of signals, which consisted in giving taps on the floor over the chamber. One knock was to suspend work, two to proceed, and three to come out. On one occasion, by oversight, we came near being discovered. The prisoners were taken out to their meals by ranges, and on this day those confined in the first range were called for dinner while Captain Hockersmith was in the tunnel. The deputy warden, on calling the roll, missed Hockersmith, and came back to inquire for him. General Morgan engaged the attention of the warden by asking his opinion as to the propriety of a remonstrance that the general had prepared to be sent to General Burnside. Flattered by the deference shown to his opinion by General Morgan, the warden unwittingly gave Captain Hockersmith time to get out and fall into line for dinner. While the tunnel was being run, Colonel R. C. Morgan, a brother of General Morgan, made a rope, in links, of bed-ticking, thirty-five feet in length, and from the iron poker of the hall stove we made a hook, in the nature of a grappling-iron, to attach to the end of the rope.

The work was now complete with the exception of making an entrance from each of the cells of those who were to go out. This could be done with safety only by working from the chamber upward, as the cells were daily inspected. The difficulty presented in doing this was the fact that we did not know at what

point to begin in order to open the holes in the cells at the proper place. To accomplish this a measurement was necessary, but we had nothing to measure with. Fortunately the deputy warden again ignorantly aided us. I got into a discussion with him as to the length of the hall, and to convince me of my error he sent for his measuring line, and after the hall had been measured and his statement verified General Morgan occupied his attention, while I took the line, measured the distance from center to center of the cells,—all being of uniform size,—and marked it upon the stick used in my cell for propping up my cot. With this stick, measuring from the middle of the hole in my cell, the proper distance was marked off in the chamber for the holes in the other cells. The chamber was quite dark, and light being necessary for the work we had obtained candles and matches through our sick comrades in the hospital. The hole in my cell during the progress of the work was kept covered with a large hand satchel containing my change of clothing. We cut from underneath upward until there was only a thin crust of the cement left in each of the cells. Money was necessary to pay expenses of transportation and for other contingencies as they might arise. General Morgan had some money that the search had not discovered, but it was not enough. Shortly after we began work I wrote to my sister in Kentucky a letter, which through a trusted convict I sent out and mailed, requesting her to go to my library and get certain books, and in the back of a designated one, which she was to open with a thin knife, place therein a certain amount of Federal money, repaste the back, write my name across the inside of the back where the money was concealed, and send the box by express. In due course of time the books with the money came to hand. It only remained now to get information as to the time of the running of the trains and to await a cloudy night, as it was then full moon. Our trusty convict was again found useful. He was quite an old man, called Heavy, had been in the penitentiary for many years, and as he had been so faithful, and his time having almost expired, he was permitted to go on errands for the officials to the city. I gave him ten dollars to bring us a daily paper and six ounces of French brandy. Neither he nor any one within the prison or on the outside had any intimation of our contemplated escape.

It was our first thought to make our way to the Confederacy by the way of Canada; but, on inspecting the time-table in the paper, it was seen that a knowledge of the escape would necessarily come to the prison officials before we could reach the Canadian border. There was nothing left, then, but to take the train

south, which we found, if on time, would reach Cincinnati, Ohio, before the cells were opened in the morning, at which time we expected our absence to be discovered. One thing more remained to be done, and that was to ascertain the easiest and safest place at which to scale the outside wall of the prison. The windows opening outward were so high that we could not see the wall. In the hall was a ladder resting against the wall, fifty feet long, that had been used for sweeping down the wall. A view from the top of the ladder would give us a correct idea of the outside, but the difficulty was to get that view without exciting suspicion.

Fortunately the warden came in while we were discussing the great strength and activity of Captain Samuel B. Taylor, who was very small of stature, when it was suggested that Taylor could go hand over hand on the under side of the ladder to the top, and, with a moment's rest, return in the same way. To the warden this seemed impossible, and, to convince him, Taylor was permitted to make the trial, which he did successfully. At the top of the ladder he rested for a minute and took a mental photograph of the wall. When the warden had left, Taylor communicated the fact that directly south of and at almost right angles from the east end of the block in which we were confined there was a double gate to the outer wall, the inside one being of wooden uprights four inches apart, and the outside one as solid as the wall; the wooden gate being supported by the wing wall of the female department, which joined to the main outer wall.

On the evening of the 27th of November the cloudy weather so anxiously waited for came; and prior to being locked in our cells it was agreed to make the attempt at escape that night. Cell No. 21, next to my cell, No. 20, on the first range, was occupied by Colonel R. C. Morgan, a brother of General Morgan. That cell had been prepared for General Morgan by opening a hole to the chamber, and when the hour for locking up came General Morgan stepped into Cell 21, and Colonel Morgan into General Morgan's cell in the second range. The guard did not discover the exchange, as General Morgan and Colonel Morgan were of about the same physical proportions, and each stood with his back to the cell door when it was being locked.

At intervals of two hours every night, beginning at eight, the guards came around to each cell and passed a light through the grating to see that all was well with the prisoners. The approach of the guard was often so stealthily made that a knowledge of his presence was first had by seeing him at the door of the cell. To avoid a surprise of this kind we sprinkled fine coal along in front of the cells, walking

upon which would give us warning. By a singular coincidence that might have been a fatality, on the day we had determined upon for the escape General Morgan received a letter from Lexington, Kentucky, begging and warning him not to attempt to escape, and by the same mail I received a letter from a member of my family saying that it was rumored and generally believed at home that I had escaped. Fortunately these letters did not put the officials on their guard. We ascertained from the paper we had procured that a train left for Cincinnati at 1.15 A. M., and as the regular time for the guard to make his round of the cells was twelve o'clock, we arranged to descend to the chamber immediately thereafter. Captain Taylor was to descend first, and, passing under each cell, notify the others. General Morgan had been permitted to keep his watch, and this he gave to Taylor that he might not mistake the time to go.

At the appointed hour Taylor gave the signal, each of us arranged his cot with the seat in his cell so as to represent a sleeping prisoner, and, easily breaking the thin layer of cement, descended to the chamber, passed through the tunnel, breaking through the thin stratum of earth at the end. We came out near the wall of the female prison,—it was raining slightly,—crawled by the side of the wall to the wooden gate, cast our grappling iron attached to the rope over the gate, made it fast, ascended the rope to the top of the gate, drew up the rope and made our way by the wing wall to the outside wall, where we entered a sentry-box and divested ourselves of our soiled outer garments. In the daytime sentinels were placed on this wall, but at night they were on the inside of the walls and at the main entrance to the prison. On the top of the wall we found a cord running along the outer edge and connecting with a bell in the office of the prison. This cord General Morgan cut with one of the knives we had used in tunneling. Before leaving my cell I wrote and left, addressed to N. Merion, the warden, the following:

CASTLE MERION, CELL No. 20, November 27, 1863.—Commencement, November 4, 1863; conclusion, November 24, 1863; number of hours for labor per day, five; tools, two small knives. *La patience est amère, mais son fruit est doux.* By order of my six honorable Confederates. THOMAS H. HINES, *Captain, C. S. A.*

Having removed all trace of soil from our clothes and persons, we attached the iron hook to the railing on the outer edge of the wall, and descended to the ground within sixty yards of where the prison guards were sitting round a fire and conversing. Here we separated, General Morgan and myself going to the depot,

about a quarter of a mile from the prison, where I purchased two tickets for Cincinnati, and entered the car that just then came in. General Morgan took a seat by the side of a Federal major in uniform, and I sat immediately in their rear. The general entered into conversation with the major, who was made the more talkative by a copious drink of my French brandy. As the train passed near the prison wall where we had descended the major remarked, "There is where the rebel General Morgan and his officers are put for safe keeping." The general replied, "I hope they will keep him as safe as he is now." Our train passed through Dayton, Ohio, and there, for some unknown reason, we were delayed an hour. This rendered it extra hazardous to go to the depot in the city of Cincinnati, since by that time the prison officials would, in all probability, know of our escape, and telegraph to intercept us. In fact, they did telegraph in every direction, and offered a reward for our recapture. Instead, then, of going to the depot in Cincinnati, we got off, while the train was moving slowly, in the outskirts of the city, near Ludlow Ferry, on the Ohio River. Going directly to the ferry we were crossed over in a skiff and landed immediately in front of the residence of Mrs. Ludlow. We rang the door-bell, a servant came, and General Morgan wrote upon a visiting-card, "General Morgan and Captain Hines, escaped." We were warmly received, took a cup of coffee with the family, were furnished a guide, and walked some three miles in the country, where we were furnished horses. Thence we went through Florence to Union, in Boone County, Kentucky, where we took supper with Daniel Piatt. On making ourselves known to Mr. Piatt, who had two sons in our command, we were treated with the most cordial hospitality and kindness by the entire family. We there met Dr. John J. Dulaney, then of Florence, Kentucky, who was of great benefit in giving us information as to the best route to pursue. That night we went to Mr. Corbin's, near Union,—who also had gallant sons in our command,—where we remained concealed until the next night, and where friends supplied us with good, fresh horses and a pair of pistols each.

On the evening of the 29th of November we left Union with a voluntary guide, passed through the eastern edge of Gallatin County, and after traveling all night spent the day of the 30th at the house of a friend on the Owen County line. Passing through New Liberty, in Owen County, and crossing the Kentucky River at the ferry on the road to New Castle, in Henry County, we stopped at the house of Mr. Pollard at 2 A. M., December 1. Our guide did not know the people nor the roads farther

than the ferry, at which point he turned back. Not knowing the politics of Mr. Pollard, it was necessary to proceed with caution. On reaching his house we aroused him and made known our desire to spend the remainder of the night with him. He admitted us and took us into the family room, where there was a lamp dimly burning on a center-table. On the light being turned up I discovered a Cincinnati "Enquirer" with large displayed head-lines, announcing the escape of General Morgan, Captain Hines, and five other officers from the Ohio penitentiary. The fact that this newspaper was taken by Mr. Pollard was to me sufficient evidence that he was a Southern sympathizer. Glancing at the paper, I looked up and remarked, "I see that General Morgan, Hines, and other

command in citizen's dress. That night we passed through Taylorsville, and stopped on the morning of the 3d near Bardstown.

The night of the 4th we resumed our journey, and stopped on the morning of the 5th at Mr. McCormack's at Rolling Fork Creek, in Nelson County, thence through

Taylor, Green (passing near Greensburg), Adair, and Cumberland counties, crossing Cumberland River some nine miles below Burkesville. We crossed the Cumberland, which was quite high, by swimming our horses

by the side of a canoe. Near the place of crossing, on the south side, we stopped overnight with a private in Colonel R. T. Jacob's Federal cavalry, passing ourselves as citizens on the lookout for stolen horses. Next morning, in approaching the road from Burkesville to Sparta, Tennessee, we came out of a byway immediately in the rear of and some hundred yards from a dwelling fronting on the Burkesville-Sparta road, and screening us from view on the Burkesville end. As we emerged from the woodland a woman appeared at the back door of the dwelling and motioned us back. We withdrew from view, but kept in sight of the door from which the signal to retire was given, when after a few minutes the woman again appeared and signaled us to come forward. She informed us that a body of Federal cavalry had just passed, going in the direction of Burkesville, and that

EXTERIOR OF THE PRISON. B—EXIT FROM TUNNEL.

officers have escaped from the penitentiary." He responded, "Yes; and you are Captain Hines, are you not?" I replied, "Yes; and what is your name?" "Pollard," he answered. "Allow me, then, to introduce General Morgan." I found that I had not made a mistake.

After rest and a late breakfast and a discussion of the situation, it was deemed inexpedient to remain during the day, as the house was immediately on a public highway, besides the danger of such unexplained delay exciting the suspicion of the negroes on the place. We assumed the character of cattle-buyers, Mr. Pollard furnishing us with cattle-whips to make the assumption plausible. Our first objective point was the residence of Judge W. S. Pryor, in the outskirts of New Castle. After dinner Judge Pryor rode with us some distance, and put us in charge of a guide, who conducted us that night to Major Helm's, near Shelbyville, where we remained during the day of the 2d, and were there joined by four of our

CORRIDOR AND CELLS IN THE EAST WING. A—CAPTAIN HINES'S CELL.

WITHIN THE WOODEN GATE.

OVER THE PRISON WALL.

the officer in command informed her that he was trying to intercept General Morgan. We followed the Burkesville road something like a mile, and in sight of the rear-guard. We crossed Obey's River near the mouth of Wolf, and halted for two days in the hills of Overton County, where we came upon forty of our men, who had been separated from the force on the expedition into Indiana and Ohio. These men were placed under my command, and thence we moved directly towards the Tennessee River, striking it about fifteen miles below Kingston, at Bridges's Ferry, December 13. There was no boat to be used in crossing, and the river was very high and angry, and about one hundred and fifty yards wide. We obtained an ax from a house near-by and proceeded to split logs and make a raft on which to cross, and by which to swim our horses. We had learned that two miles and a half below us was a Federal cavalry camp. This stimulated us to the utmost, but notwithstanding our greatest efforts we were three hours in crossing over five horses and twenty-

five men. At this juncture the enemy appeared opposite, and began to fire on our men.

Here General Morgan gave characteristic evidence of devotion to his men. When the firing began he insisted on staying with the dismounted men and taking their chances, and was only dissuaded by my earnest appeal and representation that such a course would endanger the men as well as ourselves. The men, by scattering in the mountains, did ultimately make their way to the Confederacy.

General Morgan, myself, and the four mounted men crossed over a spur of the mountains and descended by a bridle-path to a ravine or gulch upon the opposite side, and halted in some thick underbrush about ten steps from a path passing along the ravine. Not knowing the country, it was necessary to have information or a guide, and observing a log cabin about a hundred yards up the ravine, I rode there to get directions, leaving General Morgan and the others on their horses near the path. I found at the house a woman and some children. She could not direct me over

the other spur of the mountain, but consented that her ten-year-old son might go with me and show the way. He mounted behind me, and by the time he was seated I heard the clatter of hoofs down the ravine, and, looking, I saw a body of about seventy-five cavalry coming directly towards me, and passing within ten steps of where the general and his men were sitting on their horses. I saw that my own escape was doubtful, and that any halt or delay of the cavalry would certainly result in the discovery and capture of General Morgan. I lifted the boy from behind me and dashed to the head of the column, exclaiming, "Hurry up, Major, or the rebels will escape!" He responded, "Who are you?" I answered, "I belong to the home-guard company in the bend: hurry, or they are gone." We dashed on, I riding by the major at the head of the column about half a mile, when we came to where a dry branch crossed the road, and, as it had been raining that day, it was easily seen from the soil that had washed down from the side of the mountain that no one had passed there since the rain. Seeing this, the command was halted, and the major again demanded to know who I was. I replied that I was a member of General Morgan's command. "Yes,

— you! You have led me off from Morgan; I have a notion to hang you for it." "No, that was not General Morgan. I have served under him two years and know him well, and have no object in deceiving you, for if it was Morgan he is now safe." "You lie,

for he was recognized at the house where you got the ax. I would not have missed getting him for ten thousand dollars. It would have been a brigadier's commission to me. I will hang you for it." Up to this time I had taken the situation smilingly and pleasantly, because I did not apprehend violence; but the officer, livid with rage from disappointment, directed one of his men to take the halter from his horse and hang me to a designated limb of a tree. The halter was adjusted around my neck, and thrown over the limb. Seeing that the officer was desperately in earnest, I said, "Major, before you perform this operation, allow me to make a suggestion." "Be quick about it, then." "Suppose that *was* General Morgan, as you insist, and I have led you astray, as you insist, would n't I, being a member of his command, deserve to be hung if I had not done what you charge me with?" He dropped his head for a moment, looked up with a more pleasant expression, and said, "Boys, he is right; let him alone."

I was placed under guard of two soldiers and sent across the river to camp, while the officer in command took his men over the mountain in search of General Morgan, who succeeded in making good his escape. The next evening the major returned with his command from his unsuccessful pursuit. He questioned me closely, wanting to know my name, and if I was a private in the command, as I had stated to him at the time of my capture. Remembering that in prison the underclothing of

"HURRY UP, MAJOR!"

CAPTAIN HINES OBJECTS.

Captain Bullitt had been exchanged for mine, and that I then had on his with his name in ink, I assumed the name of Bullitt.

On the evening of the second day in this camp the major invited me to go with him and take supper at the house of a Unionist half a mile away. We spent the evening with the family until nine o'clock, when the major suggested that we should go back to camp. On reaching the front gate, twenty steps from the front veranda, he found that he had left his shawl in the house, and returned to get it, requesting me to await his return. A young lady of the family was standing in the door, and when he went in to get the shawl she closed the door. I was then perfectly free, but I could not get my consent to go. For a moment of time while thus at liberty I suffered intensely in the effort to determine what was the proper thing to do. Upon the one hand was the tempting offer of freedom, that was very sweet to me after so many months of close confinement, while on the other was the fact that the officer had treated me with great kindness, more as a comrade than as a prisoner, that the acceptance of his hospitality was a tacit parole and my escape would involve him in trouble. I remained until his return. He was greatly agitated, evidently realizing for the first time the extent of his indiscretion, and surprised undoubtedly at finding me quietly awaiting him. I had determined not to return to prison, but rather than break faith I awaited

some other occasion for escape. Notwithstanding all this, something excited suspicion of me, for the next morning, while lying in a tent apparently asleep, I heard the officer direct the sergeant to detail ten men and guard me to Kingston, and he said to the sergeant, "Put him on the meanest horse you have, and be watchful or he will escape." I was taken to Kingston and placed in jail, and there met three of our party who had been captured on the north side of the Tennessee River at the time we attempted to cross. They were R. C. Church, William Church, and ——— Smith. After two days' confinement there, we were sent under guard of twelve soldiers to the camp of the 3d Kentucky Federal Infantry, under command of Colonel Henry C. Dunlap. The camp was opposite the town of Loudon, and was prepared for winter quarters. The large forest trees had been felled for a quarter of a mile around the camp, and log huts built in regular lines for the occupation of the troops. We were placed in one of these huts with three guards on the inside, while the guards who delivered us there were located around a camp-fire some ten steps in front of the only door to our hut, and around the whole encampment was the regular camp guard. The next day, as we had learned, we were to be sent to Knoxville, Tennessee, which was then General Burnside's headquarters, and as I knew I would there be recognized, and, on account of my previous escape, that my chances for freedom

would be reduced to a minimum, we determined to escape that night.

It was perfectly clear, the moon about full, making the camp almost as light as day, and as the moon did not go down until a short time before daylight we concluded to await its setting. The door of the cabin was fastened by a latch on the inside. The night was cold. We had only pretended to sleep, awaiting our opportunity. When the moon was down we arose, one after another, from our couches, and went to the fire to warm us. We engaged the guards in pleasant conversation, detailing incidents of the war. I stood with my right next the door, facing the fire and the three guards, and my comrades standing immediately on my left. While narrating some incident in which the guards were absorbed, I placed my right hand upon the latch of the door, with a signal to the other prisoners, and, without breaking the thread of the narrative, bade the guards good night, threw the door open, ran through the guards in front of the door, passed the sentinel at the camp limits, and followed the road we had been brought in to the mountains. The guards in front of the door fired upon me, as did the sentinel on his beat, the last shot being so close to me that I felt the fire from the gun. Unfortunately and unwittingly I threw the door open with such force that it rebounded and caught my comrades on the inside. The guards assaulted them and attempted to bayonet them, but they grappled, overpowered, and disarmed the guards, and made terms with them before they would let them up. All three of these prisoners, by great daring, escaped before they were taken North to prison.

In running from the camp to the mountains I passed two sentinel fires, and was pursued some distance at the point of the bayonet of the soldier who had last fired at me. All was hurry and confusion in the camp. The horses were bridled, saddled, and mounted, and rapidly ridden out on the road I had taken, but by the time the pursuers reached the timber I was high up the mountain side, and complacently watched them as they hurried by. As I ran from my prison house I fixed my eye upon Venus, the morning star, as my guide, and traveled until daylight, when I reached the summit of a mountain, where I found a sedge-grass field, of about twenty acres, in the middle of which I lay down on the frozen ground and remained until the sun had gone down and darkness was gathering. During the day the soldiers in search of me frequently passed within thirty steps, so close that I could hear their conjectures as to where I was most likely to be found. I remained so long in one

position that I thawed into the frozen earth, but the cool of the evening coming on, the soil around me froze again, and I had some difficulty in releasing myself.

As it grew dark I descended the mountain, and cautiously approached a humble dwelling. Seeing no one but a woman and some children, I entered and asked for supper. While my supper was being prepared, no little to my disappointment the husband, a strapping, manly-looking fellow, with his rifle on his shoulder, walked in. I had already assumed a character, and that was as agent to purchase horses for the Federal Government. I had come down that evening on the train from Knoxville, and was anxious to get a canoe and some one to paddle me down to Kingston, where I had an engagement for the next day to meet some gentlemen who were to have horses there, by agreement with me, for sale. Could the gentleman tell me where I could get a canoe and some one to go with me? He said the rebels were so annoying that all boats and canoes had been destroyed to keep them from crossing. He knew of but one canoe, owned by a good Union man some two miles down the river. Would he be kind enough to show me the way there, that I might get an early start and keep my engagement?

After supper my hospitable entertainer walked with me to the residence of the owner of the canoe. The family had retired, and when the owner of the premises came out there came with him a Federal soldier who was staying overnight with him. This was not encouraging. After making my business known and offering large compensation, the owner of the canoe agreed to start with me by daylight. During my walk down there my guide had mentioned that a certain person living opposite the place where the canoe was owned had several horses that he would like to sell. I suggested that, in order to save time and get as early a start as possible for Kingston, the canoe owner should take me over to see to the purchase of these horses that night. The river was high and dangerous to cross at night, but by promises of compensation I was taken over and landed some quarter of a mile from the house. With an injunction to await me, when the canoe landed I started towards the house; but when out of sight I changed my course and took to the mountains.

For eight days I traveled by night, taking my course by the stars, lying up in the mountains by day, and getting food early in the evening wherever I could find a place where there were no men. On the 27th of December I reached the Confederate lines near Dalton, Georgia.

Thomas H. Hines.

COLONEL CARTER OF CARTERSVILLE.—III.

BY F. HOPKINSON SMITH.

AN ALLUSION TO A YELLOW DOG.

THE colonel's office, like many other of his valued possessions, was in fact the property of somebody else.

It really belonged to a friend of Fitzpatrick, who had become so impressed by the Virginian's largeness of manner and buoyant enthusiasm that he whispered

to Fitz to bring him in by all means and give him any desk in the place; adding that "in a sagging market the colonel would be better than a war boom."

So the colonel moved in — not a very complicated operation in his case; his effects being confined to an old leather portfolio and a bundle of quill pens tied up with a bit of Aunt Nancy's white yarn. The next day he nailed his visiting card above the firm's name in the corridor, hung his hat and coat on the proprietor's peg, selected a desk nearest the light, and was as much at home in five minutes as if he owned the whole building.

There was no price agreed upon, and the colonel never referred to it afterwards. Once, when Fitz delicately suggested that all such rents were generally payable monthly, the colonel, after some difficulty in grasping the idea, said:

"I could not offer it, suh. These gentlemen have treated me with a hospitality so generous that its memory will never fade from my mind. I cannot bring our relations down to the level of bargain and sale, suh; it would be vulgar."

The colonel believed it. As for himself he would have put every room in his own Carter Hall at their service for any purpose or for any length of time, and have slept in the woodshed himself; and he would as soon have demanded the value of the bottle of wine on his own table as ask pay for so trivial a courtesy.

Nor did he stop at the rent. The free use of stamps, envelops, paper, messenger service, and clerks were to him only evidences of a lordly sort of hospitality which endeared the real proprietor of the office all the more, because

it recalled the lavish display of the golden days of Carter Hall.

"Permit a guest to stamp his own letters, suh? Never! Our servants attended to that."

Really he owed them nothing. No office of its size in the Street made so much money for its customers in a bull market. Nobody lost heart in a tumble and was sold out — that is, nobody to whom the colonel talked. Once convince the enthusiastic Virginian that the scheme was feasible, — and how little eloquence was needed for that! — and the dear old fellow took hold with as much gusto as if it had been his own.

The vein in the copper mine was always going to widen out into a six-foot lead; never by any possibility could it grow any smaller. The trust shares were going up — "not a point or two at a time, gentlemen, but with the spring of a panther, suh." Of course the railroad earnings were a little off this month, but wait until the spring opened; "then, suh, you will see a revival that will sweep you off yo' feet."

Whether it was good luck, or the good heart that the colonel put into his friend's customers, the results were always the same. Singular as it may seem, his cheery word just at the right time tided over the critical moment many an uncertain watcher at the "ticker," often to the enlargement of their bank accounts. Nor would he allow any one to pay him for any service of this kind, even though he had spent days engrossed in their affairs.

"Take money, suh, for helpin' a friend out of a hole? My dear suh, I see you do not intend to be discourteous; but look at me, suh! There 's my hand: never refer to it again." And he would offer the offender his card in the hope that its ample record might furnish some further slight suggestion as to who he really was.

His popularity, therefore, was not to be wondered at. Everybody regarded him kindly, total stranger as he was, and although few of them believed to any extent in his "Garden Spot of Virginia" scheme, as his pet enterprise soon came to be known around the Street, there was no one who did not wish it well, and not a few would have started it with a considerable subscription could the colonel have managed the additional thousands required to set it on its financial legs.

But Fitz never lost heart in the scheme — that is, never when the colonel was about. As the weeks rolled by and one combination after the other failed, and the well-thumbed bundle of papers in the big blue envelop was returned with the various comments of "In view of our present financial engagements we are unable to undertake your very attractive railroad scheme," or the more curt "Not suited to our line of customers," he would watch the colonel's face anxiously and rack his brain for some additional excuse.

He always found one. Tight money, or news from Europe, or an overissue of similar bonds; next week it would be better. And the colonel always believed him. Fitz was his guiding star, and would lead him to some

"THE ADVANCE AGENT."

safe haven yet. This faith was his stronghold, and his only one.

This morning, however, there was a touch of genuine enthusiasm about Fitz. He rushed into the office, caught up the blue bundle and the map, nearly upsetting the colonel, who was balanced back in his chair with his long legs sprawled over the desk,—a favorite attitude when down town,—rushed out, and returned in half an hour with a fat body surmounted by a bald head fringed around with gray curls.

He was the advance agent of that mysterious combination known as an English syndicate, an elusive sort of commercial sea serpent with its head in London and its tail all over the globe. The "inquiry" which had so gladdened the colonel's heart the morning of the breakfast with Aunt Nancy had proceeded from this rotund negotiator.

The colonel had, as usual, started the road at Cartersville, and had gotten as far as the double-span iron bridge over the Tench when the rotund gentleman asked abruptly:

"How far are you from a coal-field?"

The colonel lifted the point of his pen, adjusted his glasses, and punched a hole in the crumpled map within a hair's breadth of a black dot labeled "Cartersville."

"Right there, suh. Within a stone's throw of our locomotives."

Fitz looked into the hole with as much astonishment as if it were the open mouth of the mine itself.

"Hard or soft?" said the stout man.

"Soft, suh, and fairly good coal, I understand, although I have never used it, suh; my ancestors always burned wood."

Fitz heard the statement in undisguised wonder. In all his intercourse with the colonel he had never known him before to depart so much as a razor's edge from the truth.

The fat man communed with himself a moment, and then said suddenly, "I'll take the papers and give you an answer in a week," and hurried away.

"Do you really mean, Colonel," said Fitz, determined to pin him down, "that there is a single pound of coal in Cartersville?"

"Do I mean it, Fitz? Don't it crop out in half a dozen spots right on our own place? One haalf of my estate, suh, is a coal-field."

"You never told me a word about it."

"I don't know that I did, Fitz. But it is of no use to me. Besides, suh, we have plenty of wood. We never burn coal at Caarter Hall."

Fitz did not take that view of it. He went into an exhaustive cross-examination of the colonel on the coal question—who had tested it, the character of the soil, width of the vein, and dip of the land. This information he carefully recorded in a small book which he took from his inside pocket.

Loosened from Fitz's pinioning grasp, the colonel, entirely oblivious to his friend's sudden interest in the coal-field, and slightly impatient at the delay, bounded like a balloon with its anchors cut.

"An answer from the syndicate within a week! My dear Fitz, I see yo' drift. You have kept the Garden Spot for the foreign investors. That man is impressed, suh; I saw it in his eye."

The room began filling up with the various customers and loungers common to such offices—the debonair gentleman in check trousers and silk hat, with a rose in his button-hole, who dusts his trousers broadside with his cane—short of one hundred shares with twenty per cent. margin; the shabby old man with a solemn face who watches the ticker a moment and then wanders aimlessly out, looking more like an underpaid clerk in a law office than the president of a crosstown railroad—long of one thousand shares with no

"THE NERVOUS MAN WHO STOPS THE MESSENGER BOYS."

margin at all; the nervous man who stops the messenger boys and devours the sales' lists before they can be skewered on the files — with not a dollar's interest either way; and, last of all, the brokers with little pads and nimble pencils in their hands.

The news that the great English syndicate was looking into the C. & W. A. L. R. R. was soon around the office, and each habitué had a bright word for the colonel in consequence, congratulating him on the favorable turn his affairs had taken.

All but old Klutchem, a broker in unlisted securities, who had been trying for weeks to get a Denver land scheme before the same syndicate, and had failed.

"Garden Spot bonds! Bosh! Road begins nowhere and ends nowhere. If any set of fools built it, the only freight it would get outside of peanuts and sweet potatoes would be niggers and razor-back hogs. I would n't give a yellow dog for enough of those securities to paper a church."

The colonel was on his feet in an instant.

"Mr. Klutchem, I cannot permit you, suh, to use such language in my presence unrebuked, you—"

"Now, see here, old Garden Spot, you know—"

The familiarity angered the colonel even more than the outburst.

"Caarter, suh—George Fairfax Caarter," said the colonel with dignity.

"Well, Caarter, then," mimicking him, perhaps unconsciously. "You know—"

The intonation was the last straw. The colonel lost all control over himself. No man had ever thus dared before.

"Stop, Mr. Klutchem! What I know, suh, I decline to discuss with you. Yo' statements are false, and yo' manner of expressin' them

quite in keepin' with the evident vulga'ity of yo' mind. If I can ascertain that you have ever had any claim to be considered a gentleman you will hear from me ag'in. If not, I shall rate you as rankin' with yo' yellow dog; and if you ever speak to me ag'in I will strike you, suh, with my cane."

And the colonel, with eyes flashing, strode into the private office with the air of a field marshal, and shut the door.

Klutchem looked around the room and into the startled faces of the clerks and bystanders, burst into a loud laugh, and left the office. On reaching the street he met Fitz coming in.

"Better look after old Garden Spot, Fitzpatrick. I poked holes in his road, and he wanted to swallow me alive."

CERTAIN IMPORTANT LETTERS.

WHEN I reached my lodgings that night I found this note, marked in the left-hand corner "Important," and in the right-hand corner "In haste." A boy had left it half an hour before.

Be at my house at six, prepared to leave town at an hour's notice.

CARTER.

I hurried to Bedford Place, dived through the tunnel, and found Fitzpatrick with his hand on the knocker. I followed him through the narrow hall and into the dining-room. He had

"LIKE AN EBONY STATUE OF LIBERTY." (SEE PAGE 431.)

a duplicate, also marked "Important" and "In haste," with this additional postscript: "Bring address of a prudent doctor."

"What does all this mean, Fitz?" I asked, spreading my letter out.

"I give it up, Major. The last I saw of the colonel was at two o'clock. He was then in the private office writing. That old wind-bag Klutchem had been worrying him, I heard, and the colonel sat down on him hard. But he had forgotten all about it when I saw him, for he was as calm as a clock. But what the devil, Major, does he want with a doctor? Chad!"

"Yes, sah!"

"Was the colonel sick this morning?"

"No, sah. Eat two b'iled eggs, and a dish ob ham half as big as yo' han'. He wa'n't sick, 'cause I yerd him singin' to hisself all frough de tunnel cl'ar out to de street."

We sat down and looked at each other. Could anybody else be sick? Perhaps Aunt Nancy had been taken ill on her way home to Virginia, and the doctor was for the dear lady. But why a "prudent doctor," and why both of us to go?

Fitz paced up and down the room, and I sat by the open window and looked out into the dreary yard. The hands of the clock in the tall tower outlined against the evening sky were past the hour, long past, and yet no colonel.

Suppose he had been suddenly stricken down himself! Suppose—

The slamming of the outer gate, followed by a sentry-like tread in the tunnel, cut short our quandary, and the colonel's tall figure emerged from the archway and mounted the steps.

"What has happened?" we both blurted out, opening the door for him. "Who's sick? Where are we going?"

The colonel's only reply was a pressure of our hands. Then placing his hat with great deliberation on the hall table, he drew off his gloves, waved us before him, and took his seat at the dining-room table.

Fitz and I, now thoroughly alarmed, and quite prepared for the worst, stood on each side.

The colonel dropped his hand into his inside pocket and drew forth three letters.

"Gentlemen, you see befo' you a man on the verge of one of the great crises of his life. You heard, Fitz, of what occurred in my office this mornin'? You know how brutally I was assaulted, and how entirely without provocation on my part? I am a Caarter, suh, and a gentleman. No man can throw discredit on an enterprise bearin' my name without bein' answerable to me." And the

colonel opened one of the letters and read as follows:

51 BEDFORD PLACE.
Tuesday.

P. A. KLUTCHEM.

Sir: You took occasion this morning, in the presence of a number of my friends, to make use of certain offensive remarks reflecting upon a great commercial enterprise to which I have lent my name. This was accompanied by a familiarity as coarse as it was unwarranted. The laws of hospitality, which your own lack of good breeding violated, forbade my having you ejected from my office on the spot.

I now demand that satisfaction to which I am entitled, and I herewith inform you that I am ready at an hour's notice to meet you at any point outside the city most convenient to yourself.

Immediately upon your reply my friend Mr. T. B. Fitzpatrick will wait upon you and arrange the details. I name Major Thos. C. Yancey of Virginia as my second in the field.

I have the honor to remain

Your obedient servant,

GEORGE FAIRFAX CARTER,
Late Colonel C. S. A.

"Suffering Moses!" cried out Fitz. "You are not going to send that?"

"It is sent, my dear Fitz. Mailed from my office this afternoon. This is a copy."

Fitz sank into a chair with both hands to his head.

"My object in sendin' for you both," the colonel continued, "was to be fully prepared should my antagonist select some early hour in the mornin'. In that case, Fitz, I shall have to rely on you alone, as Major Yancey cannot reach here until the followin' day. That was why a prudent doctor might be necessary at once."

Fitz's only reply was to thump his own head, as if the situation was too overpowering for words.

The colonel, with the same deliberation, opened the second letter. It was addressed to Judge Kerfoot, informing him of the nature of the "crisis," and notifying him of his (the colonel's) intention to appoint him sole executor of his estate should fate provide that vacancy.

The third was a telegram to Major Yancey summoning him at once "to duty on the field in an affair of honor."

"I am aware, Fitz, that some secrecy must be preserved in an affair of this kind Nawth—quite diffe'ent from our own county, and—"

"Secrecy! Secrecy! With that bellowing Klutchem? Don't you know that that idiot will have it all over the Street by nine o'clock to-morrow unless he is ass enough to get scared, get out a warrant, and clap you into the Tombs before breakfast? O Colonel! How could you do a thing like this without letting us know?"

The colonel never changed a muscle in his face. He was courteous, even patient with Fitz, now really alarmed over the consequences of what he considered a most stupendous piece of folly. He could not, he said, sit in judgment on other gentlemen. If Fitz felt that way, it was doubtless due to his education. As for himself, he must follow the traditions of his ancestors.

"But at all events, my friends, my dear friends,"—and he extended both hands,—“we must not let this affair spoil our ap'tites. Nothin' can now occur until the mornin', and we have ample time befo' daylight to make our preparations. Major, kindly touch the bell. Thank you! Chad, serve the soup.”

So short a time elapsed between the sound of the bell and the thrusting in of Chad's head that it was quite evident the darky had been listening on the outside.

If, however, that worthy guardian of the honor and dignity of the Carter family was at all disturbed by what he had heard, there was nothing in his face to indicate it. On the contrary, every wrinkle was twisted into curls and curves of hilarity. He even went so far during dinner as to correct his master in so slight a detail as to where Captain Loynes was hit in the famous duel between the colonel's father and that distinguished Virginian.

"Are you shore, Chad, it was in the leg?"

"Yes, sah, vehy sho. You don't reckel member, Colonel; but I had Marsa John's coat, an' I wrop it round Cap'in Loynes when he was caahied to his caahiage. Yes, sah, just above de knee. Marsa John picked him de fust shot."

"I remember now. Yes, you are right. The captain always walked a little lame."

"But, gentlemen,"—still with great dignity, but yet with an air as if he desired to relieve our minds from any anxiety so far as he was concerned,—“by far the most interesting affair of honor of my time was the one in which I met Major Howard, a prominent member of the Fairfax County bar. Some words in the heat of debate led to a blow, and the next mornin' the handkerchief was dropped at the edge of a wood near the cote-house just as the sun rose over the hill. As I fired, the light blinded me, and my ball passed through his left arm. I escaped with a hole in my sleeve.”

"Living yet?" said Fitz.

"Certainly, Suh, and one of the fo'most lawyers of our State. Vehy good friend of mine. Saw him on'y the week befo' I left home."

When dinner was served I could detect no falling off in the colonel's appetite. With the exception of a certain nervous expectance, intensified when there was a rap at the front

door, followed by a certain consequent disappointment when Chad announced the return of a pair of shoes—out to be half-soled—instead of the long-delayed reply from the offending broker, he was as calm and collected as ever.

It was only when he took from his table drawer some sheets of foolscap, spread the nib of a quill pen on his thumb nail, and beckoned Fitz to his side, that I noticed any difference even in his voice.

"You know, Fitz, that my hand is not so steady as it was, and if I should fall there are some things that must be attended to. Sit here and write these memoranda at my dictation."

Fitz drew nearer and bent his ear in attention.

"I, George Fairfax Caarter of Caarter Hall, Caartersville, Virginia, bein' of sound mind—"

The pen scratched away.

"Everything down but the sound mind," said Fitz; "but go on."

"Do hereby," continued the colonel.

"What 's all this for—another challenge?" said Fitz, looking up.

"No, Fitz,"—the colonel did not like his tone,—“but a few partin' instructions which will answer in place of a more formally drawn will.”

Fitz scratched on until the preamble was finished and the unencumbered half of Carter Hall had been bequeathed to “my ever valued aunt Ann Carter, spinster,” and he had reached a new paragraph beginning with, “All bonds, stocks, and shares, whether founders', preferred, or common, of the corporation known as the Cartersville and Warrentown Air Line Railroad, particularly the sum of 25,000 shares of said company subscribed for by the undersigned, I hereby bequeath,” when Fitz stopped and laid down his pen.

"You can't leave that stock. Not issued yet."

"I know it, Fitz; but I have pledged my word to take it, and so far as I am concerned it is mine."

Fitz looked over his glasses at me and completed the sentence by which this also became “the exclusive property of Ann Carter, spinster.” Then followed a clause giving his clothes to Chad, his seal and chain to Fitz, and his fowling piece to me. When the document was finished the colonel signed it in a bold, round hand, and attested it by a burning puddle of red wax into which he plunged the old family seal. Fitz and I duly witnessed it, and then the colonel, with the air of a man whose mind had been suddenly relieved of some great pressure, locked the important document in his drawer and handed the key to Fitz.

The change now in the colonel's manner was quite in keeping with the expression of his face. All his severe dignity, all the excess of responsibility and apparent studied calmness, were gone. He even became buoyant enough to light a pipe.

Presently he gave a little start as if suddenly remembering something until that moment overlooked, then he lighted a candle, and mounted the stairs to his bedroom. In a few minutes he returned, carrying in both hands a mysterious-looking box. This he placed with great care on the table, and proceeded to unlock with a miniature key attached to a bunch which he invariably carried in his trousers pocket.

It was a square box made of mahogany, bound at each corner with brass, and bearing in the center of the top a lozenge-shaped silver tablet engraved with the Carter coat of arms, the letters "G. F. C." being beneath.

The colonel raised the lid and uncovered the weapons that had defended the honor of the Carter family for two generations. They were the old-fashioned single-barrel kind, with butts like those of the pirates in a play, and they lay in a bed of faded red velvet surrounded by ramrods, bullet-molds, a green pill-box labeled "G. D. Gun Caps," some scraps of wash leather, together with a copper powder-flask and a spoonful of bullets. The nipples were protected by little patches cut from an old kid glove.

The colonel showed with great pride a dent on one side of the barrel where a ball had glanced, saving some ancestor's life; then he rang the bell for Chad, and consigned the case to that hilarious darky very much as the knight of a castle would place his trusty blade in the hands of his chief armorer.

"Want a tech o' ile in dese baals, Colonel," said Chad, examining them critically. "Got to keep dere moufs clean if you want dese dogs to bark right"; and he bore away the battery, followed by the colonel, who went down into the kitchen to see if the fire was hot enough to cast a few extra bullets.

Fitz and I, being more concerned about devising some method to prevent the consequences of the colonel's rash act than in in-

creasing the facilities for bloodshed, remained where we were and discussed the possible outcome of the situation.

We had about agreed that should Klutchem demand protection of the police, and the colonel be hauled up for violating the law of the State, I should go bail and Fitz employ the lawyer, when we were startled by a sound like the snap of a percussion-cap, followed by loud talking in the front yard.

First came a voice in a commanding tone: "Stand where you are! Drop yo' hand!"

Then Chad's "Don't shoot yit, Colonel."

Fitz and I started for the front door on a run, threw it open, and ran against Chad standing on the top step with his back to the door. Over his head he held the stub of a candle flickering in the night wind. This he moved up and down in obedience to certain mysterious sounds which came rumbling out of the tunnel. Beside him on the stone step lay the brass-cornered mahogany dueling case with both weapons gone.

The only other light visible was the glowing eye of the tall tower.

"Where 's the colonel?" we both asked in a breath.

Chad kept the light aloft with one hand like an ebony Statue of Liberty, and pointed straight ahead into the tunnel with the other.

"Mo' to the left," came the voice.

Chad swayed the candle towards the broken-down fence, and sent his magnified shadow scurrying up the measly wall and half way over to the next house.

"So! Now steady."

The darky stood like the Sphinx, the light streaming atop of the tall candlestick, and then he said from out one side of his mouth, "Spec' you gemmen better squat; she 's gwine to bite."

Fitz peered into the tunnel, caught the gleam of a pistol held in a shadowy hand, made a clear leap and landed out of range among the broken flower-pots. I sprang behind the hydrant, and at the same instant another cap snapped.

"Ah, gentlemen," said the voice emerging from the tunnel. "Had I been quite sure of myself I should have sent for you. I used to snuff a candle at fo'ty yards, and but that my powder is a little old I could do it ag'in."

(To be continued.)

FIREFLIES.

AS o'er the face of Evening fair
A shade of twilight came,
Lost sunbeams, tangled in her hair,
Fell into drops of flame.

Charles Henry Lüders.

SISTER DOLOROSA.

BY JAMES LANE ALLEN,

Author of "The White Cowl," "Two Gentlemen of Kentucky," etc.

IV.

ISTER DOLOROSA was returning from her visit to old Martha on the following afternoon. When she awoke that morning she resolutely put away all thought of what had happened the evening before. She prayed oftener than usual that day. She went about all duties with unwonted fervor. When she set out in the afternoon, and reached the spot in the fields where the meeting had taken place, it was inevitable that a nature sensitive and secluded like hers should be visited by some question touching who he was and whither he had gone; for it did not even occur to her that he would ever cross her path again. Soon she reached old Martha's; and then—a crippled toad with a subtle tongue had squatted for an hour at the ear of Eve, and Eve, beguiled, had listened. And now she was again returning across the fields homeward. Homeward?

Early that afternoon Helm had walked across the country to the station, some two miles off, to change his dress, with the view of going to the convent the next day. As he came back he followed the course which he had taken the day before, and this brought him into the same footpath across the fields.

Thus they met the second time. When she saw him, had she been a bird, with one sudden bound she would have beaten the air down beneath her frightened wings and darted high over his head straight to the convent. But his step grew slower and his look expectant. When they were a few yards apart he stepped out of the path into the low, gray weeds of the field, and seemed ready to pause; but she had instinctively drawn her veil close, and was passing on. Then he spoke quickly.

"I beg your pardon, but are strangers allowed to visit the convent?"

There was no mistaking the courtesy of the tone. But she did not lift her face towards him. She merely paused, though seeming to shrink away. He saw the fingers of one hand lace themselves around the cross. Then a moment later, in a voice very low and gentle, she replied, "The Mother Superior is glad to receive visitors at the convent," and, bowing, moved away.

He stood watching her with a quick flush of disappointment. Her voice, even more than her garb, had at once waved off all human approach. In his mind he had crossed the distance from himself to her so often that he had forgotten the actual abyss of sacred separation. Very thoughtfully he turned at last and took his way along the footpath—so thoughtfully, that he walked more slowly in his direction than she in hers.

As he was leaving the farmhouse the next day to go to the convent Ezra joined him, merely saying that he was going also. The old man had few thoughts; but with that shrewd secretiveness which is sometimes found in the dull mind he kept his counsels to himself. Their walk was finished in silence, and soon the convent stood before them.

Through a clear sky the wan light fell upon it as lifeless as though sent from a dead sun. The air hung motionless. The birds were gone. Not a sound fell upon the strained ear. Not a living thing relieved the eye. And yet within what tragedies and conflicts, what wounds and thorns of womanhood! Here, then, she lived and struggled and soared. An unearthly quietude came over him as he walked up the long avenue of elms, painfully jarred on by the noise of Ezra's shuffling feet among the dry leaves. Joyous life, as dear to him, had retired to infinite remoteness; and over him, like a preternatural chill in the faint sunlight, crept the horror of this death in life. Strangely enough he felt at one and the same time a repugnance to his own nature of flesh and a triumphant delight in the possession of bodily health, liberty,—the liberty of the world,—and a mind unfettered by tradition.

A few feet from the entrance an aged nun stepped from behind a hedgerow of shrubbery and confronted them.

"Will you state your business?" she said coldly, glancing at Helm and fixing her eyes on Ezra, who for reply merely nodded to Helm.

"I am a stranger in this part of the country, and heard that I would be allowed to visit the convent."

"Are you a Catholic?"

"No; I am a Protestant."

"Are you acquainted with any of the young ladies in the convent?"

"I am not."

She looked him through and through. He met her scrutiny with frank unconsciousness. "Will you come in? I will take your name to the Mother Superior."

They followed her into a small reception room, and sat for a long time waiting. Then an inner door opened, and another aged nun, sweet-faced and gentle, entered and greeted them pleasantly, recognizing Ezra as an acquaintance.

"Another Sister will be sent to accompany us," she said, and sat down to wait, talking naturally the while to the old man. Then the door opened again, and the heart of Helm beat violently: there was no mistaking the form, the grace. She crossed to the Sister, and spoke in an undertone.

"Sister Generose is engaged. Mother sent me in her place, Sister." Then she greeted Ezra and bowed to Helm, lifting to him an instant, but without recognition, her tremulous eyes. Her face had the whiteness of alabaster.

"We will go to the church first," said the Sister, addressing Helm, who placed himself beside her, the others following.

When they entered the church he moved slowly around the walls, trying to listen to his guide and to fix his thoughts upon the pictures and the architecture. Soon he became aware that Ezra had joined them, and as soon as pretext offered he looked back. In a pew near the door through which they had entered he could just see the kneeling form and bowed head of Sister Dolorosa. There she remained while they made the circuit of the building, and not until they were quitting it did she rise and again place herself by the side of Ezra. Was it her last prayer before her temptation?

They walked across the grounds towards the old-fashioned flower garden of the convent. The Sister opened the little latticed gate, and the others passed in. The temptation was to begin in the very spot where Love had long been wandering amid dumb companions.

"Ezra!" called the aged Sister, pausing just inside the gate and looking down at some recently dug bulbs, "has Martha taken up her tender bulbs? The frost will soon be falling." The old man sometimes helped at the convent in garden work.

"Who is this young man?" she inquired carelessly a few moments later.

But Ezra was one of those persons who cherish a faint dislike of all present company. Moreover, he knew the good Sister's love of news. So he began to resist her with the more pleasure that he could at least struggle to evade her questions.

"I don't know," he replied, with a mysterious shake of the head.

"Come this way," she said beguilingly, turning aside into another walk, "and look at the chrysanthemums. How did you happen to meet him?"

WHEN Sister Dolorosa and Helm found themselves walking slowly side by side down the garden path — this being what he most had hoped for and she most had feared — there fell upon each a momentary silence of preparation. Speak she must; if only in speaking she might not err. Speak he could; if only in speaking he might draw from her more knowledge of her life, and in some becoming way cause her to perceive his interest.

Then she, as his guide, keeping her face turned towards the border of flowers, but sometimes lifting it shyly to his, began with great sweetness and a little hurriedly, as if fearing to pause:

"The garden is not pretty now. It is full of flowers, but only a few are blooming. These are daffodils. They bloomed in March, long ago. And here were spring beauties. They grow wild, and do not last long. The Mother Superior wished some cultivated in the garden, but they are better if let alone to grow wild. And here are violets, which come in April. And here is Adam and Eve, and tulips. They are gay flowers, and bloom together for company. You can see Adam and Eve a long way off, and they look better at a distance. These were the white lilies, but one of the Sisters died, and we made a cross. That was in June. Jump-up-Johnnies were planted in this bed, but they did not do well. It has been a bad year. A storm blew the hollyhocks down, and there were cankerworms in the roses. That is the way with the flowers: they fail one year, and they succeed the next. They would never fail if they were let alone. It is pleasant to see them all starting out in the spring to be perfect each in its own way. It is pleasant to water them and to help. But some will be perfect, and some will be imperfect, and no one can alter that. They are like the children in the school; only the flowers would all be perfect if they had their way, and the children would all be wrong if they had theirs — the poor, good children! This is touch-me-not. Perhaps you have never heard of any such flower. And there, next to it, is love-lies-bleeding. We have not much of that; only this one little plant." And she bent over and stroked it.

His whole heart melted under the white radiance of her innocence. He had thought her older; now his feeling took the form of the purest delight in some exquisite child nature. And, therefore, feeling thus towards her, and seeing the poor, dead garden with only com-

mon flowers, which nevertheless she separately loved oblivious of their commonness, he said with sudden warmth, holding her eyes with his:

"I wish you could see my mother's garden and the flowers that bloom in it." And as he spoke there came to him a vision of her as she might look in a certain secluded corner of it, where ran a trellised walk; overclambering roses pale-golden, full-blown or budding, and bent with dew; the May sun all golden in the heavens; far and near birds singing and soaring in ecstasy; the air lulling the sense with perfume, quickening the blood with freshness; and there, within that frame of roses, her head bare and shining, her funereal garb forever laid aside for one that matched the loveliest hue of living nature around, a flower at her throat, flowers in her hand, sadness gone from her face, there the pure and radiant incarnation of a too-happy world, this exquisite child-nature, advancing towards him with eyes of love.

Having formed this picture, he could not afterward destroy it; and as they resumed their walk he began very simply to describe his mother's garden, she listening closely because of her love for flowers, which had become companions to her, and merely saying dreamily, half to herself and with guarded courtesy half to him, "It must be beautiful."

"THE Mother Superior intends to make the garden larger next year, and to have fine flowers in it, Ezra. It has been a prosperous year in the school, and there will be money to spare. This row of lilacs is to be dug up, and the fence set back so as to take in the onion patch over there. When does he expect to go away?" The aged Sister had not made rapid progress.

"I have not heard him say," replied the old man.

"Perhaps Martha has heard him say."

Ezra only struck the toe of his stout boot with his staff.

"The Mother Superior will want *you* to dig up the lilacs, Ezra. You can do it better than any one else."

The old man shook his head threateningly at the bushes. "I can settle them," he said.

"Better than any one else. Has Martha heard him say when he is going away?"

"To-morrow," he replied, conceding something in return for the lilacs.

"THESE are the chrysanthemums. They are white, but some are perfect and some are imperfect, you see. Those that are perfect are the ones to feel proud of, but the others are the ones to love."

"If all were perfect, would you no longer love them?" he said gently, thinking how perfect she was and how easy it would be to love her.

"If all were perfect, I could love all alike, because none would need to be loved more than others."

"And when the flowers in the garden are dead, what do you find to love then?" he asked, laughing a little and trying to follow her mood.

"It would not be fair to forget them because they are dead. But they are not dead; they go away for a season, and it would not be fair to forget them because they have gone away." All this she said simply and seriously as though her conscience were dealing with human virtues and duties.

"And are you satisfied to love things that are not present?" he asked, looking at her with sudden earnestness.

"THE Mother Superior will wish him to take away a favorable impression of the convent," said the Sister. "Young ladies are sometimes sent to us from that region." And now, having gotten from Ezra the information she desired and turned their steps towards the others, she looked at Helm with greater interest.

"Should you like to go upon the observatory?" she meekly asked, pointing to the top of the adjacent building. "From there you can see how far the convent lands extend. Besides, it is the only point that commands a view of the whole country."

The scene of the temptation was to be transferred to the pinnacle of the temple.

"Is it not asking too much of you to climb so far for my pleasure?"

"It is our mission to climb," she replied wearily; "and if our strength fails, we rest by the way."

Of herself she spoke literally; for when they came to the topmost story of the building, from which the observatory was reached by a short flight of steps, she sank into a seat placed near on purpose.

"Will you go above, Sister?" she said feebly. "I will wait here."

All the way up, also, the old man had been shaking his head with a stupid look of alarm and muttering his disapproval.

"There is a high railing, Ezra," she now said to him. "You could not fall." But he refused to go farther; he suffered from vertigo.

The young pair went up alone.

For miles in all directions the landscape lay shimmering in the autumnal sunlight—a poor, rough, homely land, with a few farmhouses of the plainest kind. Briefly she traced for him the boundary of the convent domain. And

then he, thinking proudly of his own region, now lying heavy in varied autumnal ripeness and teeming with noble, gentle animal life; with rolling pastures as green as May under great trees of crimson and gold; with flashing streams, and placid sheets of water, and great secluded homesteads—he, in turn, briefly described it; and she, loving the sensuous beauty of the world, listened more dreamily, merely repeating over and over, half to herself, and with more guarded courtesy half to him, "It must be very beautiful."

But whether she suddenly felt that she had yielded herself too far to the influence of his words and wished to counteract this, or whether she was aroused to offset his description by another of unlike interest, scarcely had he finished when she pointed towards a long stretch of woodland that lay like a mere wavering band of brown upon the western horizon.

"It was through those woods," she said, her voice trembling slightly, "that the procession of Trappists marched behind the cross when they fled to this country from France. Beyond that range of hills is the home of the Silent Brotherhood. In this direction," she continued, pointing southward, "is the creek which used to be so deep in winter that the priests had to swim it as they walked from one distant mission to another in the wilderness, holding above the waves the crucifix and the sacrament. Under that tree down there the Father who founded this convent built with his own hands the cabin that was the first church, and hewed out of logs the first altar. It was from those trees that the first nuns got the dyes for their vestments. On the floor of that cabin they sometimes slept in midwinter with no other covering than an armful of straw. Those were heroic days."

If she had indeed felt some secret need to recover herself by reciting the heroisms of local history, she seemed to have succeeded. Her face kindled with emotion; and as he watched it he forgot even her creed in this revelation of her nature, which touched in him also something serious and exalted. But as she ceased he asked with peculiar interest:

"Are there any Kentuckians among the Trappist Fathers?"

"No," she replied, after a momentary silence, and in a voice lowered to great sadness. "There was one a few years ago. His death was a great blow to the Fathers. They had hoped that he might some day become the head of the order in Kentucky. He was called Father Palemon."

For another moment nothing was said. They were standing side by side, looking towards that quarter of the horizon which she had pointed out as the site of the abbey. Then he spoke

meditatively, as though his mind had gone back unawares to some idea that was very dear to him:

"No, this does not seem much like Kentucky; but, after all, every landscape is essentially the same to me if there are homes in it. Poor as this country is, still it is all history; it is human life. Here are all the eternal ties and relations. Here are all the eternal needs and duties; everything that keeps the world young and the heart at peace. Here is the unchanging expression of our common destiny, as creatures who must share all things, and bear all things, and be bound together in life and death."

"Sister!" called up the nun waiting below, "is not the wind blowing? Will you not take cold?"

"The wind is not blowing, Sister, but I am coming."

They turned their faces outward upon the landscape once more. Across it wound the little footpath towards the farmhouse in the distance. By a common impulse their eyes rested upon the place of their first meeting. He pointed to it.

"I shall never forget that spot," he said impulsively.

"Nor I!"

Her words were not spoken. They were not uttered within. As unexpectedly and silently as in the remotest profound of the heavens at midnight some palest little star is loosened from its orbit, shoots a brief span, and disappears, this confession of hers traced its course across the depths of her secret consciousness; but, having made it to herself, she kept her eyes veiled, and did not look at him again that day.

"I think you have now seen all that could be of any interest," the aged Sister said doubtfully when they stood in the yard below.

"The place is very interesting to me," he answered, looking around that he might discover some way of prolonging his visit.

"The graveyard, Sister. We might go there." The barely audible words were Sister Dolorosa's. The scene of the temptation was to be transferred for the third time.

They walked some distance down a sloping hillside, and stepped softly within the sacred inclosure. A graveyard of nuns! O Mother Earth, all-bearing, passion-hearted mother! Thou that sendest love one for another into all thy children, from the least to the greatest, as thou givest them life! Thou that livest by their loves and their myriad plightings of troth and myriad marriages! With what inconsolable sorrow must thou receive back upon thy bosom the chaste dust of lorn virgins, whose bosoms thou didst mold for a lover's arms and a babe's

slumbers! As marble vestals of the ancient world, buried and lost, they lie, chiseled into a fixed attitude of prayer through all the silent centuries.

The aspect and spirit of the place: the simple graves placed side by side like those of the nameless poor or of soldiers fallen in an unfriendly land; the rude wooden cross at the head of each, bearing the sacred name of her who was dust below; the once chirruping nests of birds here and there in the grass above the songless lips; the sad desolation of this unfinished end—all were the last thing needed to wring the heart of Helm with dumb pity and an ungovernable anguish of rebellion. This, then, was to be her portion. His whole nature cried aloud against it. All his ideas of human life, civilization, his age, his country, his State, rose up in protest. He did not heed the words of the Sister beside him. His thoughts were with Sister Dolorosa, who followed with Ezra in a silence which she had but once broken since her last words to him. He could have caught her up and escaped back with her into the liberty of life, into the happiness of the world.

Unable to endure the place longer, he himself led the way out. At the gate the Sister fell behind with Ezra.

"He seems deeply impressed by his visit," she said in an undertone, "and should bear with him a good account of the convent. Note what he says, Ezra. The order wants friends in Kentucky, where it was born and has flourished"; and looking at Sister Dolorosa and Helm, who were a short distance in front, she added to herself:

"In her, more than in any other one of us, he will behold the perfect spiritual type of the convent. By her he will be made to feel the power of the order to consecrate women, in America, in Kentucky, to the service of the everlasting Church."

Meantime, Sister Dolorosa and Helm walked side by side in a silence that neither could break. He was thinking of her as a woman of Kentucky—of his own generation—and trying to understand the motive that had led her to consecrate herself to such a life. His own ideal of duty was so different.

"I have never thought," he said at length, in a voice lowered so as to reach her ear alone—"I have never thought that my life would not be full of happiness. I have never supposed I could help being happy if I did my duty."

She made no reply, and again they walked on in silence and drew near the convent building. There was so much that he wished to say, but scarcely one of his thoughts that he dared utter. At length he said, with irrepressible feeling:

"I wish your life did not seem to me so sad. I wish, when I go away to-morrow, that I could carry away, with all my thoughts of this place, the thought that you are happy. As long as I remember it I wish I could remember you as being happy."

"You have no right to remember me at all," she said quickly, speaking for the nun and betraying the woman.

"But I cannot help it," he said.

"Remember me, then, not as desiring to be happy, but as living to become blessed."

This she said, breaking the long silence which had followed upon his too eager exclamation. Her voice had become hushed into unison with her meek and patient words. And then she paused, and, turning, waited for the Sister to come up beside them. Nor did she even speak to him again, merely bowing without lifting her eyes when, a little later, he thanked them and took his leave.

In silence he and the old man returned to the farmhouse, for his thoughts were all with her. In the garden she had seemed to him almost as a child, talking artlessly of her sympathies and ties with mute playthings; then on the heights she had suddenly revealed herself as the youthful transcendent devotee; and finally, amid the scenes of death, she had appeared a woman too quickly aged and too early touched with resignation. He did not know that the effect of convent life is to force certain faculties into maturity, while others are repressed into unalterable unripeness; so that in such instances as Sister Dolorosa's the whole nature resembles some long, sloping mountain side, with an upper zone of ever-lingering snow for childhood, below this a green vernal belt for maidenhood, and near the foot fierce summer heats and summer storms for womanhood. All at once his plan of joining his friends the next day wavered in his mind for reasons that he could hardly have named.

And Sister Dolorosa—what of her when the day was over? Standing that night in a whitewashed, cell-like room, she took off the heavy black veil and hood which shrouded her head from all human vision, and then unfastening at waist and throat the heavier black vestment of the order, allowed it to slip to the floor, revealing a white under-habit of the utmost simplicity of design. It was like the magical transformation of a sorrow-shrouded woman back into the shape of her own earliest maidenhood.

Her hair, of the palest gold, would, if unshorn, have covered her figure in a soft, thick golden cloud; but shorn, it lay about her neck and ears in large, lustrous waves that left defined the contour of her beautiful head, and gave

to it the ærial charm that belongs to the joyousness of youth. Her whole figure was relaxed into a posture slightly drooping; her bare arms, as white as the necks of swans, hung in forgotten grace at her sides; her eyes, large, dark, poetic, and spiritual, were bent upon the floor, so that the lashes left their shadows on her cheeks, while the delicate, overcircling brows were arched high with melancholy. As the nun's funereal robes had slipped from her person had her mind slipped back into the past, that she stood thus, all the pure oval of her sensitive face stilled to an expression of brooding pensiveness? On the urn which held the ashes of her heart had some legend of happy shapes summoned her fondly to return? — some garden? some radiant playfellow of childhood summers, already dim but never to grow dimmer?

Sighing deeply, she stepped across the dark circle on the floor which was the boundary of her womanhood. As she did so her eyes rested on a small table where lay a rich veil of white that she had long been embroidering for a shrine of the Virgin. Slowly, still absently, she walked to it, and, taking it up, threw it over her head, so that the soft fabric enveloped her head and neck and fell in misty folds about her person; she thinking all the while only of the shrine; she looking down on this side and on that, and wishing all the while only to judge how well this design and that design, patiently and prayerfully wrought out, might adorn the image of the Divine Mother in the church of the convent.

But happening to be standing quite close to the white wall of the room with the lamp behind her, when she raised her eyes she caught sight of her shadow, and with a low cry clasped her hands, and for an instant, breathless, surveyed it. No mirrors are allowed in the convent. Since entering it Sister Dolorosa had not seen a reflection of herself, except perhaps her shadow in the sun or her face in a troubled basin of water. Now, with one overwhelming flood of womanly self-consciousness, she bent forward, noting the outline of her uncovered head, of her bared neck and shoulders and arms. Did this accidental adorning of herself in the veil of a bride, after she had laid aside the veil of the Church, typify her complete relapse of nature? And was this the lonely marriage-moment of her innocent heart?

For a moment, trembling, not before the image on the wall, but before that vivid mirror which memory and fancy set before every woman when no real mirror is nigh, she indulged her self-surrender to thoughts that covered her, on face and neck, with a rosy cloud more maidenly than the white mist of the veil.

Then, as if awakened by some lightning stroke of conscience, with fearful fingers she lifted off the veil, extinguished the lamp, and, groping her way on tiptoe to the bedside, stood beside it, afraid to lie down, afraid to pray, her eyes wide open in the darkness.

V.

SLEEP gathers up all the soft threads of passion that have been spun by us during the day, and weaves them into a tapestry of dreams on which we see the history of our own characters. We awake to find our wills more inextricably caught in the tissues of their own past; we stir, and discover that we are the heirs to our dead selves of yesterday, with a larger inheritance of transmitted purpose.

When Gordon awoke the next morning among his first thoughts was the idea of going on to join his friends that day, and this thought now caused him unexpected depression. Had he been older, he might have accepted this unwillingness to go away as the best reason for leaving instantly; but, young, and habitually self-indulgent towards his desires when they were not connected with vice, he did not trouble himself with any forecast of consequence.

"You ought not to go away to-day," the old housewife said to him in the morning, wishing to detain him through love of his company. "To-morrow will be Sunday, and you ought to go to vespers and hear Sister Dolorosa sing. There is not such another voice in any convent in Kentucky."

"I will stay," he replied quickly; and the next afternoon he was seated in the rear of the convent church, surrounded by rural Catholic worshipers who had assembled from the neighborhood. The entire front of the nave on one side was filled with the black-veiled Sisters of the order; that on the other with the white-veiled novices — two far-journeying companies of consecrated souls who reminded him in the most solemn way how remote, how inaccessible, was that young pilgrim among them of whom for a long time now he had been solely thinking. With these two companies of sacrificial souls before him he understood her character in a new light.

He beheld her much as a brave, beautiful boy volunteer, who, suddenly waving a bright, last adieu to gay companions in some gay-streeted town, from motives of the loftiest, mistaken heroism, takes his place in the rear of passing soldiery, marching to a martyr-like death; who, from the rear, glowing with a too impetuous ardor, makes his way from rank to rank ever towards the front; and who, at last, bearing the heavy arms and wearing the

battle-stained uniform of a veteran, steps forward to the van at the commander's side and sets his fresh, pure face undaunted towards destruction. As he thought of her thus, deeper forces stirred within his nature than had ever been aroused by any other woman. In comparison every other one that he had known became for the moment commonplace, human life as he was used to it gross and uninspiring, and his own ideal of duty a dwarfish mixture of selfishness and luxurious triviality. Impulsive in his recognition of nobleness of nature wherever he perceived it, for this sublime devotedness of purpose he began to feel the emotion which of all that ever visit the human heart is at once the most humbling, the most uplifting, and the most enthralling — the hero-worship of a strong man for a fragile woman.

The service began. As it went on he noticed here and there among those near him such evidences of restlessness as betray in a seated through high-wrought expectancy of some pleasure too long deferred. But at last these were succeeded by a breathless hush, as from the concealed organ-loft above a low, minor prelude was heard, groping and striving nearer and nearer towards the concealed motive, as a little wave creeps farther and farther along a melancholy shore. Suddenly, beautiful and clear, more tender than love, more sorrowful than death, there floated out upon the still air of the church the cry of a woman's soul that has offended, and that, shrinking from every prayer of speech, pours forth its more intense, articulate, and poor suffering need through the diviner faculty of song.

At the sound every ear was strained to listen. Hitherto the wont had been to hear that voice bear aloft the common petition as calmly as the incense rose past the altar to the roof; but now it quivered over troubled depths of feeling, it rose freighted with the burden of self-accusal. Still higher and higher it rose, borne triumphantly upward by love and aspiration, until all the powers of the singer's frame seemed spending themselves in one superhuman effort of the soul to make its prayer understood to the Divine forgiveness. Then, all at once, at the highest note, as a bird soaring towards the sun has its wings broken by a shot from below, it too broke, faltered, and there was a silence. But only for a moment: another voice, poor and cold, promptly finished the song; the service ended; the people poured out of the church.

When Gordon came out there were a few groups standing near the door talking; others were already moving homeward across the grounds. Not far off he observed a lusty young countryman, with a frank, winning face, who appeared to be waiting, while he held a child

that had laid its bright head against his tanned, athletic neck. Gordon approached him, and said with forced calmness:

"Do you know what was the matter in the church?"

"My wife has gone to see," he replied warmly. "Wait; she 'll be here in a minute. Here she is now."

The comely, Sunday-dressed young wife came up and took the child, who held out its arms, fondly smiling.

"She must have fainted. She had n't been well, and they did n't want her to sing to-day; but she begged to sing, and broke down." Saying this, the young mother kissed her child, and slipping one hand into the great brown hand of her husband, which closed upon it, turned away with them across the lawn homeward.

When Sister Dolorosa, who had passed a sleepless, prayerless night, stood in the organ-loft and looked across the church at the scene of the Passion; at the shrine of the Virgin; when she looked down at the white throng of novices; upon the dark throng of the Sisters, the common prayer of all of whom was to be borne upward by her voice, there came upon her like a burying wave a consciousness of how changed she was since she had stood there last. Thus at the moment when Gordon, sitting below, reverently set her far above him, as one looks up to a statue whose feet are above the level of his head, she, thinking of what she had been and had now become, seemed to herself as though fallen from a white pedestal to the miry earth. But when, to a nature like hers, absolute loyalty to a sinless standard of character is the only law of happiness itself, every lapse into transgression is followed by an act of passionate self-chastisement and by a more passionate outburst of love for the wronged ideal; and therefore scarce had she begun to sing, and in music to lift up the prayer she had denied herself in words, before the powers of her body succumbed, as the strings of an instrument snap under too strenuous a touch of the musician.

Gordon walked out of the grounds beside the rustic young husband and wife, who plainly were lovers still.

"The Sister who sang has a beautiful voice," he said.

"None of them can sing like her," replied the wife. "I love her better than any of the others."

"I tin sing!" cried the little girl, looking at Gordon resentfully, as though he had denied her that accomplishment.

"But you 'll never sing in a convent, missy," cried the father, snatching her from her mother. "You 'll sing for some man till

he marries you as your mother did me. I was going to join the Trappist monks, but my wife said I was too good a sweetheart to spoil, and she had made up her mind to have me herself," he added, looking at Gordon with a laugh.

"I'd have been a Sister long ago if you had n't begged and begged me not," was the reply, with the coquettish toss of a pretty head.

"I doin' be Tap monk," cried the little girl, looking at Gordon still more assertively, but joining in the laugh that followed with a scream of delight at the wisdom of her decision.

Their paths here diverged, and Gordon walked slowly on alone, but not without turning to watch the retreating figures of the simple group, his meeting with whom at such a moment formed an episode in the history of that passion under the influence of which he was now rapidly passing. For as he had sat in the church his nature, which was always generous in its responsiveness, had lent itself wholly to the solicitations of the service; and for a time the stillness, the paintings portraying the Divine sorrow, the slow procession of nameless women, the tapers, the incense, the hoary antiquity of the ceremonial, had carried him into a little known region of religious feeling. But from this he had been sharply recalled by the suggestion of a veiled personal tragedy close at hand in that unfinished song. His mood again became one of vast pity for her; and issuing from the church with this feeling, there, near the very entrance, he had come upon a rustic picture of husband, wife, and child, with a sharpness of transition that had seemed all but like the return of his spirit back into its own world of throbbing flesh and blood. There to him was the poetry and the religion of life—the linked hands of lovers; the twining arms of childhood; health and joyousness; and a quiet walk over familiar fields in the evening air from peaceful church to peaceful home. And so, thinking of this as he walked on alone and thinking also of her, the two thoughts blent, and her image stood always before him in the pathway of his own ideal future.

The history of the next several days may soon be told. He wrote to his friends the day following, stating that there was no game in the neighborhood, and that he had given up the idea of joining them and would return home. He took the letter to the station, and waited for the train to pass southward, watching it rush away with a subtle pleasure at being left on the platform, as though all bridges were now burned behind him. Then

he returned to the farm-house, where Ezra met him with that look of stupid alarm which was natural to him whenever his few thoughts were agitated by a new situation of affairs.

Word had come from the convent that he was wanted there for several days to move a fence and make changes in the garden, and, proud of the charge, he wished to go; but certain autumnal work in his own orchard and garden claimed his time, and hence the trouble. But Gordon, who henceforth had no reason for tarrying with the old couple, threw himself eagerly upon this opportunity to do so, and offered his aid in despatching the tasks. So that thus a few days passed during which he unconsciously made his way as far as any one had ever done into the tortuous nature of the old man, who began to regard him with blind trustfulness.

But they were restless, serious days. One after another passed, and he heard nothing of Sister Dolorosa. He asked himself whether she were ill, whether her visits to old Martha had been made to cease; and he shrank from the thought of bearing away into his life the haunting pain of such uncertainty. But some inner change constrained him no longer to call her name. As he sat with the old couple at night the housewife renewed her talks with him, speaking sometimes of the convent and of Sister Dolorosa, the cessation of whose visits plainly gave her secret concern; but he listened in silence, preferring the privacy of his own thoughts. Sometimes, under feint of hunting, he would take his gun in the afternoon and stroll out over the country; but always the presence of the convent made itself felt over the landscape, dominating it, solitary and impregnable, like a fortress. It began to draw his eyes with a species of fascination. He chafed against its assertion of barriers, and could have wished that his own will might somehow be brought into conflict with it. It appeared to watch him; to have an eye at every window; to see in him a lurking danger. At other times, borne to him across the darkening fields would come the sweet vesper bell, and in imagination he would see her entering the church amid the long procession of novices and nuns, her hands folded across her breast, her face full of the soft glories of the lights that streamed in through the pictured windows. Over all the details of her life more and more fondly he lingered.

And thus, although at first he had been interested in her wholly upon general grounds, out of these and out of his quick sympathy and his great pity, believing her secretly unhappy, and by thinking always of her, and watching for her, and walking often beside her in his dreams, with the folly of the young,

with the romantic ardor of his race, and as part of the never-ending blind tragedy of the world, he came at last to feel for her, among all women, that passionate pain of yearning to know which is to know the sadness of loving.

Sleepless one night, he left the house after the old couple were asleep. The moon was shining, and unconsciously following the bent of his thoughts, he took the footpath that led across the fields. He passed the spot where he had first met her, and absorbed in recollection of the scene, he walked on until before him the convent towered high in light and shadow. He had reached the entrance to the long avenue of elms. He traversed it, turned aside into the garden, and, following with many pauses around its borders, lived over again the day when she had led him through it. The mere sense of his greater physical nearness to her enthralled him. All her words came back: "These are daffodils. They bloomed in March, long ago. . . . And here are violets, which come in April." After awhile, leaving the garden, he walked across the lawn to the church and sat upon the steps, trying to look calmly at this whole episode in his life, and to summon resolution to bring it to an end. He dwelt particularly upon the hopelessness of his passion; he made himself believe that if he could but learn that she were not ill and suffering—if he could but see her once more, and be very sure—he would go away, as every dictate of reason urged.

Across the lawn stood the convent building. There caught his eye the faint glimmer of a light through a half-opened window, and while he looked he saw two of the nuns moving about within. Was some one dying? Was this light the taper of the dead? He tried to throw off a sudden weight of gloomy apprehension, and resolutely got up and walked away; but his purpose was formed not to leave until he had intelligence of her.

One afternoon, a few days later, happening to come to an elevated point of the landscape, he saw her figure moving across the fields in the distance below him. Between the convent and the farm-house, in one of the fields, there is a circular, basin-like depression; and it was here, hidden from all distant observation, with only the azure of the heavens above them, that their meeting took place.

On the day when she had been his guide he had told her that he was going away on the morrow, and as she walked along now it might have been seen that she thought herself safe from all intrusion. Her eyes were bent on the dust of the pathway. One hand was passing bead by bead upward along her rosary. Her veil was pushed back, so that between its black border and the glistening

whiteness of her forehead there ran, like a rippling band of gold, the exposed edges of her shining hair. In the other hand she bore a large cluster of chrysanthemums, whose snow-white petals and green leaves formed a strong contrast to the crimson symbol that they partly framed against her sable bosom.

He had come up close before the noise of his feet in the stubble drew her attention. Then she turned and saw him. But certain instincts of self-preservation act in women with lightning quickness. She did not recognize him, or give him time to recognize her. She merely turned again and walked onward at the same pace. But the chrysanthemums were trembling with the beating of her heart, and her eyes had in them that listening look with which one awaits the oncoming of danger from behind.

But he had stopped. His nature was simple and trustful, and he had expected to renew his acquaintanceship at the point where it had ceased. When therefore she thus reminded him, as indeed she must, that there was no acquaintanceship between them, and that she regarded herself as much alone as though he were nowhere in sight, all his feelings were arrested as if frozen by her coldness. Still, it was for this chance that he had waited all these days. Another would not come, and whatever he wished to say to her must be said now. A sensitiveness wholly novel to his nature held him back, but a moment more and he was walking beside her.

"I hope I do not intrude so very far," he said in a tone of apology, but also of wounded self-respect.

It was a difficult choice thus left to her. She could not say "Yes" without seeming unparadoxably rude; she could not say "No" without seeming to invite his further presence. She walked on for a moment, and then, pausing, turned towards him.

"Is there anything that you wished to ask me in regard to the convent?" This she said in the sweetest tone of apologetic courtesy, as though in having thought only of herself at first she had neglected some larger duty.

If he had feared that he would see traces of physical suffering on her face, he was mistaken. She had forgotten to draw her veil close, and the sunlight fell upon its loveliness. Never had she been to him half so beautiful. Whatever the expression her eyes had worn before he had come up, in them now rested only inscrutable calmness.

"There is one thing I have wished very much to know," he answered slowly, his eyes resting on hers. "I was at the church of the convent last Sunday and heard you sing. They said you were not well. I have hoped every

day to hear that you were better. I have not cared to go away until I knew this."

Scarcely had he begun when a flush dyed her face, her eyes fell, and she stood betrayed by the self-consciousness of what her own thoughts had that day been. One hand absently tore to pieces the blooms of the chrysanthemums, so that the petals fell down over her dark habit like snowflakes. But when he finished, she lifted her eyes again.

"I am well now, thank you," she said; and the first smile that he had ever seen came forth from her soul to her face. But what a smile! It wrung his heart more than the sight of her tears could have done.

"Then I shall hope to hear you sing again to-morrow," he said quickly, for she seemed on the point of moving away.

"I shall not sing to-morrow," she replied a little hurriedly, with averted face, and again she started. But he walked beside her.

"In that case I have still to thank you for the pleasure I have had. I imagine that one would never do wrong if he could hear you sing whenever he is tempted," he said, looking sidewise at her with a quiet, tentative smile.

"It is not my voice," she replied more hurriedly. "It is the music of the service. Do not thank me. Thank God."

"I have heard the service before. It was your voice that touched me."

She drew her veil about her face and walked on in silence.

"But I have no wish to say anything against your religion," he continued, his voice deepening and trembling. "If it has such power over the natures of women, if it lifts them to such ideals of duty, if it develops in them such characters, that merely to look into their faces, to be near them, to hear their voices, is to make a man think of a better world, I do not know why I should say anything against it."

How often, without meaning it, our words are like a flight of arrows into another's heart. What he said but reminded her of her unfaithfulness. And therefore while she all the time revolved how with perfect gentleness she might ask him to allow her to continue her way alone, she did what she could: she spoke reverently, though all but inaudibly, in behalf of her order.

"Our vows are perfect and divine. If they ever seem less, it is the fault of those of us who dishonor them."

The acute self-reproach in her tone at once changed his mood.

"On the other hand, I have also asked myself this question: Is it the creed that makes the nature of women so beautiful, or is it the nature of women that gives the beauty to the creed? Is it not so with any other idea that

women espouse? with any other cause that they undertake? Is it not so with anything that they spend their hearts upon, toil for, and sacrifice themselves for? Do I see any beauty in your vows except such as your life gives to them? I can believe it. I can believe that if you had never taken those vows your life would still be beautiful. I can believe that you could change them for others and find yourself more nearly the woman that you strive to be—that you were meant to be!" He spoke in the subdued voice with which one takes leave of some hope that brightens while it disappears.

"I must ask you," she said, pausing—"I must ask you to allow me to continue my walk alone"; and her voice quivered.

He paused, too, and stood looking into her eyes in silence with the thought that he should never see her again. The color had died out of his face.

"I can never forgive your vows," he said, speaking very slowly and making an effort to appear unmoved. "I can never forgive your vows that they make it a sin for me to speak to you. I can never forgive them that they put between us a gulf that I cannot pass. Remember, I owe you a great deal. I owe you higher ideas of a woman's nature and clearer resolutions regarding my own life. Your vows perhaps make it even a sin that I should tell you this. But by what right? By what right am I forbidden to say that I shall remember you always, and that I shall carry away with me into my life—"

"Will you force me to turn back?" she asked in greater agitation; and though he could not see her face, he saw her tears fall upon her hands.

"No," he answered sadly; "I shall not force you to turn back. I know that I have intruded. But it seemed that I could not go away without seeing you again, to be quite sure that you were well. And when I saw you, it seemed impossible also not to speak of other things. Of course all this must seem strange to you—stranger perhaps than I may imagine, since we look at human relationships so differently. Of course my life in this world can be of no interest to you. You cannot, therefore, understand why yours should have any interest for me. Still, I hope you can forgive me," he added abruptly, turning his face away as it flushed and his voice faltered.

She lifted her eyes quickly, although they were dim. "Do not ask me to forgive anything. There is nothing to be forgiven. It is I who must ask—only leave me!"

"Will you say good-bye to me?" And he held out his hand.

She drew backward, and as though to turn

away; but, overborne by emotion, he stepped forward, gently took her hand from the rosary, and held it a moment in both his own.

"Good-bye! But, despite the cruel barriers that they have raised between us, I shall always —"

She foresaw what was coming. She had not withdrawn her hand. But at this point she dropped the flowers that were in her other hand, laid it on her breast so that the longest finger pointed towards the symbol of the transfixed heart, and looked quickly at him with indescribable warning and distress. Then he released her, and she turned back towards the convent.

"Mother," she said with a frightened face when she reached it, "I did not go to old Martha's. Some one was hunting in the fields, and I came back. Do not send me again, Mother, unless one of the Sisters goes with me." And with this half-truth on her lips and full remorse for it in her heart, she passed into that deepening imperfection of nature which for the most of us makes up the inner world of reality.

Gordon wrote to her that night. He had not foreseen his confession. It had been drawn from him under the influences of the moment; but since it was made, a sense of honor would not have allowed him to stop there even had feeling carried him no further. Moreover, some hope had been born in him at the moment of separation, since she had not rebuked him, but only reminded him of her vows.

His letter was full of the confidence and enthusiasm of youth, and its contents may be understood by their likeness to all others. He unfolded the plan of his life — the life which he was asking her to share. He dwelt upon its possibilities, he pointed out the field of its aspirations. But he kept his letter for some days, unable to conceive a way by which it might be sent to its destination. At length the chance came in the simplest of all disguises.

Ezra was starting one morning to the convent for the work to be done there. As he was leaving the room, old Martha called to him. She sat by the hearthstone, with her head tied up in red flannel and her large, watery face flushed with pain, and pointed towards a basket of apples on the window-sill.

"Take them to Sister Dolorosa, Ezra," she said. "Mind that you see *her*, and give them to her with your own hands. And ask her why she has n't been to see me, and when she is coming." On this point her mind seemed more and more troubled. "But what's the use of asking *you* to find out for me?" she added, flashing out at him with heroic anger.

The old man stood in the middle of the room, dry and gnarled, his small eyes kindling

into a dull rage at a taunt made in the presence of a guest whose good opinion he desired. But he took the apples in silence and left the room.

As Gordon followed him beyond the garden, noting how his mind was absorbed in petty anger, a simple resolution came to him.

"Ezra," he said, handing him the letter, "when you give the Sister the apples, deliver this. And we do not talk about business, you know, Ezra."

The old man took the letter and put it furtively into his pocket, with a backward shake of his head towards the house.

"Whatever risks I may have to run from other quarters, he will never tell *her*," Gordon said to himself.

When Ezra returned in the evening he was absorbed, and Gordon noted with relief that he was also unsuspecting. He walked some distance to meet the old man the next two days and his suspense became almost unendurable, but he asked no questions. The third day Ezra drew from his pocket a letter, which he delivered, merely saying:

"The Sister told me to give you this."

Gordon soon turned aside across the fields, and having reached a point screened from observation he opened the letter and read as follows:

I have received your letter. I have read it. But how could I listen to your proposal without becoming false to my vows? And if you knew that I had proved false to what I held most dear and binding, how could you ever believe that I would be true to anything else? Ah, no! Should you unite yourself in an ideal life to one who for your sake had been faithless to the ideal of womanhood which she still regarded as supreme, you would soon withdraw from her the very love that she had sacrificed even her hopes of heaven to enjoy.

But it seems possible that in writing to me you believe my vows no longer precious to my heart and sacred to my conscience. You are wrong. They are more dear to me at this moment than ever before, because at this moment, as never before, they give me a mournful admonition of my failure to exhibit to the world in my own life the beauty of their ineffable holiness. For had there not been something within me to lead you on — had I shown to you the sinless nature which it is their office to create — you would never have felt towards me as you do. You would no more have thought of loving me than of loving an angel of God.

The least of all the reparation I can make for my offense is to tell you that in offering me your love you offer me the cup of sacred humiliation, and that I thank you for reminding me of my duty, while I drain it to the dregs.

After long deliberation I have written to tell you this; and if it be allowed me to make one request, I would entreat that you will never lay this sin of mine to the charge of my religion and my order.

We shall never meet again. Although I may not listen to your proposal, it is allowed me to love

you as one of the works of God. And since there are exalted women in the world who do not consecrate themselves to the Church, I shall pray that you may find one of these to walk by your side through life. I shall pray that she may be worthy of you; and perhaps you will teach her sometimes to pray for one who will always need her prayers.

I only know that God orders our lives according to his goodness. My feet he set in one path of duty, yours in another, and he had separated us forever long before he allowed us to meet. If, therefore, having thus separated us, he yet brought us together only that we should thus know each other and then be parted, I cannot believe that there was not in it some needed lesson for us both. At least, if he will deign to hear the ceaseless, fervent petition of one so erring, he will not leave you unhappy on account of that love for me which in this world it will never be allowed me to return. Farewell!

The first part of this letter awakened in Gordon keen remorse and a faltering of purpose, but the latter filled him with a joy that for the time excluded every other feeling.

"She loves me!" he exclaimed; and, as though registering a vow, he added aloud, "And nothing—God help me!—nothing shall keep us apart."

Walking to a point of the landscape that commanded a view of the convent, he remained there while the twilight fell, revolving how he was to surmount the remaining barriers between them, for these now seemed hardly more than cobwebs to be brushed aside by his hand; and often, meanwhile, he looked towards the convent as one might look longingly towards some forbidden shrine which the coming night would enable him to approach.

(To be continued.)

James Lane Allen.

IN MAIDEN MEDITATION.

I want a hero: an uncommon want,
When every year and month sends forth a new one.

MISS ROSMARY sat gazing at the famous Jean François Millet. Her aunt, who, as all the world knows, is the sole relative of the heiress and reigning beauty, had bought the picture at the last sale, and only within a day or two had it been sent home and hung in the gallery of the great house, that grim pile stretching so many precious feet along the Avenue, which the famous Mr. Rosmary had left to his only child.

Miss Rosmary's thoughts ran in mingled reverie. She was at half angry, half contentious, odds with the world just now, and it was not strange to her that the unfortunate painter had been left to creep through a sad life to a dismal grave. But, after all, would he have been happier in another existence? Even if his peasants—those sad, powerful, poetic creatures—should step from their frames into the ducal palaces and the mansions of millionaires that now gave so many of them harborage, would they not find all about them trivial, unsatisfactory, provoking? The existences of those about them might bring wonder to the brain and a shadow of fear to the hearts of such simple-fibered, little-gifted, meager-lived folk as the broad-natured villager of Barbizon had painted—still would such lives not appear to them contemptible? And then Miss Rosmary tapped a petulant foot upon the polished floor. But Miss Rosmary—and she quite understood herself—was not by any means dissatisfied with this sublunary globe. Nor was humanity as a

whole, or in imagined instances, at all out of the way to her. The trouble was with the world which is implied when the word is used in a restricted sense—the world which is, after all, the true world to each of us; the universe of our daily round, of our friends and of our enemies, of our loves and of our hates, of our hopes and of our fears, of our deeds and of our misdeeds. Her life, it seemed to her, was vapid, void, although to all others it appeared to be as full and as finely accented an existence as was possible to a young woman in the very flush of the restless, feverish society of this our America towards the last of the hurrying years of this rapid-footed century—a society she thought shallow, imitative, wholly unoriginal; forgetting that the ingenious ages that have accomplished so much have only been able to discover a very few ways in which people may amuse themselves. But Miss Rosmary scarcely ran into such an analysis as she sat and looked at the picture so filled with the pathos of patient, common existence. Perhaps it had an unperceived appeal to her, for the foot committed a little stamp,—it might be self-condemnatory, it might be self-assertive,—and then Miss Rosmary arose and walked across the room. She paused before a Meissonier. What truth of drawing, what real breadth, what spirit in the few square inches of the picture! What a gentleman of the gallant time! How quick would have been his foot along the gay paths of adventure, how ready the sword at his side if the zest of hazard led to the point of danger! Both

pictures added to her discontent with all about her; with the real sameness of the things to which her most modern and modish life confined her; with the sameness of the people who in the contentment of their unmeaningness perplexed her. Was there nothing but capricious punctilio and artificial ritual; was there not something down in the press of the common world where the dust half hid the conflict; might not lives be found there, strong, inspiring, effectual lives that would justify creation? And in the shadowy and tenuous haze of her dissatisfaction there was a well-defined nucleus of denser discontent — discontent with things happening in almost regular recurrence to herself. Coequal womankind of course did not please her,—she had only one friend who perfectly understood her and whom she perfectly understood,—but mankind, masculine mankind!

An aggressively, negatively unobjectionable young man, without a merit or a prospect, had offered her his very gentlemanly looking hand and something he called his heart, at about two that morning. Really the thing was getting to be of too frequent occurrence. There were so many of them, so much alike, with their pale faces, their trained accents, their consummate dress, their routine lives, their routine topics — their clubs, their races, their hunting, and themselves. Of course she detected slight differences in them,—there are differences in the dress-coated, white-waistcoated, full-dressed swallows that sit along the telegraph wire, ignorant of the tidings of the world flowing at their feet,—for they did not all talk to her about the same things, although they did in much the same manner and in much the same tone. Here, one favored her with languid pessimistic doubts; there, one drawled complacent negations, as if such things as establishing a race in unhappiness or depopulating the heavens were easily within the day's work of either. Some were ill of many things; they had caught esthetic ailments of which they never would be cured unless beauty were out of fashion; they suffered from complicated sentimental afflictions from which their recovery was only too certain. And there were those who employed language in accounts of exploits across the fences of neighboring counties, and the annotators of the gossip of the day — the latter perhaps the best worth hearing after all, she sometimes thought, for they were always so much more simple and natural.

She knew that in most girls there is something left over from childhood that leads them to take delight in terrifying themselves, in imagination, with the exact-coated entities they see so often and of whom they know so little, as in younger years they took delight in frightening

themselves with the terrors of a jack-in-the-box. They like to feel the same thrill when, with unperceived glance, they see these wonderful beings gazing from out mysterious inaccessibility through a club window, that they experienced when taken to some circus they saw the animals in their cages. But in the lives of such as those who surrounded her Miss Rosmary found no more to excite her imagination than she might in the course of a letter sent through the post-office. What chance was there, then, for such as he who had so kindly taken his negative in the De Jones's conservatory at 2 A. M.? Does any one suppose that a girl falls in love with a mere man? There is no such real difference between two fairly presentable masculine creatures as there is between either of them and the being a young girl's imagination makes of one and not of the other, if it is in the one to arouse imagination and give it wing. Miss Rosmary had lost or mislaid not a little of her temper as she was driven home the night before. The wheels ground heavily on the pavement; all but one or two of the overworked echoes of the Avenue had taken themselves off to their tenement houses; just past her aunt, half asleep and leaning her head against the side of the carriage, she caught glimpses of the grouped and scattered stars in unobstructed space. Was not the world wider than the "precincts of a billet-doux"? Were there not men somewhere; men who were strong to do things and did them; men whose failures even would awaken interest; men whose successes would excite exultant pride? How without such as these would the world have advanced so far; how would great discoveries have been made, and great fortunes; how brave deeds done and great books written? Had she seen any in the last hours, any in that atmosphere heavy with the odors of flowers, astir in flow and pulsation, as music swelled or softened, murmurous and eddying in the undertones and ripples of talk and laughter — had she seen any who would take the enlisting shilling from Effort, Fame's sergeant and orderly?

And then she laughed at herself.

Of what was she thinking? Her thoughts ran back to a being of younger fancy, of more unformed dream — a Ruy-Blas-Hernani sort of creature, daring, resolute, sometimes arbitrary, but always commanding, bearing down doubt with scant ceremony, wooing with humility shown only to herself, carrying her away almost forcefully if need be, but always with that best gentleness, the gentleness of the strong. And, after all, was her present hero less spectacular, less dramatic? Or had the drama, its laws, its tone, only changed? Was she as absurd now as then? She was sure she was not. There was romance in the world

since there were endurance, and effort, and the glad spirit of adventure; and where there was romance there were men and women such as those of whom she dreamed, for—her argument ran in such circle—without such men and women there would be no romance.

"The morning's mail, Miss Rosmary," said a servant, entering.

She took half a dozen letters from the man, hastily looked them over, selected two as worthy of earliest attention, and as she opened the first letter she hummed, almost sang, three lines from the song of the Blind Beggar "in a silken cloak," from the old ballad.

When first our king his fame did advance,
And sought his title in delicate France,
In many places great perils past he—

and then she read:

"— BEACON STREET, BOSTON, MASS.

"DEAREST MILLICENT: I know I am your only and your half-desperate friend. Yesterday was my birthday—twenty-two. But I think a girl's life should be counted double; I always think of summer as one year and winter as another. Twenty-two! I am forty-four if I am a day. No one here can give me satisfactory sympathy, as no one can understand my troubles. But you—you know me, and you know how much a very modern girl has against her in having so much for her. You recognize our emancipation; you appreciate the embarrassment of our freedom—our freedom without guiding precedent. You know that we have thrust upon us new knowledge, new opportunities; that we must think, decide, act; that as well as old duties to others, we have new duties—to ourselves. You know all these things,—none better than you,—and you will understand me when I say that I am suffering from one of my not unusual attacks of acute conscientiousness, aggravated this time and with peculiar symptoms.

"You have heard a good deal about me. I did not like your last letter because it did not tell me what; and you know that I would tell you everything if there only could be everything to tell. And—well—very well—if you'll let me do it in my own way.

"You know my exacting nature. You know with what antagonism I stand against the world if it does not continually give me its superlatives, its quintessences; and—they want me to marry a man who is not a particle of a paragon. I am living in what in our old Latin grammar—I never studied an English or a French one, and I am not sure if it is the same in those—I think was called the first person singular of the pluperfect subjunctive. 'I might, could, would, or should have loved.'

I might have loved had Providence seen fit to give me a humble spirit, a meek, unquestioning heart; I could have loved if I had ever met a master for my irreverent nature; I would have loved undoubtedly in spite of all, if I had been—my own grandmother, if I had not been filled with imperative intellectual needs, with positive artificial wants, trained to criticize, analyze, and dissect myself until I am incapable of a natural, spontaneous, blundering, unquestioning impulse; I should have loved, yes,—I should indeed have loved, and no one knows it better than myself,—I should have loved if I desired the usual happiness of a usual world. But I never have, and I fear I never shall. They want me to love, but what can I do if I can't? Change the man and try another? I have done this at times, and my failures have been pitiable. My future sits before me grinning like an old hag. I shall grow sharper, more cynical with the passing seasons, until I become the fright of the callow, and, with my unimpressionable, knowing old heart, the terror of the mature. But am I to blame? You and I know that I am not.

"It is a vast theme that I have just started—that I am not my own grandmother. I look at Copley's picture of her in her youth—did I send you my last photograph? There's a contrast. She's ahead of me in prettiness, I fear; but I think of her as I saw her in her old age, and I know that I could give her, were she here, subjects, questions, suggestions that would frighten her into wakefulness. I cannot be satisfied with the things that satisfied her. I may be vain of my invaluable sex, but it is plain to me that, in what we are, as in our requirements, we have advanced as far beyond our foremothers as our masculine complements have fallen behind their forefathers. Would to-day's men fight for a principle? Some did twenty and more years ago; but I dance with none such now. To lead a cotillion is their most desperate deed; would they lead a forlorn hope, or even a hope not forlorn?

"You know that it has for some time been the desire of my amiable family to see me safely married. They attempt concealment with such extraordinary care that I know precisely what they try to hide, and I resent their uncomplimentary fear that my money exposes me to many grievous dangers—dangers such as they evidently do not apprehend from my charms. Every model, every fairly eligible man,—and they are not particular about years,—has been paraded before my undazzled eyes. Until lately such attacks upon my peace of heart have been desultory, unsystematic; but for the last few months the family efforts have been constant, concentrated, thoroughly purposeful. One individual has been chosen out

of all the world to make me supremely happy, and he, fortunate or unfortunate, is on all occasions, natural or forced, thrust into my society and bepraised beyond all patience. Of course you think that I must detest him. But I do not; I almost a little more than endure him. Our respective and respected families have long been intimate,—indeed, in colonial times I think there was some intermarriage and that he is a kind of far-away cousin of mine,—but I really have known but little of him. He was abroad with his father during the three years before he entered Harvard, and then for four years I was away myself. He returned only a few months ago from a trip around the world in his yacht. He is perfectly typical and perfectly commonplace. He leads a life of half-busy, half-idle leisure; he drives one of the most accurately equipped coaches in the country; he has one of the finest old homes in the city and one of the finest new houses in Newport; his name hangs prominent upon a main branch of that stiffly drawn production, a colonial genealogical tree; he is a perfect multitude of such merits; but to me he possesses only one—that he does not seem to care to please me, for the traits of the man of my vision are neither nautical, equine, vehicular, architectural, nor historical.

“And this is the man that they want me to marry. Through life you and I have been fed, so to speak, on the whitest, closest-winnowed wheat; we have read the best books; we have heard the best music; we have seen the best pictures; no great statue gives the world the charm subtler than all color, the charm of pure line and complete form, that we have not seen; that polished conglomerate which you think you so detest, the curiously grained and veined thing they call society, we have known at its best the world over; all that we have gained or garnered has been attempered by a faith the keynote of which is vicarious suffering, the agony of divine sacrifice. These, all these, are the fruits of effort. And is a woman, a woman to whom a shock to taste is severer than physical pain, to fall in love, to be dragged into love of something masculine without a hand’s motion towards worthy attainment—of an idler who does not earn his place so well as we do ours? I will have no bankrupt to existence, no man who does not pay the world his debt. I—please do not laugh—I remember that last autumn at Lenox you told me that I dreamed of a marvel—a combination of Count d’Orsay, Shelley, and James Nasmyth. Perhaps, but I see what I see.

“It will all come to nothing. He does not really care for me; I, not at all for him—not enough even to care that he does not care for me. I would tell you, of course, if there were

danger—or hope—or anything, but there is not, nor will there ever be.

“I could write a great deal about two or three new actual engagements here, but I believe you want to hear what I want you to hear—about myself from myself. I have told you but little after all; really nothing you did not know or suspect. It will be a long time, Millicent, I fear,—we are pottery or such indutile and tenacious clay,—before either of us has more to tell the other.

“Incessantly yours,

“JANET.

“P. S.—I forgot to say I refused him two weeks ago.”

Miss Rosmary did not lay the letter down; she sat with eyes upon it as she held it in up-lifted hand.

Miss Rosmary, who had never seen him, could see as plainly as if he were visibly before her the man to whom they wished to marry her friend. She thought that she knew the kind perfectly—a useless creature, solicitous about his dress but ignorant of a manner; whose groom broke his horses for him; who would not have dared sail his own yacht; who was indifferent as to what the world thought of his brains but was proud of the fame of his millions; who would rather be a guest at Sandringham than master of the White House. What could such a man as this Gerald Massie—the gossips had given her the name—do? And what could the others like him, that she knew so well, do that would be worth the doing? She did not demand much; she was very reasonable, she assured herself. She only asked that a man should be strong, forceful; that he should have done something, or proved to her his capability for doing something, to awaken her respect or excite her sympathy. But among those she knew or was likely to know!

Miss Rosmary opened her second letter in quick impatience.

“ELECTRA, MONTANA.

“MY DEAR MILLICENT: Of course you are surprised to receive a letter from me written from this place; but here I am, and here I shall be detained for several days. I am here, and—don’t skip—you will learn why in the climax of my letter.

“Several things not common to a club man—a tame man of the city’s wilderness—have happened to me since I saw you last; things I can tell you worth the telling, and which could best be told in some twilight when the lingering dinner has just died in its glory, but which I will nevertheless attempt to tell you now, so anxious am I that you should know them, and so sure am I that they will interest you. If I was a wise man I would not do

it, for I shall only be giving you an opportunity to say 'I told you so'; but when I am enthusiastic I am never wise, and I am enthusiastic now.

"I suppose that they have been selling violets for a long time on the corners of Fifth Avenue, and that even the watering-carts are out. They are having out here what they call spring; it is to me rather the disturbed end of a vicious winter dying slowly, and like a stage villain torn into agonies by an aroused conscience. It has been cold; great storms have been frequent; the earth has been deluged, and every stream is swollen.

"I know that you never read the newspapers, unless it is to see that you have been at a place where you never thought of going, or were engaged to a man who had never been presented to you; but even if you did read them, so insignificant a fact as what happened to an express train in the far Northwest, carrying a hundred and thirty-nine passengers,—among whom was the amiable and fairly appreciated writer of these lines,—would make but small show in the condensation of the Associated Press despatches, and would not be likely to attract your attention.

"The railroad from Electra to Cartonsville runs through great, almost uninhabited barrens, and at Black's Ford crosses the river. It is a wild, desolate country all around; some convulsion of nature has torn out the channel in which the stream runs between high, broken, and rocky banks. Day before yesterday the inhabitants of Black's Ford, fifty in number, perhaps, noticed that the water was rising rapidly. My informant, an engineer's rod man, left there to see that the bridge is kept clear and the signal light at the end properly shown—my informant, whose account of what was said I follow quite closely, tells me that nothing like it had ever been known there before.

"The gray clouds broke raggedly at sunset, a fierce, yellow light blazing through every rift; the wind rose, and so prevailed that men with difficulty kept their feet; children were caught up by any one near and carried home. When the night shut down but few were gathered at the small store, the only place of the kind at Black's Ford—my informant among the rest. All except one belonged to the settlement—a stranger, a young man who had been driven over from a neighboring ranch, and who evidently awaited the arrival of a train. He said nothing; and though curious eyes were turned on him, even the garrulous storekeeper forbore putting him to the question.

"It was not wholly dark outside; there was no moon, but the stars shone brightly, and it seemed not far away between the driven, goaded clouds. The wind gathered even more strength;

space seemed filled with its sound. It roared between the river banks; it shuddered through the framework of the bridge; at the corners of the buildings strips seemed torn from it upon their edges. Its shrill whistle was like the sound of ripping silk; along the barren uplands ran noises as of knives whetted upon unwet stone.

"The door of the store was thrown suddenly open and a man shouted:

"'Come out here, all of you! We're afraid the bridge will go.'

"Even as he stood in the doorway his voice could hardly be heard above the uproar outside.

"All sprang to their feet; the greater number hastened to the not distant river bank. The black outlines of the great bridge stood, here, clearly defined against the sky; there, lost against the massed, hurrying clouds.

"'She'll go,' said one, 'sure.'

"'She must,' assented another. 'She can't stand it long.'

"'See, see!' cried a third; 'how the water climbs up the abutments.'

"As the mantle of the Tishbite divided the waters, so the sheeted wind seemed to drive before it flood upon flood.

"Suddenly the storekeeper spoke.

"'When's that train due?' he shouted.

"'In an hour,' was the answer from all sides.

"'If it don't hold up for that time the train's gone,' said the storekeeper, solemnly.

"Almost as he spoke, with such tremor as may come before dissolution, with groaning outcry, with the sharp crack of iron torn apart, with gathering roar, the massive structure bent, broke, and fell with slow, final crash into the raging river. From the abutments hung iron rods torn from their fastenings, twisted, contorted, threatening as vipers knit around some fateful head.

"'The train's lost!' said some one above the low murmur that was almost a wail.

"None dissented; none spoke. The river seemed roaring, growling for its prey; the rocks on the bank were thrust out like fangs through the foam.

"'Is there no way to give warning?' asked the stranger, speaking for the first time.

"'How'd you do it?' demanded the storekeeper, in the tension of the moment turning angrily upon him.

"'Is there no other way of getting across?' asked the other, quietly.

"'None.'

"'No signal to be given?'

"'No,' said the station-master. 'They'll drive right into the river unless there's a light shown half a mile up the track.'

"'Who's to do it?' asked the stranger.

"'It can't be done.'

"'Can't we swim the river?'

"The station-master glanced down the bank and laughed in half derision.

"'Do you think any man could get through that?' he asked sneeringly.

"'A man might try.'

"'Who?'

"'I, for one,' answered the stranger.

"'It's death,' said some one.

"'Bring me that light yonder,' continued the stranger in a quick, commanding tone, 'and hang another in its place.'

"No one stirred.

"'Do you hear me?' he shouted, as he threw off his coat. 'Bring me that light.'

"After hesitating a moment, suspicious of being sent on a fool's errand, so little likely did it seem that any one would have such hardihood, one of the men ran towards the post where shone a small lamp with a red light.

"The stranger tightened the belt about his waist, walked to the water's edge, and stood waiting for the lamp.

"'Give me matches,' he said.

"Some were handed to him.

"'And an oil-skin coat.'

"Several were offered; he grasped the nearest and with quick, strong hand cut from it two pieces. He wrapped one hastily around the matches and thrust the parcel into the bosom of his shirt; the other he wound around the lamp after blowing out the light.

"Having made his hasty preparations, he stood for an instant gazing at the stream; then suddenly he cast off his shoes, stepped into the river, struck out, and in a moment was lost to sight in the darkness.

"'By ——!' but the storekeeper suppressed his oath — 'when souls are saved he'll be sure of his salvation, I don't care what else he's done or has n't.'

"As if the unuttered but understood oath gave solemnity to what was said, one of the men, in low, determined voice, cried 'Amen.'"

MISS ROSMARY'S hand caught the letter tighter; her eyes shone with excited light. In a moment she read on.

"As a crowd lining a race-track when the horses sweep to the winning post, so all stood rigid and silent along the shore, with craning necks and eager eyes; stood and saw nothing, heard nothing but the wind and the rushing water; stood so lost in strained attention that time was really the nothing that it is.

"'He's stopped her or we'd have seen her headlight before this,' said one.

"'She's often late,' answered another.

"None disputed this.

"'Perhaps we could n't see her lights over here this weather,' said the first as the rain began to fall in torrents.

"'I tell you we could,' said the storekeeper. 'A man's a fool who'd think he could n't.'

"None spoke; all knew that the angry tone of the last speaker was a protest against losing hope. They all stood now grouped together, grouped as are frightened cattle. But they were gathered in more than fear; they stood in awe, in silence, as men stand around a closing grave.

"OUR train came to a stop with a suddenness that brought every passenger to his feet. I looked hastily out of the window. The darkness was piled against the pane like black marble in a quarry; the wind shrieked around the train as a maniac might, finding some strange obstruction in the path of his escape. I hastened forward with the others. I leaned from the platform of the first car and looked and listened. Just in front of the train I could see moving lights.

"'He has fainted,' were the first words I made out.

"'What has happened?' I asked the conductor, who had been forward, as he came rapidly along.

"'The bridge below's been carried away, and if that young man had n't come from God knows where with his light, we'd all have been in the river with the train on top of us. Is any one of you a doctor?'

"You know about my year or two at Bellevue; perhaps I could aid, and I hastened down the track. They had lifted him off the rails and lamps were held over him as he lay. His eyes were closed; he was senseless, but his jaws were set in relentless resolve. We carried him to the forward car. The train was backed seven miles to this place, and here I am.

"The young man is still too weak to give any account of himself. I am acting as his nurse, and am writing in the room next to the one in which he lies. I certainly shall not leave my patient for a day or two.

"And now you will remember what you have always said; will remember our many contentions; remember your repeated assertions that one must go far to find a man among men — that among none whom you saw could a man be found: and you will remember too with what serene confidence I have repeated to you that the great Duke said, 'The dandies fought well at Waterloo.'

"I will let you know immediately what I am going to do when I have finally decided.

I do not like to leave this young man. He has done a fine thing and I am going to see him through. I am old enough to know better, but I don't.

"Sincerely your friend and guardian,
"JAMES GILCHRIST."

Miss Rosmary dropped the letter and sat silent. She looked about her. What pretenses the pictures were — what mere pretenses, and the world in which she lived. Miss Rosmary started to her feet with flushed cheeks. Why could she not know men like that? Poor fellow, she thought, if she could only see him;

could even help to care for him. How stupidly the letter was written. Nothing at all — "A telegram, Miss Rosmary," said the servant, entering hastily.

Miss Rosmary tore open the yellow envelop. The despatch was from Chicago, and ran:

"Of course you have received my letter written at Electra. Our rescuer turns out to be Gerald Massie of Boston, visiting a friend's ranch. He is entirely recovered, and comes with me. I have taken the liberty of asking him up the river, where I suppose your aunt and yourself soon go. Wonderful, is it not?"
JAMES GILCHRIST."

George A. Hibbard.

CHINESE MUSIC.

THE musical art of a people who represent one-fifth of the earth's population ought to be studied; if not for the sake of esthetic pleasure, at least in the interest of scientific knowledge. Yet there is scarcely a department in the history or philosophy of music concerning which the information to be found in the books is so unsatisfactory as that of Chinese music. Even a historian of the thoroughness and profundity of Ambros, after devoting many pages to an attempt to elucidate the Chinese theory, seems willing to believe the first traveler who sets down the modern practice of the art as nothing but crude, barbaric, unregulated noise. Crude, barbaric, and noisy Chinese music certainly is, but not unregulated. Even the little music which can be heard on any holiday in the Chinese quarter of New York will serve to disclose to a discriminating ear that it is nothing if not methodical. The difficulty on the part of the historians has been that they have never come in contact with the Chinese, and therefore have had to depend on the descriptions of travelers and missionaries touching the practical side of the art. Correctly to apprehend music, however, requires special qualifications of education and natural gifts, and these have been possessed by so small a minority of those who have written about China that they are scarcely worth enumerating. There has been one brilliant exception to the rule, and to him, to Père Amiot, we owe the greater part of what we know specifically about the history, theory, and philosophy of Chinese music. Amiot was a Jesuit missionary in Peking for forty-four years (from 1750 till his death in 1794), and the sixth

volume of his exhaustive "*Mémoires concernant l'histoire, les sciences, les arts, les mœurs, les usages, des Chinois*" is entirely devoted to a discussion of the ancient and modern music of the Middle Kingdom. An admirable disquisition on the subject in our own language (though, to judge by his name, written by a Dutchman) is a pamphlet of eighty-four pages by J. A. Van Aalst, of the Chinese imperial customs service, published at Shanghai by the statistical department of the Inspectorate General of Customs about five years ago.

So far as concerns the side on which music comes in contact with man's inner nature, the Chinese have stood for ages where the Greeks stood at the time of Plato; and, if their chronology be accepted, centuries before the great Greek philosopher lived their sages distinctly enunciated principles which Plato echoed. In their theories there is much that is merely fanciful, but there is also a strong undercurrent of truth which the estheticians of to-day cannot afford to despise or ignore, for it flows from a close study of the nature, relationship, and effect of musical sounds. The refinement in their knowledge of music, however, is mostly on its metaphysical side. The Chinese sages published doctrines which the modern thinkers of the Occident are bound to accept; but when the descendants of these sages in the nineteenth century attempt to make music they produce a din in which traces of rhythmical order and melodious sequence of tones are not discernible except by a patient and trained ear. It is possible that this paradox is due partly to the destruction of the classic Chinese music in the third century before Christ, when the Emperor She Huang-ti ordered all books to be destroyed except those relating to medi-

cine, agriculture, and divination; but I am inclined to think that the Chinese talk about the degeneracy of their modern art is of a piece with that extravagant estimation of what is gone which is common enough outside of China. But this question aside, it seems to me that it is just this paradox, this strange discrepancy between what it ought to be and is, between its philosophy and its practice, between the harmony of its literature and the discord of its instruments, that makes Chinese music a most fascinating and profitable study. But it is fascinating and profitable not so much for its own sake as for the sake of the light which it throws on the music of peoples to whom we stand in the relation of intellectual heirs. In a sense Chinese music is the proverbial fly in amber.

To my mind there is something almost providential in the circumstance that so vast and ancient a people was seized thousands of years ago with a conservatism that has done a service for the modern investigator similar in kind to that performed by the dry climate and sand of Egypt. The service is similar but much greater. China to-day shows us a picture of marvelous antiquity, not dead and embalmed, but living. Its language represents the speech of humanity's childhood. Its ideographic texts, still holding fantastic suggestions of the yet more primitive hieroglyphs from which they were evolved, represent a stage in the art less removed from picture-writing than the demotic texts of Egypt. Where modifications or reforms of any sort reveal themselves they do not seem really to have penetrated far below the surface of the huge antique life. In spite of the teachings of Laotseu, Confucius, and the Buddhist priests, the religious heart of China to-day is that of primitive man. The religion of the Great Pure Kingdom is still the artless religion of ghosts, the ancestral family cult, the worship of the dead.

Having such a beautiful case of arrested development before us, why should we not utilize what it teaches to the understanding of other antique arts that left us no monuments for present study?

The most ancient poets of China speak of music as the "echo of wisdom"; the "manifestation of the laws of heaven"; the "mistress and mother of virtue." In the "Book of Rites" you may read:

Music is the expression of the union of earth and heaven. With music and ceremonies nothing in the empire is difficult. Music acts upon the inner nature of man and brings it into connection with the spirit. Its principal end is to regulate the passions. It teaches fathers and children, princes and subjects, husbands and wives, their reciprocal duties, and the sage finds in music the rules of his conduct.

Says the "Musical Recorder" (I quote this passage from Van Aalst):

Music proceeds from the heart of man. The harmony of the heart produces that of the breath; the harmony of the breath produces that of the voice; and the voice is the emblem of the harmony existing between heaven and earth.

According to the doctrines of the school of Confucius, ceremonies and music are the most prompt and efficacious factors for reforming manners and making the state prosperous. Mencius says, "By viewing the ceremonial ordinances of a prince we know the character of his government; by hearing his music we know the character of his virtues." Mat-tuan-li says, "He who understands good music is fit to govern." And now for a Chinese definition:

Music is a language which enables man to give expression to his emotions. If we are sad, our tones will betray the fact. In moments of joy our voices sound out high and clear and our words flow rapidly. In anger our speech is powerful and threatening; in fear and reverential timidity, gentle and modest; in love, without rudeness. In brief, every passion has its peculiar mode of expression, and good music must provide the just tones for it; for each tone must answer to its nature and make itself apprehended. Tones are the words of the musical language; modulations, the phrases. Voice, instrument, and dance unite to form that to which expression is to be given.

Here is a definition on which it would be difficult to improve, and taken in connection with a decree of the Emperor Chun (B. C. 2300), it might be said to be as good a foundation as is needed for Wagner's system of lyrico-dramatic composition. In this decree occur these words:

Teach the children of the great that through thy care they may become just, mild, and wise; firm, without severity; upholding the dignity and pride of their station without vanity or assumption. Express these doctrines in poems, that they may be sung to appropriate melodies accompanied by the music of instruments. Let the music follow the sense of the words; let it be simple and ingenuous, for vain, empty, and effeminate music is to be condemned. Music is the expression of the soul's emotion; if the soul of the musician be virtuous, his music will be full of nobility and will unite the souls of men with the spirits of heaven.

A little familiarity with the Greek classics will disclose parallels in plenty to doctrines like these concerning the purpose of music. The Chinese, like the Greeks, have made the regulation of music an affair of the state, and their poets seem to be held to as strict an accountability as ever were the poet-musicians of Hellas for a truthful exposition of the moral,

political, and religious views held by the state. The Chinese definition of music which I have quoted, and all the other utterances of the sages, point to an early recognition of the scientific fact that music is intimately related to the emotional nature of man, and is, indeed, in a very significant degree its voice. When Herbert Spencer says that "variations of voice are the physiological results of variations of feeling," he only repeats in scientific language what the Chinese philosopher said poetically many centuries ago.

Like the Greek the Chinaman refuses to divorce music from poetry. The Greek dramatist was the prototype of Richard Wagner; he insisted on the most intimate union between words and music. One phase of this union is explained by the fact that the Greek drama was religious in its essence. The most proper medium of religious worship was of course that which, like religion itself, sprang directly from the emotional part of man. It is obvious that such an employment of music would exert a restrictive influence upon the religious chant that would operate as the most potent and enduring of conservators. As to the operation of the law of conservation in Chinese music I have something to say later. Now I wish to call attention to the fact that the Chinese drama is to-day in principle a lyric drama — as much so as the Greek tragedy was. The moments of intense feeling are accentuated, not merely by accompanying music, as in our melodrama, but by the actor breaking out into song. The crudeness and impotency of the song in our ears has nothing to do with the argument. It is a matter of heredity in taste.

But there is in China not only an intimate association between music and poetical speech, but also between music and speech generally. The Chinese being a monosyllabic language, it depends to a great extent upon musical intonation to convey meaning. If you listen to the conversation of your Chinese laundrymen you will discover that their ordinary speech is almost as musical as the *recitativo secco* of the Italian opera. Many words in the Chinese language take from three to six different meanings according to intonation. These intonations, as Dr. S. Wells Williams forcibly urges, have "nothing to do either with accents or emphasis." They are distinctly musical, and it is much to be regretted that Dr. Williams was unable, for obvious want of the musical talent, to study them from a musical point of view, as it is all but impossible to convey a clear understanding of their nature by description. There seem to be many variations, but generally there are four of these intonations, or *shing*, named and defined as follows: 1, *ping shing*, or "even tone"; 2, *shang shing*,

or "rising tone"; 3, *k'eu shing*, or "declining tone"; and 4, *juh shing*, or "entering tone." The Chinese have a "memory ruse" to help them to an understanding of these tones, which in English is said to run as follows:

The even tone — its path is neither high nor low;
The rising tone — it loudly calls, 't is vehement,
ardent, strong;
The declining tone — is clear, distinct, its dull, low
path is long;
The entering tone — short, snatched, abrupt, is
quickly treasured up.

So habituated are the Chinese to the tonal distinctions made by the *shing* that Dr. Williams says they will quicker recognize a difference of a tone in the pitch of a word than such a vowel change as from short *e* to short *i*, the consonants remaining the same. That is to say, a Chinaman marks a difference between

more readily than between

In illustrating the value of the *shing* and the confusion which might be caused by wrong intonations, Dr. Williams uses a sentence in English with misplaced accents, thus: "The *present* of that *object* occasioned such a *transport* as to *abstract* my mind from all around." The same writer gives also the clearest explanation of the *shing* which I have found.

The even (*ping*) tone is the natural expression of the voice.

In the sentence, "When I asked him, 'Will you let me see it?' he said, 'No! I'll do no such thing,'" the different cadence of the question and reply illustrate the upper and lower even tone. The ascending tone is heard in exclamatory words, such as "Ah, indeed!" It is a little like the *crescendo* in music, while the departing tone corresponds in the same degree to the *diminuendo*. The entering tone is nearly eliminated in the northern provinces, but gives a remarked feature to speech in the southern. It is an abrupt ending in the same modulation that an even tone is, but as if broken off. A man about to say "lock" and taken with a hiccup in the middle, so that he leaves off the last two letters or the final consonant, pronounces the *juh shing*.

Does not this help us to understand how it came about that music was not only recognized as one of the first aids to memory, and therefore laws and history were put into songs, but also that the sanctity which in primitive times came to be attached to the religious chant lay as much in the melody as the words, if not

BALLAD: "WANG TA-NING."

Allegro. *ten.*

p senza ped.
stacc.
secco.

sf Ped. *

p senza ped.

The first system of the ballad is in 2/4 time. The right hand (treble clef) features a melody of eighth and sixteenth notes, while the left hand (bass clef) provides a steady accompaniment of eighth notes. The system begins with a piano (*p*) dynamic and a staccato (*stacc.*) instruction. A tenuto (*ten.*) mark is placed over the first measure of the right hand. The system concludes with a fortissimo (*sf*) dynamic and a pedal (*Ped.*) instruction, followed by an asterisk (*).

ten. *ten.*

Ped. *

The second system continues the piece. The right hand has a tenuto (*ten.*) mark over the first measure. The left hand features a forte (*f*) dynamic. The system includes a piano (*p*) dynamic in the right hand and a forte (*f*) dynamic in the left hand. A pedal (*Ped.*) instruction with an asterisk (*) is present.

p *f*

The third system shows a piano (*p*) dynamic in the right hand and a forte (*f*) dynamic in the left hand. The right hand has a tenuto (*ten.*) mark over the first measure.

p *f* *f*

The fourth system features a piano (*p*) dynamic in the right hand and a forte (*f*) dynamic in the left hand. The right hand has a tenuto (*ten.*) mark over the first measure.

ff

The fifth system is the final system on the page. It features a fortissimo (*ff*) dynamic in the right hand and a forte (*f*) dynamic in the left hand. The right hand has a tenuto (*ten.*) mark over the first measure.

more? Plato found the Egyptian priests chanting hymns of so venerable an antiquity that the belief had grown up that they were the compositions of Isis. Other writers have contended that the temple chant of the Egyptians consisted of a repetition in a certain order of the seven vowel sounds of the language. If this is true, or even partly true, the inference would seem to be that it was a superstitious belief in the supposed efficacy of those sounds which preserved them. China affords us an instance by analogy. Although Buddhism has been one of the religions of China for two thousand years, and many of the sacred books of the Buddhists have been translated into Chinese, yet the liturgy of the Buddhist monks in China remains in Sanskrit. They spend hours chanting passages in Sanskrit, transliterated into Chinese characters, of the meaning of which they are absolutely ignorant. There are instances of the operation of the same restrictive law in the West. The newly converted Saxons before the time of Bede, for instance, were in the habit of reciting the Lord's Prayer as nearly as they could in Greek.

With these instances before us I think we can find an explanation of another of the paradoxes in Chinese music—the strange fact that with a theoretical system which gives them all of the tones which the Occidental system possesses, they stubbornly adhere to a scale from which the fourth and seventh are eliminated. Their practical scale is that called pentatonic. It is a singular fact that this is the scale of many of the oldest Scotch and Irish melodies. It is perhaps the most widely distributed of all tonal systems, as it is the most melodious; which circumstance, I fancy, goes as far as anything can to explain its prevalence. Try your fingers on the black keys of a pianoforte; given measure and rhythm you may wander about as aimlessly as you please, and so long as you stick to the black keys you will produce tunes that are agreeable to the ear. The ballad on page 450 will show the effect of the pentatonic scale in the melody; in the added harmony the tabooed intervals occur. It is the most graceful Chinese tune that I have found, and as “Occidentalized” in the arrangement would not sound out of place in one of our concert rooms. The Chinese seem to have a very arbitrary way of fitting words to music. The voice frequently drops out before the end of a musical phrase, and enters quite as unexpectedly, while the melody flows on in the orchestra with endless repetitions, relieved occasionally by half a dozen bars in which all the melody instruments cease and the gongs, cymbals, drums, and castanets play alone. I have paraphrased the words of the poem (“The Jasmine Flower”; see Williams's

“Middle Kingdom”), and in the first stanza have retained the quaint effect described.

Several centuries before the Christian era what is called the “circle of fifths” in European music was mentioned in China as a matter of ancient knowledge. Naturally it was also discovered by the Chinese that the fourth and seventh of the fundamental scale would have to be taken into consideration if new scales were to be evolved by the process of treating the fifth as a keynote. But they persisted in denying independent value to these two notes. Prince Tsay-yu once provoked a controversy by admitting the fourth and seventh to their rights in the scale. “Without these two semitones,” he wrote, “there can be no real music”; to which his opponents retorted, “To force these two semitones into the scale is like adding a sixth finger to the hand.” To understand how such an argument can have force it is only necessary to look into the fantastic symbolism and the theory of the mystical properties of numbers, which rest on Chinese music like a nightmare. Such things are obvious relics of primitive civilizations. The Pythagoreans recognized a relationship between the tones of their scale and the planets, wherefore we still talk of “the music of the spheres.” The Chinese philosopher goes much farther; he conceives each tone as a being, and fixes its attributes and forces it into his scheme of symbols with a nonchalance that is simply bewildering to the Occidental mind. Here is the ancient system with definitions and symbols as they may be found in a dictionary published by the Emperor Kang-hi A. D. 1680:

- F *Kung*, “The Emperor,” fundamental note of the scale; full of dignity and nobility; it symbolizes the planet Saturn, the middle (as a point of the compass), the stomach, earth, yellow, sweet.
- G *Tschang*, “The Minister”; severe; symbol of Venus, the west, the lungs, metal, white, autumn.
- A *Kio*, “The Obedient Subject,” gentle and mild; symbol of Jupiter, the east, the liver, wood, green, sour, and spring.
- C *Tsche*, “Affairs of State,” quick and energetic; Mars, the heart, fire, red, bitter, the south, summer.
- D *Yu*, “The Symbol of the All,” brilliant and splendid; Mercury, the kidneys, water, black, salty, north, and winter.

This is only the beginning of the symbolism in Chinese music. The twelve *li* or semitones in their theoretical system correspond to the twelve moons, or months, of the year. The keynote of each scale is looked upon as a man; the fifth as a woman; together they generate all the other tones. Six of the twelve semitones are male and perfect; six are female

A FUNERAL MARCH.

Con moto.

Sua bassa.

and imperfect. The tones are of eight kinds, because they are produced by the eight natural sonorous substances recognized by the Chinese, viz.: tanned hide, stone, metal, burnt clay, wood, bamboo, twisted silk, and the calabash. If a little thought is given to the influence of a system that forces sex and such fantastic attributes upon each tone, and requires all things to be correlated in symbolism, it will not seem so

strange that the Chinese have adhered to a pentatonic scale. Five is the most pervasive number in Chinese philosophy. The elements are five; planets, five; points of the compass, five; tastes, five; household gods, five; colors, five; viscera, five; constant virtues, five; ranks of nobility, five; and there are, I suppose, scores of other fives that I have never heard of.

With so many clogs hanging to each tone it

is not to be wondered at that chordal harmony is unknown in China, and that the only intervals recognized as consonant are the octave, the fifth, and its inversion the fourth. All the poetry of Chinese music is in its theoretical department.

To show what might happen if a national school of musicians with Occidental ideas and education should arise in China, I print some very old Chinese marches for which my ingenious young friend, Henry Holden Huss, has supplied grotesque harmonies, well calculated to emphasize the primitive character of the melodies. The first, page 452, upper, is the

Tayin, "Guiding March," which is played by fourteen musicians walking before the Emperor as he goes from the gate to the temple of Confucius at Peking to perform the ceremony of worshipping that sage. It is a piece of ancient ritual music. The dots above the notes indicate when the drummers and castanet players sound their instruments. The wedding and funeral marches, page 452, lower, and 456, are those played ordinarily in nuptial and funeral processions, when they are shrieked out by metal-belled clarinets that are a terror to the Occidental hearer. The composition on page 454 is a popular ballad.

H. E. Krehbiel.

NANNIE'S CAREER.

IT is now a year since I made my last visit to Tennessee, and I had then been away four years.

During the interval Strathboro' had gone over to the New South! I was surprised, and, it must be confessed, not wholly pleased. I had always supposed that Strathboro' would be the last place to come under modern influences. There is no chance for it to become commercial, and since the war it has droned along like a town in a dream. On this last visit I spent most of my time with Mrs. Caldwell, a cousin of my mother. When I entered her dear, big, dingy old house, by way of its absurd, majestic, wooden-pillared portico, and passed into its wide, dim hall, I was vaguely conscious of innovation in the air, and when I reached the guest-chamber, to which I was at once conducted, it burst upon me: here was the New South in the unexpected form of beribboned tidies, bits of draperies, things Kensington stitched, and a fancy crocheted rug lay on the foot of the great old canopied bedstead. I was glad they had not gotten rid of the bedstead; it had satisfied my earliest ideas of splendor.

I looked about me in sorrow, for all this array of fashionable fripperies seemed as foreign and out of place in Strathboro' as it would be on a Mexican hacienda.

"I see, Adeline, you are noticing my new things," said Mrs. Caldwell. "I suppose you see such a great deal handsomer in New York; but when I was on to the meeting of the W. C. T. U. in Minneapolis I saw how pretty Northern women made their houses, and ours looked so bare when I came back that I had Nannie learn some such work. I can't do any-

thing myself except the French embroidery we learned at boarding-school in my day, and it is n't the kind that 's the style now. It is a great improvement, is n't it? — brightens the old house up. Your Aunt Evelina has prettier things than I have; she went on to Minneapolis too. She was a delegate, from Boontown."

"A delegate?" I was greatly bewildered.

"Yes, from their branch of the W. C. T. U."

"The W. C. T. U. what?"

Mrs. Caldwell dropped her one hundred and seventy-five pounds into a chair, and stared at me, wounded amazement painted on her handsome, middle-aged, aquiline countenance.

"Adeline," she said. "Adeline," she repeated, "you don't mean to tell me that you have no interest in the Woman's Christian Temperance Union? — you living up there in the North where the glorious work is so much less obstructed."

"Indeed I have a great respect and a great deal of latent interest, Cousin Anne," I interrupted. "It has not come exactly in my way to know much about it, but I reported the proceedings of the meeting in New York one day, and they seemed to me curiously important and significant."

"You did n't join?" Cousin Anne still stared at me in touching melancholy.

"Why, no; it did n't exactly occur to me."

I saw Cousin Anne put by the temptation to lecture me immediately as if it had been a palpable thing visibly pushed; she did it with a sigh, and then devoted herself to her hospitalities, as one who had long recognized that she lived in the midst of a stiff-necked and froward generation. It was marvelous to see how these Strathboro' women — an important minority of them, that is — loved this organization. It was everything of important occupation, of wide interest, of expanded life, to them. Prejudices

of section, of sex, of society, went down before it. It was represented by women who could not be ignored or ostracized, and who banded themselves together for a sacred cause; and as they would do unheard-of things, old codes must needs burst to fragments, and the unheard-of be permitted. The men in their relation to the movement it was a joy to contemplate—there was something so primally and helplessly masculine and chivalrous in the big sheepish way most of them stood back, and lifted never a hand to stop proceedings such as all their lives they had declared, and believed themselves sincere in declaring, they would sooner die than permit.

I found my position in Strathboro' changed; hitherto, the fact that I was the daughter of my father and mother had caused the unknown mysteries of a New York newspaper woman's life to be graciously forgiven me and considerably overlooked, but now everywhere there was a new and vivid interest in what I may sum up as Advanced Womanhood, and advanced womanhood, alas! I was considered to represent. Our present concern with all this lies in the fact that Cousin Anne's eighteen-year-old daughter, the most domestic, conservative, well-ordered little creature I ever saw, was predestined by her mother to join the ranks of advanced womanhood, and I was expected to assist at the sacrifice.

During my stay with them Cousin Anne was visited by her sister, Mrs. Framley.

Mrs. Framley was generally spoken of as "a character," and she enjoyed living up to her reputation. Her own children were all sons, and she always tacitly assumed the absence of daughters to be a proof of her own superior good sense; but naturally this state of things gave her the greater freedom of opinion as to how less admirable people should manage theirs. The second day after she came she opened up the subject of Nannie.

"Anne," said she, pinning the shirt she was making by hand to her knee, and stitching energetically, "why has n't Nannie got some beaux? I've never seen a sign of a young man about the place. What is the matter? She is pretty enough."

Cousin Anne was writing at a little table, attending to business for the W. C. T. U. She did not answer for a moment; then she said, a little stiffly: "St' Ellen" (abbreviated form of Sister Ellen), "I don't intend Nannie to waste her time on beaux; she's got enough to do attending to her studies. I'm having her keep them up; I have not let her come out yet."

"Come out! m-m-m. You and I never did come out, Anne; but when we were girls we managed to have a mighty good time," and first or last half the young men in the county

were courting us. If there is anything better worth a girl's while than that, I've never heard of it."

"I propose that Nannie shall find things better worth the while of a rational being in such a world as this," Cousin Anne replied.

"I never heard before that Nannie or any other girl of eighteen was a rational being. I pity her if she is. Do you mean her to be an old maid?"

Cousin Anne sealed an envelop with elaborate care. This was an essentially uncomfortable question: every inbred prejudice and many native sentiments rose up within her against the suggestion; and yet every instinct of expression, of moral dignity, of ambition, tied her to the course she had vaguely blocked out, and it was certainly not a part of that program that Nannie should marry soon; and how was it to be supposed that the strange, triumphant, world-manipulating creature Nannie was to become could ever be accommodated within the matrimonial harbor? Something like this in chaotic, dim form distressed her mind, but she stuck on a stamp with decision, and finally said:

"I don't know whether or not she will ever marry, St' Ellen, but at least she shall have my help to become a noble woman, helping the world onward."

"A noble woman! O Lord! I'm a noble woman, Anne; only you'd never see it, just because I've got common sense. Well, well! Yankee notions down here must be a mighty sight worse than they are at home, for somehow or another they do seem to keep on marrying up there, and the girls have some little frolic, to judge by what I hear, before they go into the business of turning the world upside down. Are you going to make a preacher, or a W. C. T. U. lecturer, out of Nannie? She's got such a gift of gab she'd do for either one."

Dear Cousin Anne's Roman features were touched with an infantine grief, and the tears came to her fine eyes as she said, "I did n't think you'd ever make fun of Nannie, St' Ellen; I thought you admired her being so quiet."

"So I do, so I do, Anne," said the softened sister; "but that's the very reason I don't like to see her spoiled and kept out of her natural amusements. What are you going to do with her anyhow, right away, next thing?"

Cousin Anne resumed her air of dignified firmness, and replied that Nannie was going North with me for the winter.

"What are you going to do with her when you get her up there, Adeline?"

"Cousin Anne thinks she will have a good chance to look about her and choose some work or profession to devote herself to."

"Upon my word!" Cousin Ellen abandoned the shirt, and dropped her hands into her lap. "Why, the child's got enough to live on, and I reckon that's all she asks."

Just then Nannie, looking very young and pink and pretty in her white frock, came to the door.

The mother gave her sister a warning glance.

"I won't do any harm," was the direct reply. "Come in here, Nannie child; you don't think your old aunt will bite, do you?"

The girl put her hand into the one outstretched to her with the manner of a good child.

"So you are going off to Yankeeland, are you? and get to be a strong-minded woman, like Adeline here?" Nannie smiled sweetly upon me.

"What are you going to do up there, honey?"

"Mamma thinks I'll know better when I get there," said Nannie, a faint shade crossing her face.

"Go fetch me a drink, in the big gourd; that's a dear. Well, Anne," she continued, when the girl was out of hearing, "you and Nannie are about as precious a pair of babes in the woods as ever I saw. But, after all, Adeline's not as big a fool as she looks, and I reckon you won't do anything worse for the time being than waste money and spoil Nannie's fun; I don't believe Adeline's friends—the men all seem to be fifty or older—will be very lively for her. And I should think," she added maliciously, "you'd be afraid they would undermine her principles; there don't seem to be many W. C. T. U. people among 'em." But Cousin Anne had talked all this over with me, and had settled her course.

I wrote to my friend Amy Milman, a young painter who shared my little flat, to engage a certain bedroom from our neighbors in the front apartments, and I came on North with Nannie.

Amy, who knew something of the state of the case, met her with maternal graciousness, and then took me aside, closed a door upon us, and asked what in the world I intended to do with her.

"I don't intend to do anything," I declared; "I am simply the tool of circumstances. Probably she will stay here awhile, and go home all comfortably enough and take up the life that suits her there."

"No, she won't," stated Amy, with solemn emphasis. "We are aiding—you are, that is—and abetting in unfitting one human creature for life. She won't belong anywhere after she's tried an independent existence here awhile. She'll be neither fowl, fish, nor flesh."

"Well," I pleaded, "don't try to wake up my conscience about it all, Amy dear; it can

do nothing but distress me. I said all I could to Cousin Anne. I wanted this visit to be regarded as just an outing, a lark; but no, the child has been loaded down with the obligation to find a life-work. And by that her mother means what she calls a career, something at once dazzling and —"

"What did her mother say when you talked with her?"

"Say? Why, asked how I should like to marry and live in Strathboro' all my life myself; and told me that Nannie is very literary in her tastes, more so than any girl in her class, and that one of her essays had been published in the Strathboro' what d'you call it weekly, and that she loved to see a woman eager to help on her sisters, and —"

"Stop! Do you think she's got a bit of talent for anything in the world?"

"Not an atom, that I can discover, except — what is it James says? — the talent for being the nicest of little girls."

"Maybe if she has not a bit it won't be so bad. Don't worry, anyhow, you poor girl. Go bring her into the sitting-room and we'll have some tea, and I'll give you some newspaper stuff."

Alas! poor Nannie had never drunk tea in her life, and I think the very sight of us engaged in such a curious rite increased her homesickness. She was, of course, terribly homesick, everything — our little rooms, our way of life, our talk, the very outlook from the windows — was all so crushingly strange. She was benumbed for weeks, and her one comfort, her mother's letters, were after all but a sorry comfort, for they bristled with questions as to the progress of her ambitions for the future. Poor Nannie! I think at last she began to realize what an awful thing it is to be asked to make a career offhand, as it were. It was worse than Miss Havensham's demand that her little visitor should play. But Nannie was a self-contained little soul, and at last escaped from her worst throes, and began to come into relation with the life around her without having unbosomed herself to anybody. She came down with me to the office of the "Appeal" several times, and sat hours in that grimy sanctum, very proper as to attitudes and very natty as to dress, but she voiced no impressions, and gave utterance to no opinions as to her fitness for journalism. I was bound to be grateful for that. She also spent hours in Amy's studio, and I thought it would be much better for her to go in for painting than for writing.

"Why?" demanded Amy, argumentatively, defensively.

"Oh, it will give her time," I said. "There is a regular way of studying it. No one expects to succeed in that at once. Her disappoint-

ments and mortifications will reach her so much more slowly. She could even spend a lifetime, under favorable circumstances, putting away at it, and not be much the wiser as to her unfitness."

But she said nothing as to taking up painting. Cousin Anne wrote to me to ask if it was not time she was concentrating herself, if her life-work had not yet disclosed itself. I pleaded for time for her.

Nannie was too honest to play at a vocation; she evidently took her position with fearful seriousness.

It took me seriously. It was beginning to weigh upon me like a nightmare, when one evening brought at least the relief of fresh developments. Carlton Darby, a painter whom Amy professionally adored, and who took an interest in her and her work, came in to spend an hour with us. I, too, had a great liking for Carlton Darby, both professionally and personally. He was a big, simple, quiet creature, who never seemed to have discovered the fact of his own existence, though he had a delightfully fresh eye for the existence of a good many other things.

Nannie was brought in, of course, and listened with her usual perfect decorum to his and Amy's interchange about backgrounds and foregrounds and color motives and modern feeling. He handed her a cup of tea—she had learned to sip that beverage by this time—and he shook hands with her when he went away, but he did not seem to have really seen her, a fact that is little credit to those powers of observation I have remarked upon. Nannie's perceptions were the better subject for praise this time. As I toasted myself over our one open fire after Amy had gone to bed, Nannie came and sat down by me. After gazing long into the sinking coals she broke the silence by saying:

"Mr. Darby is a great painter, is n't he?"

"He's a mighty good one anyhow," I answered. It always seemed natural to talk Tennessee to Nannie.

"Does he take pupils?" she asked.

"Dear me, I'm afraid not. However, I don't know but he might. Do you want to study with him?"

"It seems as if I must be making up my mind, does n't it, Cousin Adeline? Mamma thinks I'm wasting the winter, and she counts on it so. I think I'd like to paint better than anything I know of. Mr. Darby makes it so interesting when he talks about it, does n't he? He made me feel like I understood, though it's all mixed up in my mind now. Do you think I could ever paint any, Cousin Adeline? I was such a good scholar at school, except in arithmetic and algebra: you would n't need them in

painting, would you? But up here I don't seem as bright as mamma used to think I was."

The gentle little mouth looked dangerously tremulous, and I hastened to steady it with a kiss, and to declare that we'd see at once if she could not have lessons from Carlton Darby.

At least that was better than having her plunged into medicine, which was Cousin Anne's latest suggestion. I went to see Mr. Darby the next day. Amy was so inhumanly full of her sense of the sacredness of paint that I knew she would be no effective ally, so I went alone to the pleasant old workshop studio. The painter, in his shirt-sleeves, opened the door. He gave me a chair in silence, gravely put on his coat as if he were performing some sacred rite, and then sat down on a three-legged stool in front of me.

"How are you, and how is Miss Milman?" he asked, after a moment's delay, when I did not, as usual, find a way to open the conversation myself.

"I wish you'd ask about the other member of our household," I exclaimed. "It would give me a chance to begin what I have to say!"

"The other mem—oh, the little Tennessee girl. Yes, I remember her now."

"Do you think you remember her well enough to be ready to take her as a pupil?"

"A pupil?—in painting." The accent was not reassuring. "Now Miss Addington, you know—hold on, though, I don't know. There is a girl here, Miss Rosamond Giles—do you know her? She's got talent, the real thing. She's wanting to study with me, and her people won't let her unless I have a class. Your little girl would make a class, don't you think? I'd like to teach Miss Giles; I think I could do a good deal for her. She's done some quite stunning little things already. Your—what's her name?—Miss Caldwell could come along and learn what she could. What is she taking it up for? Oh, well, I don't suppose it will do her any special harm. Send her along. I'll find out when Miss Giles can come. Her mother said she'd consent if I had some other pupils, and I guess one will do."

"Do you think Darby is at all in love with Rosamond Giles?" I asked Amy when I got home. "He seemed quite filled with enthusiasm about teaching her. He never thought of Nannie except as a means to that end."

"Miss Giles is a mighty gifted young painter, worse luck to her!" murmured Amy, as she went on making dabs at the canvas before her, and dividing scowling stares between it and her "arrangement" at the other end of the room.

Owing to Mr. Darby's special interest in Miss Giles, Nannie had the privilege of going to the studio every day. She spent three hours

there, and the heavenly bodies were not more prompt and constant in their movements than was she.

I did not suppose Mr. Darby and Miss Giles cared to be disturbed by a visitor, and was glad enough to find a reason for dismissing Nannie in her would-be professional capacity from my mind. So, as Cousin Anne was satisfied, and the child seemed contented, I bothered not a whit as to what she was doing. I supposed it was nothing; but in that supposition I stupidly failed to take account of those powers of self-defense with which naturalists tell us every creature is, in some fashion, endowed.

About ten weeks after the lessons began there was a rap at my door late one night, and Nannie came in, looking uncommonly blooming and softly bright.

"I have something to tell you, Cousin Adeline," she said, stopping in the center of the room, with her proper little hands clasped together before her belt, and her gentle eyes fixed mysteriously upon mine.

And, if you please, her news was that she was engaged to be married to Carlton Darby.

How ardently I embraced her, with what respect I gazed at her; I felt a sense of gratitude to things in general.

How well the old solution still served, after all. What a loosening was here of the hard knots which the march of civilization, the evolution of society, and a misguided parent had been tying for those patient small fingers.

Conversation with Nannie was impossible: she was mute and deaf, absorbed in her own emotions; so I tucked her away in her bed—she was staring out into space with shining, unseeing eyes when I turned out the gas—and betook myself to Amy.

Not to have patronized the enthusiasm that waked her from her first nap would have been more than human.

"My dear girl," she began, "do I hear *you* talking as if marriage were a convenience? One would think you had just gotten the eldest of seven plain daughters off your hands. And you always think so much about your social problems: this is not an answer, it is just an accident."

Then dropping this affectation of a coldness no woman ever felt at such news, she broke forth:

"But how do you suppose it came about? He

certainly has not courted her here; I never gave him the chance—the few times he has come. I did n't suppose he cared to speak to her. When he comes to see you to-morrow I'd claim it as my right to know all the details, if I were you. He'll think that is customary if you tell him so; I know he will. But what are you going to say to Mrs. Caldwell? How about your stewardship? This is n't advanced womanhood."

I replied that at least Nannie had taken highly independent modern ground in conducting her matrimonial alliance; her mother would have to take that as her contribution to the cause of universal emancipation.

I did not derive much information from my interview with Mr. Darby. He sat in our little parlor, looking ridiculously large and radiant and quiet, and seemed to find all talk superfluous. He was as finely unapologetic as possible, but he did ask me in the undertone of an aside if he ought not to write to Mrs. Caldwell. Mrs. Caldwell gave no trouble. She took a somewhat grieved, reproachful tone for a time; but Mr. Darby was an eligible man, so far as Strathboro' standards could be applied to him, and the inherent delight of seeing a daughter happily married really overflowed all the superficial ambitions of her later years, and even, I doubt not, cheered her under the affliction of Mrs. Framley's satisfaction in the turn of events. She did write to Nannie and to me that at least in thus marrying a painter Nannie would be enabled to continue her study of art; but Nannie said to me, with that complete conclusiveness that even the veriest mouse of a woman assumes in such situations:

"Mr. Darby does not wish me to try to paint if I don't want to, and I don't think I do. He wants to paint me, and he says a sympathetic model is half a painter's battle, and I would rather help him that way."

Meanwhile Amy, roused to an exceptional and praiseworthy interest in contemporaneous human life, had speedily visited Miss Giles for the express purpose of hearing what she could of Nannie's courtship. Miss Giles could tell her very little; but this ignorance was in itself highly interesting, for she was just recovering from a four weeks' illness, of which, if you will believe me, the Machiavellian Nannie had told us never a word.

Viola Roseboro'.

HEART LONGING.

OH, come to me once more! for all in all
To me thou art—
The flower, the summer fountain, to recall
Joy to my heart.

Give me one hour beside thee as of yore,
And when 't is flown,
With strength renewed will I go forth once more
To be alone.

Constantina E. Brooks.

AT THE TOWN FARM.

ALTHOUGH it was not Sunday, but Saturday, I was none the less

... drest all in my best
To walk abroad with Sally;

but our walk savored not at all of romance, for I was a small child, and Sally was our spinster help.

I gloried exceedingly in my bonnet, though it was a burdensome decoration, requiring frequent pulls to keep it from settling heavily on my shoulders. It was a "drawn bonnet" of pink silk, an elaborate structure of much cording and many rattans, garnished with "uncut velvet," and graced with an ample cape and a pair of swan's-down "tabs." It was made by our village milliner, whose style of trimming was of a stiffness which, according to rustic comment, suggested the wrappings of a sore finger. Friend Hopkins was a consistent "member of Society." Though she earned her modest living as a dressmaker and milliner to the "world's people," her fit and finish were in subtle accord with the strictest principles of the sect; for they were of a sort to make the renunciation of pomps and vanities no very painful sacrifice.

Sally was keeping "Seven Day" holy by wearing her best bonnet and shawl, the former a cumbrous pile, thatched, as it were, with straw, and bedecked with ragged bunches of very frankly artificial flowers, mixed with a judicious proportion of stiff bright green grasses; the latter, a more seasonable article, was a heavy wrap from the mills of our own valley; while she wore her white yarn mittens instead of the blue mixed ones of ordinary use. The sun, which on our coast often shines kindly even in mid-December, had withdrawn his countenance from us within the last few hours, and a raw northeast wind was blowing. Our destination was a neighbor's house, where we were to spend the day, after our little walk of two miles and a half. We passed through the village, or, more exactly, we stopped at the village store of an errand. My recollections of this intellectual center persistently bring before me sundry rows of glass jars ranged on shelves and sparsely filled with sticks of candy colored a fervid red; while on the counter stood a large pitcher of coarse brown earthenware, always generously brimming with water of a sub-tepid temperature; and I suspect that my infantile

consciousness was pretty evenly divided between these two equally attractive objects. But nothing so caught my notice this morning as the appearance of the stranger who hurried past us on the road leading out of the village. Sally read him off at once as a seafaring man just home from a good cruise; and with the gleam of African gold in his earrings, and the indefinable air of adventure that hung about him like foreign spicery, he answered very acceptably to my idea of Blackbeard the pirate.

We made our way across the fields, Sally soberly plodding over the frozen ground; I jumping ecstatically at the brittle joy of each new discovery of some freshly silvered patch of thin ice that glassed the tiny hollows among the tussocks of the pasture. There was a wild, champagne exhilaration in the tinkling ring of each newly shattered crystalline mirror, and I rejoiced in the invitations of the tempting "break-ins," as country children call them, until I rushed upon one that beguiled me into a very gloomy profound of mud.

"Cat's foot, young one!" exclaimed Sally, with an expletive of no great appositeness to my drenched and undainty condition, meanwhile extricating me with no gentle hand; "I might knowed if there was ary a bog-hole betwixt Cubit's Hill and Ponder Zeke's Corners you 'd go and slump into it. Wa'n't there no sink-dreen to your pa's, that you must come so fur to get muddied up?" she bitterly demanded. "Look a' them pantallets, now," cried Sally, in rising wrath, to which I supplied an echo of vociferous sobbing, "put on spandy clean this mornin', I vow and declare! Uh done crying now," she ordered, adding, with swift generalship, "and come right over to the town farm. Mebbly Miss Beech 'll let me wash and dry for ye; she loves so to accommodate."

Seeking the hospitalities of the town farm dwelling was no new experience to me, and I came to recognize it afterwards as once a place of condition, stately with a row of Lombardy poplars, in which frequent gaps now showed, and enduring with its solid prop of a vast chimney. But it had fallen into the same estate as its occasional inmates of gentle birth, and access was easy by its rudely fenced borders up the windy hill to the old farmhouse, gray-toned as a hornet's nest, but hiving only the harmless drones of our village swarm. I had made acquaintance with the "beasts and

all cattle, worms and feathered fowls" of its barn-yard, and I had also been an awed spectator of the glories of the best room, and will still make myself sufficiently at home in it to say, in no guarded terms, that I have never, even in dreams, seen a more wildly improbable wealth of vegetation than rioted over its walls. Festoons of yellow cabbages balanced to big bunches of blue roses, and all the fruits of an agricultural fair, blushing with every impossible hue, joined in the maddening dance. The paper was one of those that may be assigned to a certain period in the evolution of provincial taste to be known as Early Decorated. Its marvels filled my untutored mind with a savage admiration that I stoutly withheld from the specimens of that succeeding period which might be styled Late Glacial, being marked by the use of cold blue-gray papers, with high white lights, in frigid affectation of the tone of hard-finished walls. Further embellishments of life were such as the keeper of the farm had bought for a song at some auction sale of the effects of his unfortunate guests. The three-decker "what-not" of those days, loaded with a motley cargo of the native bric-à-brac, mixed with bits of barbaric beadwork from Niagara and mounted fragments of the Charter Oak, made the chief figure. In every village parlor the same clumsy craft, as it seemed, bore down upon you with the identical freight of which you had just made an invoice in your last visit. The central ornament of the room was a table coldly bare except for an elaborate mat of much bunched Berlin wool and many gilt beads. From this frivolous setting rose the solemn lighthouse tower of an astral lamp, very brassy in foundation, very cumbrously enriched with globe and shade in superstructure, and very forbidding of aspect if regarded as anything but an imposing edifice.

Not for us, on this occasion, were the chilly splendors of the best room. Faint-hearted and forlorn (I speak at least for myself), we presented ourselves at the kitchen entrance, where we were met first by the overgrown cade-lamb, which, from the door-stone where he had been lying, bleated with a serious, watch-dog air, then, reverting to his untought manner, playfully butted at us. Next we received the welcome of the goodly Mrs. Beech, whose very-horn comb reflected benevolence as she espied my wretched plight.

"Bless us and save us!" was the pious formula which she deliberately pronounced, while Sally twitched me by the sleeve, with the vigorous protest:

"Stand where ye be, can't ye, young one, and don't go a-dripestonin' all over Miss Beech's clean floor!"

"Never mind, Sally, nev-er mind," consoled my hostess, while I stood dissolved in my muddy bath, salt tears and sweat of shame mingling on my cheeks; "the little gal's nigh about drowned, and scared to death besides. There, there, sissy," she soothed, while she lent a kind hand in aid of Sally's impatient ministrations; "I guess you 'm no worse scared than what I was time I went down the pond. I've lived alongside the pond all my days," she soliloquized, "and I never went on to the water but once in my life, when I was n't more 'n sixteen year old, and brother 'Lisha he teased me to go off with him just to sail a piece, and then he up and went clean down to the breach, and scared me so 't he said I hung on to them timbers till I squeeze the sap out 'n 'em. Makes me trimble now to call to mind what a fear-nought 'Lisha was," she pensively meditated.

"Maria Anna Hadleigh," Sally addressed me with cold emphasis, "you climb up on to that bandy-legged table so 't I can see where you be, and you set still there and be thankful you 'll get some dry duds on ye to rights."

"Hey, little gal!" cheerily demanded my host, who arrived upon the scene with much stamping and beating of chilled feet and hands, "what you be'n up to? Gettin' out tug, hey?" he added, as his slow glance traveled to my muddy shoes.

"Hush, father!" remonstrated Mrs. Beech, as with an incorrigible jester, while Sally affably commented upon the whirling eddies of dry leaves and spirals of dust that swept by the closing door.

"Kind of a dry northeaster, ain't it, Mr. Beech?" she questioned.

"Ye-es," assented that authority, rather automatically; then rising to rhetoric, he continued, with bold personification, "sort of a he northeaster, I call it; it don't bring forth nothin'," and forthwith disappeared into the outer kitchen.

"Well, and how be you gettin' along this winter, Miss Beech?" queried Sally, mindful of the civilities due from guests.

"Well," returned our hostess, with a sigh that spoke of care, "it makes me shake in my shoes to think of that Lib Dow and her three young ones comin' on the town, as father says they be; but howsomever—Bread, how do you prosper?" she genially queried into the recesses of the brick oven, before dropping into the rush-bottomed rocker and adjusting her knitting-sheath—"but I guess I 'll have to say, as Old Lady Penneek preached it to the old squire's wife when she went down to Penneek's to hide away from the coast-guard because they wa'n't very pleasant-spoken to Tory folks. Old Lady Penneek had folks in

Newport that belonged to the Sons of Libbuty, and says she to her gals, 'Do, Lyddy, tell Polly to tell Dilly to tell squire's wife to put her trust in the Lord'; and I guess I shall have to put my trust in the Lord." Arriving at this desperate conclusion, with another portentous sigh, heaved from the billowy amplitudes of her person, she called resignedly to her husband, who was busy in the next room, where the inmates were feebly pottering at the monotonous work of dipping candles.

"Let her come in now, father; might 's well. Se' down, Cuddy; and, nef you want to," she invited, "set right down and smoke your pipe," beckoning to a tremulous black crone with monkey features and a shock of whitening wool.

Fascinated by the regular succession of Cuddy's puffs, accompanied by sundry recurrent mutterings, I was suddenly aware of an uncertain grasp that feebly dealt with my shoulder, while a gaunt, livid face bent closely over mine.

"Let the little gal be, Nabby," ordered Mrs. Beech. "She won't harm ye a mite, Maria Anna; it 's only Crazy Nab," she explained, reassuringly. "She 's only a-lookin' everywhere for her little gal, that her folks has kep' to home. Go in t' other room, Nabby," she directed; and the furtive, gliding creature, with a spaniel-like air, crept to the open door, and hung wistfully on the threshold, gazing at me with an eye that quickly grew dim and vacant; then, tidying her rough hair and smoothing her tattered gown, she began to sing wildly.

"There, Nabby, that 'll do, now," interrupted Mrs. Beech; "you 've sung her off to sleep, and now you go lay her down in the cradle"; and Nabby disappeared with a delighted alacrity.

"She 's real peaceable to-day, ain't she?" commented Sally.

"Lor', yes!" replied her guardian, "she 's so good to-day you mought tie her up in knots; but there is times when she has her tantrums. There 's that bound boy that 's come on the town this fall; he 's a terrible make-game, and he plagues the poor critter shameful. But Nabby don't aggravate me so much by half as Old Maid Sary Jenkins doos. There she goes now," as a tall, lean figure appeared in the yard and began a peacocking march by the window, fussing with a dragged train and pulling at a battered "flat," an expansive straw structure governed by a bridle that held it down over her face and gave to the arrangement the engaging air of a *yashmak*. A malicious sort of head-gear, it was capable of heightening the mere simper of adolescence into the grin of idiocy, and of imparting to

the mature wearer the expression of a senile Bo-peep.

"Love-cracked, wa'n't she?" Sally sententially queried.

"Well, I do' know," returned Mrs. Beech, with an exasperated air. "If she wa'n't a natural-born fool, she's every bit and grain as redic'ulous as one. When she took a notion to Tommy Reed, and he sort of shabbed her off (she wa'n't very fanciful, I expect), she went kind of shackled in her wits. I s'pose she always was kinder wantin'. I can't make her do no work. It 's more work to stand over her than 't is to do it yourself. She just sets up chamber and mopes. Last winter there come a spell when the sleighs was a-flyin' pretty spry, an' Old Maid Sary she sot up there by the window as you mought be a-settin' now, a-sithin' and a-groanin', and a-writin' of her poetry. She always goes to writin' some kind of mournful poetry when she 's clear down. Well, along in the arternoon she brung me them lines she writ:

The bells they do jingle,
But still I am single!

"'Sary Jenkins,' I told her, 'I 'm ashamed on ye!' for the 's times when I go right on talkin' to her just as if she could sense things. 'If that 's all you got to complain of, there 's plenty would be for changin' of places with ye.'" Mrs. Beech gave the quotation from herself with a fresh outburst of the disgusting scorn that had been provoked by the sentimental vagaries of her guest. "'You 'm got a roof over ye, and clo'es to kiver ye and to sleep under, and victuals enough to eat, if you be single, and that 's more than some double folks has got, if they ain't on the town. If you ain't got no very near relations, there 's some that 's real good to ye' (her cousin Hannah Ann come to see her on'y the week afore, and fetched her an old noospaper and a raw quince), 'and if you 'd be'n married a dozen times you mought 'a' come out o' the little end o' the horn just the same. The more love the worse luck, says I; look a' Billy and Dolly now.'"

"Well, Billy he 's gone," interrupted Sally, with satisfaction. "Had a kind of a fit, I expect, wa'n't it?"

It must be the insatiate demand in the rustic breast for the sensational that precludes the idea of disease or departure, in young or aged citizens, undiversified by "fits."

"Yes, Billy he 's gone, and Dolly — why, Sally Crandall! — what, ain't you heard? Yes, Dolly went out like the snuff of a candle. The fun'l would 'a' be'n to-day, and young Elder Jakeways he was a-comin' over, but now it 's put off till to-morrow. Father he 's dug a real nice grave out in the pasture. I kind o' thought

one grave for both on 'em was just about right. They was the fondest old folks that ever lived."

"Was it old Billy and Dolly Rogers that come to live here?" I struck in, greatly interested.

"Yes, deary, bless your heart and soul alive!" fervently responded Mrs. Beech, recognizing a sympathetic listener, while Sally, with due regard to the solemnities of the recital, contented herself with but a moderate sniff of chastened scorn, while observing that "of all the foolish matches betwixt foolish folks, that was the greatest she ever see — pity us if it wa'n't!"

The two venerable shades had moved before me almost as vaguely in life as in death, though Sally had taken me once and again to their crazy dwelling. I suppose that if eons had rolled over their ancient heads they could not have seemed farther removed from me. I remember Billy as an emotional reader of some waif of a newspaper, nodding with delighted emphasis at every sentence. Dolly was rheumatic, and I sat gazing with a child's horrid curiosity at her poor lame foot, which was swathed to an enormous size. She nursed it upon a ponderous cushion, which might have been rheumatic too, it looked so swollen and unhealthy. I am afraid that kind old ladies cannot measure the unkempt savagery that disgraces the imagination of their ruthless young guests.

The couple were always known as Billy and Dolly, never receiving, even in their old age, or from their youngest friends, the saving titles of uncle and aunt, which village courtesy usually bestows upon its wards. Their perpetual childhood was tacitly recognized in every demonstration of neighborly regard. They had persisted in the romantic temper that had inspired their witless love-match fifty years before. All they ever made out of it was the love, as their prudent friends commented, without a suspicion that possibly they might have found that love was enough.

"The house was anymost ready to drop down over their heads," related Mrs. Beech, "and the Council did n't get them out on it none too quick. I felt real queer to see them walk into that there door, for they was always real nice folks, and never used to rough-scutt, like some o' the lot the' is here. They always was respected, though they never was forcible, and made such a poor fight on it, gettin' married as they did, for Dolly wa'n't no deeper than the well, and Billy was sort o' queer, and used to go ridin' an old ox down to the stores. 'T made folks say he was a little off; but anyway, if 't was my last breath, I should say they was the thankfullest-minded, lovin'est old folks ever you see. Don't you know, they was always just that way; when anybody took

them anythin' he would speak up so kind o' hearty, 'Never can be thankful enough for all favors,' and look to-wards Dolly to see what she 'd say. Them dear old souls! I loved to do for 'em."

"They named their girl Thankful, I 've heard tell," observed Sally.

"Yes. Well, she was took away from the evil to come, though mebbly if she had lived her pa and ma could 'a' be'n takin' their comfort. When folks is old, and never was very powerful to work, and gettin' feebler every day, and nothin' comin' in, why, if the' ain't no childun, the' ain't nothin' *but* the town farm; and Jonathan never was nothin' but a torment to them. He never was fit to carry his father's old shoes after him. Billy always was an innocent, good kind o' man, and did the best he knowed how, and when that Jonathan run off to sea I said to my husband, says I, 'Father, I don't see why such good, pious folks should be visited with a reprobate son'; for he was a vessel of wrath, if ever there was one. Well, I suppose it 's all right they should be took away."

"Blessed release, I should say," chimed in Sally, chafing under any other view, and with an animation that only such references aroused in her. Was Sally a veritable Death incarnate, stalking abroad in a thinly disguised grimness? Certain it is that nothing whetted her appetite and spurred her cravings like news of mortality. Let the stroke light where it might, she justified it eagerly and gloated over it exultantly.

"I went to put an extry comforter over them one night," continued Mrs. Beech, "and I see Dolly had got somethin' all hugged up to her, and what under the canopy but an old rag baby! 'Gimme that old thing, Dolly,' says I; 'I'll put it away for ye.' And I coaxed her to leave go on it; but Billy spoke out, sort o' gruff, 'Let her be,' says he; and he give me to understand that when Dolly begun to have them queer spells nothin' would do but she must get out that old rag, that she fixed up for her girl; and she 'd talk to it, and cry over it, and doze off with it on her arm, and dream 't was her little live baby that 's dead and buried down to the old Quaker meetin'-house yard, 'most thutty year ago, I guess. Queer her mind run so on that teenty-tawnty gal, for when she did n't have them turns 't was Jonty that she and old Billy was forever a-talkin' about. You 'd 'a' thought, now, to hear them go on so innocent, that Jonty must be second mate by this time. They 'd set up there so chipper, and the folks all round a-listenin' like everythin' (for they thought all the world on 'em); and a-tellin' how Jonty 'd be home afore long, and a-go-

in' over the letters they 'd had (and them was precious few, I guess); for they always believed he 'd come home some day, like the prodigal, and nobody could bear to say no to it—must had a heart harder than rock dunder if they could. That old sailor that 's be'n here quite a spell—Cap'n, they call him; that old lame feller—he 'll swear like a pirate oftentimes, but you 'd oughter seen him cudunkin' with Billy, perlite as Lucifer, and layin' out when Jonty would get back, and listenin' just as pious when Dolly raised a hymn tune of a Sabbath. They 'd all be still as a mouse in the cheese, for all they ain't much of meetin'-folks that comes here, as a gin'rul thing. Billy used to sing with her. I 've heard tell 't was his singin' that Dolly took to first along, for you know her folks was better off than what his was. Well, 't was kind of a new thing to our folks here to have such doin's, and they wa'n't none so heathenish but what they sensed it; and when Billy got up there, with his long white beard, so sort o' clean and nice, and Dolly with her best cap on, and a real sweet look to her face, the folks would all be as good as pie. I told the young elder I 'd always heard Billy and Dolly was fools, but I b'lieved they was missionaries. 'Sister Beech,' says he, 'the world would say they might be both.' Yes, they was all fond on 'em, and they 'll miss 'em—say, did n't you hear old Cuddy groan just now? Never knew her to groan afore when she had her 'backy. Sally, don't you wonder where Jonty Rogers is now? Hunduds o' miles away on the ocean, I s'pose, if he ain't down to the bottom of it. If I could see him I 'd let him know what I thought of him pretty quick—that poor old man that 's dead and laid out in the next room, with nothin' to leave behind him but such a son as that: but they never said a word, and you 'd thought he was the most devotedest. I kep' takin' notice Billy got weaker day arter day, till he was just a-totterin' round, tryin' to save steps for Dolly and keep her up, for his mind was set on their goin' together. 'Don't want to live no longer than Dolly doos': he hung to that as stout as could be, and I 've heard tell he 'd said so ever since they was man and wife; and Dolly she 'd bring it out with a kind of a quaver to her voice, 'Sha'n't be here long when Billy 's gone.' It was solemn to hear 'em. You know how sudden he went off with the lung fever; but he roused up afore he died, and says to Dolly, 'When Jonty comes': but he never got no furdur, for he dozed off then, and never spoke ag'in. Dolly had one o' them spells come on, and did n't seem to take no notice,—we thought she did n't,—but after awhile she begun to whisper to her-

self, and, 't was queer, she never called him by name once, but always, 'My dear husband!' then she 'd say, under her breath, 'Gone! Gone!' And she 'd go all over the house lookin' everywhere, and sayin' them words over and over, sca'ce above a whisper. It was real pitiful; she acted as if she 'd got lost, and nobody could get to her. She did n't notice nothin' but just our old cade-lamb; he was real fond o' Billy, and he 'd come round Dolly, and it seemed, somehow, as if them two cre'tur's knowed more 'n we could tell 'em. I put Dolly to bed last night like a baby, and this mornin' she 'd never opened her eyes, but passed away as easy as any babe. Don't you want to see them, Sally—and bring the little gal too."

Sally accepted the invitation, and we entered the chill room where the old couple were laid. I was lifted up to gaze at the still, white, sleeping faces. Very calm and gentle they looked, and as if some peaceful presence smoothed their brows; yet a strange awe stole over me.

"Do they go to sleep all the time?" I asked, uneasily, for this was my first sight of death.

"'Sh!" signalled Sally; and I stopped, not to waken the sleepers.

"Don't you know no better than that, little gal?" mildly instructed Mrs. Beech. "They 'm gone to heaven."

Thus suddenly confronted with spiritual mystery, I was led from the room, silenced and quelled, but inwardly nursing an obstinate skepticism.

"Come, Maria Anna, come!" bustled Sally. "Time we was on the move."

But we lingered as Mr. Beech appeared, announcing, with a curious air of perturbation, that a strange man was coming up the drift-way.

"Him? Why, I seen him afore," commented Sally, unimpressonably. "I seen him this forenoon travelin' out on the west road to-wards Abram's Plains."

We had just left the house as he paused before Mr. Beech, mechanically tendering a rude salute, which our host met with an unresponsive stare.

"I footed it out to the old place," spoke the stranger, with hesitation; "but it was pretty nigh gone. Part of the old chimblly was down, and some sheep had took shelter in the keepin'-room. It—it—come on to me all to once so—I reckoned I 'd got here long afore this, but wind and weather was dead ag'inst us the latter eend o' the v'y'ge. I see a little girl playin' round there, and she told me the old folks was—here." He brought the word out huskily. "Mr. Beech, where be they? I come ashore to do for them the best I can."

"Yes, Jonathan Rogers," stammered Mr. Beech, grasping his hand with an agitated heartiness; "they expected you all along; yes, Jonathan."

The smart of an honest pity lent a curious awkwardness to Mr. Beech's attitude, as he stood divided between hospitality and apprehension.

The stranger shrank slightly from the cold wind, and shivered again, as if with a deeper chill.

"I want to see the old folks; I want my mother!" he stammered bruskiy, with an eagerness that struggled pitifully with shame.

There was a silence, which I interrupted.

"You can see the old folks," I announced, planting myself before him. "I saw them just now, in the front room. They've lain down and covered up their faces to go bye-byes, but Mrs. Beech says they've gone to heaven," I ended, debatingly.

Mrs. Beech, with a smothered cry, hid her face in her apron, and rocked her body back and forth. The sailor started, and made an uncertain step. Mr. Beech caught him, and drew him within, and Sally and I followed him with our eyes as the keeper opened the door of the silent room for him and closed it after him.

Esther Bernon Carpenter.

CALIFORNIANA.

A California Lion and a Pirate.

[THE lady Maria Antonia Pico, who afterwards became the mother of General Manuel Castro and Don Juan B. Castro, was born in Monterey, in 1802. She told to her children and grandchildren the following story of the arrival of the privateer Bouchard, who frightened all the Spanish settlers in 1818. The story is given here exactly as taken by me from the lips of an old Spanish woman in Castroville, who had often heard it related by Mrs. Castro, the mother of the general.—CHARLES HOWARD SHINN.]

It was about the middle of November, 1818, and I was sixteen years of age. A vessel brought the report to Monterey that a whole fleet of pirates were coming. Every one, in great fright, commenced to move and hide the most valuable things. Carts were used to carry them to the ranches. My father was not at home, but my mother and I packed many articles in rawhide bags, to send them twelve miles inland to the *cañada prieta*, or black ravine. My brother, sister, and myself went with the carts; mother was to come next day, with a servant. Night came on before we fairly started, and it began to rain, for it was late in the year, and the first frosts were in the deeper cañons. As we went on the rain grew worse; the oxen wanted to turn about because of the rain in their faces, but we three children pushed on to carry out our mother's orders. About midnight we reached a large, broken oak tree where our mother had told us to camp. We let the oxen loose to graze, and crawled under the cart, wet to the skin.

My little sister was afraid of bears in the chaparral. I tried to comfort her, but she would not listen; she was sure we would be eaten up, and at last her persistence frightened my little brother till he cried out. In an hour or so they went to sleep beside me, but I lay awake and wished that my father and the men-servants had been at home. They were all in the hills, gathering up the cattle. Though I had been over the road many times, it had never before seemed at all dangerous. While I was thinking of these things a wild, strange noise was heard approaching, and one of our oxen, running through the thicket, fell over the

tongue of the cart, rose, ran a little way off, and again fell, with a scream. I knew that something must have attacked the animals; I believed it was a big bear. We heard the other ox rushing into a gulch, and we all three sat up and said our prayers to the saints, to be delivered from *El Feroz*, which was the name the hunters had given to a very large and dangerous grizzly that was known to roam about this cañon of the broken oak. I did not remember it until we had camped there, or indeed until the oxen made such an uproar, but now I was very sure it was nothing but *El Feroz*.

The morning was dawning when this happened, and in a few minutes I could see a hundred feet down the cañon. An indistinct form began to be revealed here, and I hushed the children to watch and listen. There, as we soon saw, was a large California lion, or puma, pulling the meat from one of our oxen. Then I hoped that mother, and José, the peon, might soon come along the trail. José, who carried a gun, and was a brave man, would kill the wild animal, but we could see no one to help us. I whispered to the others to lie still, because we had no place to hide in, nor was it any use to try to climb a tree, for the California lion will climb like a cat. So we saw the lion finish his meal on our ox. It grew very light, near sunrise, before he took any notice of us, where we sat under the ox-cart. As soon as he saw us he walked up very close, with a curious, wondering expression on his face, and went all about the cart, looking us over, and making a purring sound. We sat close and had our arms about one another, but we did not say a word. He then came up so close that I felt his breath on me, and finally he put his nose against my ankle. I had no stockings on, only home-made shoes, and his nose felt very strange, and made me expect to be eaten up at once. But I thought it best to lie still, and not cry out. After what seemed a long time, the lion went back and lay down by the dead ox, about a hundred feet distant, keeping his eyes on us most of the time. He sometimes walked around the ox; then he went off a little way to a spring; then he came back and walked around the cart. At last he lay down again by the ox, shut his eyes, and seemed

asleep. The sun was now high, and we were very hungry and thirsty, but when we moved a little to rest our limbs the lion opened his eyes and looked very bad.

We lay there under the cart all the morning, and until about the middle of the afternoon, and the lion lay under the shade of a tree, watched us, ate some more beef, and went to the spring as often as he chose. Then about three o'clock mother and José, the peon, came down from the coast way, and when they were on the ridge they could look into the cañon and see the whole situation at a glance—the lion, the dead ox, the cart, and the three of us huddled together under it. José ran forward and fired two shots, wounding the lion, but he got away in the rocks.

Since one of our oxen was dead, and the other had escaped, we hid our goods as best we could in the bushes. Then mother told me, as we made a camp, that she had forgotten a family book, with writing of her father's in it. It was on a shelf in the house, and she wanted to ride back to obtain it. I told her that I was not afraid to go; so, after we had our meal, I mounted her horse, and galloped off for Monterey. After a little time I heard a cannon shot, then another, and then a great many. I thought that now the pirates had come, and would perhaps land, and burn the town and our house; so I rode faster. At last I reached the *loma* near the Plaza de Doña Brigida, and there were boats and men on the beach. Some of the houses were on fire, and that seemed dreadful. I turned a little and rode across the ridge, and down a cañon to our own house, which was about a mile from the beach, and I ran in and found the old book where mother said, and wrapped it in a piece of calfskin to tie behind the saddle. But when I went out of the door I saw my horse running off, frightened at the noise of the firing.

It was very hard to know what to do. There was no other horse at the house—all had been turned loose. I ran over a little hill to the next ranch house, but all the people had gone. Then the firing stopped, and pretty soon I heard a band of music, and the next minute a man dashed by on horseback and shouted to me that Ignacio Vallejo was a prisoner and that all the people had fled. I determined to catch a horse somehow, but just as I was planning how it might be done two men came out of the bushes and spoke to me. They were armed strangers, and very wild, so I fell on my knees and prayed them to do me no harm. One of them asked me my name, and why I was there; so I told him and showed the book, but I did not reveal the course to our other ranch. He laughed and said I was a good girl, and he sent his man to catch my horse. Then he dismounted while I still knelt there by the doorway of the deserted *adobe*, hardly believing my own eyes, and he came up to me and kissed me on the forehead and called me *Señorita*, which frightened me very much. Then the man came up with my horse, and I looked at the leader of the two, and asked what he was going to do with me?

He looked at me and swore a great oath. "My girl," he said, "you are more brave than some of your people were on the beach when we landed. You shall go back." He put me on my horse, and kissed my hand, and said, "Ride fast; there are others of Bouchard's men who would not treat you so well." I thanked him briefly, and he added as he let go the bridle that his name was Pedro Condré, and that he already

had two wives on board his ship, or he would have taken me there. This last saying made me ride in great terror and with frightful speed down the gulches and up the hills. When I reached mother's camp I was crying, and so terribly excited that I could not say anything but "Hasten, hasten!" We left all our things hidden in the bushes, and went on to the Salinas. We met many families of fugitives. For nearly two weeks we lived in huts near the river, but early in December the frightened people began to move back to Monterey.

The padres had the floors and walls of all the houses sprinkled with holy water before any one would live there again. At Christmas time the good padre called me out before the congregation and gave me a gold cross because of what he called my courage with the lion and with the pirate. It does not seem to me that I was very brave, for I only took things as they happened, but I was very much pleased with the cross and the words of praise.

[After the narrative of the late

Maria Antonia Castro.]

A Carnival Ball at Monterey in 1829.¹

The first carnival ball that I ever attended took place near Monterey about 1829, when I was *Señorita* Brigida Cañes. I do not remember my age at the time, but I think I was about eighteen. I was invited by a friend in Monterey to visit her, as she had arranged to give a carnival ball, as was the custom of the country. I left my home with the usual attendants at about eleven o'clock the day before, for our ranch was many miles distant. We met numbers of persons going to the party, all on horseback, and full of gaiety and youthfulness such as only a race that lives outdoors in such a climate as California, and without cares or troubles, can show. The pranks of the gentlemen were so numerous and so amusing that it makes me laugh now to think of them. Every one could ride perfectly, and could pick up a leaf or a flower from the ground as he galloped past. Good riding was expected as a matter of course. On this occasion they all had red, black, and green paint (for the most part colored earths, powdered), and *cascarones* (egg-shells filled with finely cut gold and silver paper), and vials of different colored liquids, all harmless. It was the great sport to ride against each other, each endeavoring to stain his opponent's face while himself escaping. As we neared Monterey the carnival spirit grew wilder, and the ladies' dresses and faces suffered, but we all took it in good part.

On our arrival at the ranch near Monterey where the festivities took place we found every one already dancing. The assembled guests, rushing to us, lifted us from our horses and led us in, smearing our faces with more paint and breaking *cascarones* on our heads with much laughter, while we defended ourselves in the same manner. It was my first experience of so wild a scene, and the red, green, and black paint on my face made me uglier than a Yuma Indian. But as long as others were in as bad a case, I could not complain.

A few minutes later a Mexican colonel came in and was immediately surrounded by ten or twelve ladies,

¹ See "The Cascarone Ball," by Mary Hallock Foote, in *THE CENTURY* for August, 1879 (Old Series).—EDITOR.

and in a moment his face, cravat, and vest looked like a rainbow. There was a severe struggle between his politeness and his dignity; but he remembered the old adage, yielded to the inevitable, allowed himself to be carried by the whimsical current, and played his part in the grotesque farce. I also had a little courage, and I went up and cracked a cascarone on the young officer's head, but he was so busy rubbing the paint from his face that my faint-hearted attack passed unnoticed.

Next came the old *alcalde* of Monterey, a very stiff and dignified man. The first one to attempt to meddle with him was the governor's secretary, who was so awkward that he hurt the *alcalde*'s face, and they retired to the courtyard of the ranch-house. This frightened the hostess, who feared a quarrel, and she went out at once. Of course their warm words stopped immediately and they came in together, but the old *alcalde* kept his face and dignity unchanged the rest of the night and no one lifted a cascarone against him.

The next arrival was a beautiful lady, almost a stranger to us all, but known in Monterey as "*La Española*," because she had recently come from Spain. She came to me, and in a very sweet voice asked me to uncork a cologne bottle that she carried in her hands, which I in my simplicity did. Then every one laughed as she sprinkled me from head to foot with the contents. She came in an elegant ball dress, but in a moment the roses and lilies of her beautiful face and neck were hidden under red, black, and green paint laid on heavily. She broke many cascarones, and she also had two bottles, one of cologne for the ladies, and one of scented ammonia for the gentlemen who were most conspicuous in the assault. At last she made her prayer, "*por el amor de Dios*," and every one ceased, with gracious bows and smiles, leaving her to put on her dancing slippers.

All this was in the afternoon. Then we washed our hands and faces and sat down to a banquet in the old adobe. After that came more dancing. The annual carnival ball was a great feature of the social life of the times, and often lasted all night. The wild revel of the earlier part of the ball was succeeded by the most courtly behavior.

Brigida Briones.

A Spanish Girl's Journey from Monterey to Los Angeles.

EARLY in the winter of 1829 my father, who had long expected an appointment under the governor, received a letter from Los Angeles saying that his papers were in the hands of the authorities there, and would only be delivered in person. He decided to take my mother and myself with him and go overland, without waiting for the yearly vessel from Yerba Buena which would soon be due at Monterey, where we were staying. It was nearly Christmas when we began the journey. Word was sent ahead by a man on horseback to some of the smaller ranches at which we meant to stop, so that we were expected. A young American who had reached the coast with letters from the city of Mexico heard of our plans, and came to my father to ask if he might travel with us to Los Angeles, which was easily arranged. He did not know a word of Spanish, and I have often laughed at some of his experiences on the road, owing to his ignorance of our ways and speech. At one house the *señora* gave him some fruit, whereupon he handed her two reals, which she let

fall on the floor in surprise, while the old don, her husband, fell upon his knees and said in Spanish, "Give us no money, no money at all; everything is free in a gentleman's house!" A young lady who was present exclaimed in great scorn, "*Los Ingleses pagar por todos!*" ("The English pay for everything.") I afterward told the American what they had said, and explained the matter as well as I could, but he thought it a foolish thing that no one, not even servants, would take money for services. We several times met grown people, and heads of families, who had never heard any language except Spanish, and who did not know, in fact, that any other language existed. They were really afraid of our American, and once I was asked if there were any other people like him.

Our route took us up the Salinas Valley and over the mountains to the coast valleys and the Missions. At San Miguel we found everything prepared for a jubilee over the prosperous year. The men walked about and fired off their carbines and home-made fireworks, while the *padres*' servant swung a burning oaken brand in the air, and lighted a few rockets. Inside the church the Indian choir was singing. We saw it all, until about ten o'clock that night; then the *alcalde* of the village came with fresh horses, and we went on, as it was very pleasant traveling.

The young American picked up some words in Spanish; he could say "*Gracias*," "*Si, señor*," and a few other phrases. One day we passed a very ugly Indian woman, and he asked me how to ask her how old she was. Out of mischief I whispered, "*Yo te amor*," which he said at once, and she, poor creature, immediately rose from her seat on the ground and replied, "*Gracias, Señor, pero soy indio*" ("but I am an Indian"), which gave us sport till long after. The next day our companion gave me a lesson in English by way of revenge. It was the day before Christmas, and we had reached San Buenaventura. It was a holiday for every one. After mass all the men and boys assembled on horseback in front of the church, with the *padre* and the *alcalde* at their head. They rode about in circles like a circus, fired guns, beat drums, and shouted. I thought it was very fine, and by signs I asked my American friend how he liked it, and he answered, "Dam-fools!" with such energy that I supposed they were words of praise. Indeed, I used the bad words as very proper English for a year or two, until I learned better, when I was of course much mortified.

When near Los Angeles we had the nearest approach to an adventure of our whole journey. We spent the night at a ranch-house. As I was the young lady of the party, the hostess gave up her own private room to me. At the end of it was an alcove with a window, and in front of the window stood a shrine, with wax figures of the holy Virgin and the child Christ. Before them were vases, and fresh wild-flowers from the hills—the golden poppies, the first blue "baby eyes," and the white "star-flowers," that bloom at Christmas time.

To judge from appearances the only shrine to which our host was devoted was the cockpit, for the courtyard of the adobe was fairly lined with rows of the "blooded birds" so popular at that time with many wealthy *rancheros*, each one tied to a stake by his leg, and being trained for the battlefield. The young American, who, like many other foreigners, took up with our bad customs more easily than with our good ones, was

greatly delighted when he saw the rows of fighting cocks in the yard. He offered to buy one, but the owner thought them too precious to sell. At last, by signs, he wagered a dollar on the homeliest of the lot. The host, accepting the wager, released his favorite. Instead of fighting, the two birds went through the window into the room I had occupied, and that with such force that there was a crash, and a mixture of feathers, wax saints, and flowers on the floor. Our host turned pale, and rushed in to disentangle his pets, while the American jumped up and down on a porch, shouting, "*Bueno! bueno!*" The birds were now fighting in earnest, but the host separated them, gave them to a servant, mounted the saddled horse which always stood ready, day or night, and, with a faint "*Adios*" to me, disappeared. He knew what he was about, as events proved, for the rage of his wife when she saw the broken shrine was something terrible. The moment she came on the scene she cried out, "Where is he?" and going into the inner courtyard she began to release the game-cocks, which hastened to hide in the nearest shelter. The next morning, when we took our departure, the master of the house had not yet returned, and the mistress was endeavoring to restore the shrine.

Amalia Sibrian.

A Glimpse of Domestic Life in 1827.

THE ladies of Monterey in 1827 were rarely seen in the street, except very early in the morning on their way to church. We used to go there attended by our servants, who carried small mats for us to kneel upon, as there were no seats. A tasteful little rug was considered an indispensable part of our belongings, and every young lady embroidered her own. The church floors were cold, hard, and damp, and even the poorer classes managed to use mats of some kind, usually of tule woven by the Indians.

The dress worn in the mornings at church was not very becoming; the *rebozo* and the petticoat being black, always of cheap stuff, and made up in much the same way. All classes wore the same; the padres told us that we must never forget that all ranks of men and women were equal in the presence of the Creator, and so at the morning service it was the custom to wear no finery whatever. One mass was celebrated before sunrise, for those whose duties compelled them to be at work early; later masses took place every hour of the morning. Every woman in Monterey went daily to church, but the men were content to go once a week.

For home wear and for company we had many expensive dresses, some of silk, or of velvet, others of laces, often of our own making, which were much liked. In some families were imported laces that were very old and valuable. The rivalry between beauties of high rank was as great as it could be in any country, and much of it turned upon attire, so that those who had small means often underwent many privations in order to equal the splendor of the rich.

Owing to the unsettled state of affairs for a generation in Mexico and in all the provinces, and the great difficulty of obtaining teachers, most of the girls of the time had scanty educations. Some of my playmates could speak English well, and quite a number knew

something of French. One of the gallants of the time said that "dancing, music, religion, and amiability" were the orthodox occupations of the ladies of Alta California. Visitors from other countries have said many charming things about the manners, good health, and comeliness of these ladies, but it is hardly right for any of us to praise ourselves. The ladies of the province were born and educated here; here they lived and died, in complete ignorance of the world outside. We were in many ways like grown-up children.

Our servants were faithful, agreeable, and easy to manage. They often slept on mats on the earthen floor, or, in the summer time, in the courtyards. When they waited on us at meals we often let them hold conversations with us, and laugh without restraint. As we used to say, a good servant knew when to be silent and when to put in his *cuchara* (or spoon).

Brigida Briones.

A Letter from General Sutter.

THE following letter from General Sutter to Governor Alvarado has been furnished us for publication by the kindness of the family of the latter. It gives a glimpse of the relation of the two men in 1841. The "body of American farmers" referred to were evidently the party whose experiences General Bidwell has narrated in the November CENTURY, the "young man" being "Jimmy" John.

A su Excelencia Señor Don Juan Bautista Alvarado, Gobernador Constitucional de las dos Californias, en Monterey.

EXCELLENT SIR! Allow me to write you this time in English, because I like not to make mistakes in an expression.

I have the honour to send you with this an Act, of a committed Crime on this place; please give me your Orders what I have to do with the Delinquent which is kept as a Prisoner here.

Delinquent Henry Bee was put in Irons, but his friends bound themselves for 1000 Dollars Security, when I would take the irons from him, in which their Wishes I consented.

John Wilson, Black Jack, is well known as at life he was a bad Character, which may be something in Bee's favour.

Waiting for your Orders, I shall keep the Delinquent in Prison.

The Trapping party from the Columbia River will be here in about 8 Days, under Command of Mr. Ermtinger. I am also waiting for one of my friends a German Gentleman with the same party, I believe he travels for his pleasure.

A strong body of American farmers are coming here; a young Man of the party got lost from the party since 10 Days, nearly starved to death and on foot, he don't know which Direction the party took, I believe he will come about the Direction of the Pueblo.

I was also informed that an other Company is coming stronger than this under Mr. Fanum [Farnum].

Some very curious Rapports came to me, which made me first a little afraid, but after two hours I get over the fit.

I remain, Excellent Sir!

Very Respectfully

Your

Most Obedient Servant,

J. A. SUTTER.

NUEVA HELVETIA, November 4 de 1841.

P. S.—In a short time I will have a Secretary who is able to write Spanish.

TOPICS OF THE TIME.

How to Develop American Sentiment among Immigrants.

WHATEVER individual opinion may be on the policy of restricting immigration, or however public sentiment concerning this question may shift, there can be no difference about the desirability and the necessity of making good Americans of those already here or certain to come. That the country still makes demand for strong, healthy men and women is not open to doubt, and it is almost equally clear that the supply must come, now as ever, from the countries of Europe.

It is important, therefore, to consider the conditions that surround the humble people of other lands — “who are seeking to convert obstacle into opportunity, and wrest achievement from difficulty”—who find here their place and their work. They are not criminals, or suspects, or paupers, or anarchists, or socialists, or disorganizers. They have no intention of joining the ranks of the so-called “dangerous classes.” They are simply plain people brought up in the fear of God, and with a desire and a necessity to earn an honest living by their labor.

They learn in due time that here, with universal suffrage, residence means citizenship. They attach themselves to one of our great political parties, moved thereto, as others are, by association, interest, or opinion. They may not know much about the complicated institutions under which they must live; but they are teachable, willing, and anxious to learn. In the case of adults, their schooldays are over; so that they cannot by this means be fused into our life, with its new customs, manners, and ideas. They were born to conditions greatly different from those in the home of their adoption. They come from countries where the distinctions of classes are sharp, and where the requirements of standing armies impose burdens which have no existence here. But it must not be forgotten that while the latter are burdens, they also insure a discipline not to be acquired from our customary modes of life.

Among our foreign-born population there is no characteristic stronger than the desire to become real American citizens. From their earliest days here the majority of them manifest this. In many cases they want to pass as Americans, not as foreigners, and there is less of a desire to associate only with their compatriots than is charged to them. But in all this they are confronted with serious difficulties. Their fortunes must of necessity be cast for a time with their own countrymen, from whom they learn whatever they can of their new environment. They are desirous of becoming active in our politics, not merely as office-seekers or office-holders,—although they furnish their full quota of these,—but as interested persons, anxious to contribute to the proper settlement of great and important questions. It is in this that they need help, as, indeed, do thousands of our native-born citizens.

It is pertinent to inquire what we are doing for these people. How are we training them for their new du-

ties? To whom do we turn them over without so much as a thought? What is the school in which they must learn what they can about our system of government, and who are their teachers? As a rule, being a humble people, they find themselves forced into tenement or crowded residence districts. From the time they declare an intention to become citizens they are courted by politicians. In many cases they get their training from demagogues, who themselves are without any clear or just ideas of our political system. They may make their way into the political clubs or organizations to be found in all large cities. Often their countrymen who have preceded them, many of them with personal ends to serve by the control of votes or the assumption to control them, lead them hither and thither. The man who supposes that any considerable proportion of these hard-working immigrants would, of their own motion, procure illegal naturalizations, or practise other frauds upon the suffrage, does not understand their character and purposes. They are ignorantly led into wrong-doing by reckless schemers.

Without direction many of these people fall into the hands of labor agitators, few of whom are both intelligent and disinterested. Many of them are designing men, some are demagogues, and still more are themselves ignorant of American principles and institutions, crude in their ideas of political economy, and solicitous mostly for the promotion of personal ends. Even these men need instruction, and many of them, if compelled day by day to meet arguments supplied to their now helpless followers by such agencies as those proposed, would soon become ashamed, and themselves become pupils instead of assuming to be teachers or leaders.

The statement is made from time to time that we are admitting great masses of socialists. The number is exaggerated, and more importance is attached to the utterances of these than they deserve. It must be admitted, however, that some of them know just enough to be dangerous. But they are permitted to go among their fellows, to inculcate them with whatever doctrines they choose, and there is nothing to oppose them. Nobody has furnished their hearers with arguments, or taken steps to teach them that in America, where conditions are fairly equal, no necessity exists for the violent agitation of these questions. But train bright young men among these immigrants to know what their duties are, teach them their rights, put at their disposal arguments with which to meet the specious assertions of self-styled and talkative leaders, and the much-vaunted dangers of socialism would disappear.

It is time to inquire what citizen or organization of citizens, with unselfish and patriotic motives, meets these new citizens and carries into their humble homes some knowledge of their new environments, political, industrial, and social. Is there any society, either in the large cities or in the sparsely settled communities where they find homes, which tries to teach them what

the Constitution of the United States is, or the history of the country in which they are to pass their lives? ¹

The question must have a negative answer. They are left without the protection and knowledge such persons could give them. As a rule, they are given over to that inexorable law of supply and demand which makes no terms and knows no mercy. There are organizations in almost every city to defend, without cost, humble working men and women from imposition on the part of their employers. These do much good. But is there any reason why the mental needs of these people should not have similar aids? Why should not these men be taught what it really means to be an American citizen? This work is made the more easy because of the tendency of immigrants towards cities. Even this is only a natural drift, because it is there that association and opportunity are to be found; it is there also that the bad elements of humanity abound; it is there that temptations multiply, and it is there that the people subjected to them need help.

But who gives it? In what schools or lecture-rooms do these young men find teachers? There are plenty of charitable institutions, there are almshouses almost without number, and every kind of asylum for the unfortunate. These, however, profess only to alleviate physical suffering or promote bodily comfort. There is no reason why good people in every community should not associate with the purpose of giving aid to the people who need it so much. Few of these future citizens know anything about the elementary principles of our republican system; they know almost nothing of federal, state, or local government, and still less of the distinctions between them. They soon learn something of the language,—the child's power to make known wants,—but their knowledge of its literature is scanty. The most promising among them do not acquire much, the dull little or nothing; but with guidance and instruction, with the helping word and the kindly aid to be given by unselfish men and women, these courageous young persons, already here and certain to be made or marred as American citizens, will learn what they most need. They will find that bad and costly government may come as the result of their want of knowledge, and that they themselves must in the end bear more than their share of burdens, ignorantly or corruptly imposed. They will find that they have it in their power to promote honest politics and good government; that they have obligations as well as rights.

The churches do much, but they need help. These people are poor and ignorant, and are subject to every earthly temptation, so that the churches and the clergy find their task more and more difficult. In order to supplement the work of existing agencies, night schools and lectures, designed primarily for the instruction of foreign-born citizens, might be instituted in every large city in which these elements find a refuge. Young men and women of leisure and cultivation would thus find employment of a kind befitting their character and training, and would in this way be able to make some return to government and society for the benefits they themselves have enjoyed; while the good they would do to aspiring citizens—to the men who
